Editor's Notes

During summer 1997, we experimented with a one-month "moratorium" on new manuscript submissions to the *Review*. This was done because of the difficulty of providing an efficient review process for new manuscripts received during the summer (due to the frequent unavailability of editorial board members and reviewers) and the need for some time for vacations, long-range planning, and catching up with any lags in our production schedule and other editorial office responsibilities. The moratorium was very successful in allowing us to achieve these purposes. As we received a higher than usual number of new submissions just before and just after the moratorium, it appears to have worked well for all concerned. We are therefore following the same procedure during summer 1998, with the month of August designated for this purpose. Thus, authors wishing to submit *new* manuscripts should mail them to arrive by the end of July or the beginning of September. The return of reviews and the processing of invited revisions are *not* affected by this policy; those are handled expeditiously whenever received. The editorial office remains open throughout the summer; we will continue to process revisions and to prepare accepted manuscripts for publication, to correspond with authors about their manuscripts, and to process all new manuscripts received prior to August 1.

INSTRUCTIONS TO CONTRIBUTORS

General Considerations

The *American Political Science Review* strives to publish scholarly research of exceptional merit, demonstrating the highest standards of excellence in conceptualization, exposition, methodology, and craftsmanship. Because the *Review* reaches a diverse audience of scholars and practitioners, contributors should demonstrate how their analysis illuminates a significant research problem, or answers an important research question, of general interest in political science. For the same reason, authors should strive for a presentation that will be understandable to as many scholars as possible, consistent with the nature of their material.

Manuscripts being submitted for publication should be sent to Professor Ada W. Finifter, Editor, *American Political Science Review*, Department of Political Science, Michigan State University, 303 South Kedzie Hall, East Lansing, MI 48824-1032. Correspondence concerning manuscripts under review may be sent to the same address or, preferably, by e-mail to apsr@ssc.msu.edu. Please note that the *APSR* will not process *new* manuscripts during August 1998. *New manuscripts* should be mailed to arrive either before or after this period. *Invited revisions and reviews* may be submitted at any time and will be processed upon arrival.

The *APSR* does not consider papers currently under review at other journals or that duplicate or overlap

with parts of larger manuscripts that have been submitted to publishers. Moreover, since space is at a premium, submission of articles substantially similar to articles submitted or published elsewhere, or to part of a book or other larger work, is strongly discouraged. In general, this is a self-policing norm. If there is doubt about whether the policy would apply, authors should discuss any such related publications in a cover letter to the Editor; copies of related publications may be requested.

For manuscripts containing quantitative evidence and analysis, authors should describe their empirical procedures in sufficient detail to permit reviewers to understand and evaluate what has been done and, in the event the article is accepted for publication, to permit other scholars to carry out similar analyses on other data sets. For example, for surveys, at the least, sampling procedures, response rates, and question wordings should be given; for experiments, full descriptions of experimental protocols should be provided. It is desirable for articles to be self-contained, and authors should not refer readers to other publications for descriptions of these basic research procedures. As part of the review process, authors may be asked to submit additional documentation if procedures are not sufficiently clear; the review process works most efficiently if such information is given in the initial submission. If readers are advised that additional information is available from the author, printed copies of that information should be submitted with the manuscript. If the amount of this supplementary information is extensive, please inquire about alternate procedures.

Manuscripts that are largely or entirely critiques or commentaries on previously published articles will be reviewed using the same general procedures as for regular articles with one exception. In addition to the usual number of reviewers, such manuscripts will also be sent to the scholar(s) whose work is being critiqued, in the same anonymous form as they are sent to other reviewers. Comments from the original author(s) to the editor will be invited as a supplement to the advice of regular reviewers. There are several purposes for this notice to the original author(s): (1) to encourage review of the details of analyses or research procedures that might occasionally escape the notice of disinterested reviewers; (2) to enable prompt publication of critiques by supplying critiqued authors with early notice of their existence and, therefore, more adequate time to reply; (3) as a courtesy to critiqued authors. Authors of critiques should therefore send as many additional copies of their manuscripts as will be required for this purpose.

Manuscript Formatting

Manuscripts must not be longer than 45 pages *including text, all tables and figures, notes, references, and appendices*. The page size guideline is based on the

U.S. standard 8.5 X 11 inch paper and *must be adjusted accordingly by authors who are submitting manuscripts printed on longer paper*. Font size must be at least 10 point for all parts of the paper. The entire paper must be double-spaced, with the sole exception of tables for which double-spacing would require a second page otherwise not needed. All pages should be numbered in one sequence and text should be formatted using a normal single column no wider than 6½ inches, as is typical for manuscripts (rather than the double-column format of the published version of the *Review*), and printed on one side of the page only. Include an abstract of no more than 150 words. The *American Political Science Review* style of embedded citations should be used, and there should be a separate list of references at the end of the article. Please do not use footnotes for simple citations. These specifications are designed to make it easier for reviewers to read and evaluate papers. Papers not adhering to these guidelines are subject to being rejected without review.

For submission purposes, authors are encouraged to place notes at the bottom of the pages instead of at the end of the manuscript and may locate tables and figures (on separate pages and only one to a page) approximately where they fall in the text. However, manuscripts accepted for publication must be submitted with endnotes, and with tables and figures on separate pages at the back of the manuscript with standard indications of text placement, e.g., [Table 3 about here]. In deciding how to format your initial submission, please consider the necessity of making these changes if your paper is accepted. Authors of accepted manuscripts are also required to submit camera-ready copy of graphs or other types of figures. Instructions will be provided.

The *American Political Science Review* citation format requires inclusion of month, season, or issue number (in that order of preference if a cited journal provides more than one) as part of the volume and page identification. For example, a reference to an article in the *Review* would be given as 90(September): 475–87, rather than 90:475–87. On other questions of form, please follow the example of a recent issue of the *Review*. For unusual style or formatting issues, authors may refer to *The Chicago Manual of Style*, 14th edition.

Submission Procedures

Please follow these specific procedures for submission:

1. Submit *five* copies of manuscripts. *Please review all pages of all copies to make sure copies are complete and that all pages are legible.* To comply with the *Review's* policy of double-blind peer reviews, four of the submitted manuscripts should have no identifying references. The first page of the four anonymous copies should contain only the title and an abstract of no more than 150 words. If it is important to the development of the paper that an author's previous publications be cited, whenever possible this should be done in a way that does not make the authorship of the submitted paper obvious. This is usually most easily accomplished by referring to oneself in the third person and including

normal references to the work cited in the list of references.

2. The first page of the identified copy should contain the name, academic rank, institutional affiliation, and contact information (address, telephone, fax, e-mail) for all authors and, in the case of multiple authors, an indication of the author who will receive correspondence. In the event that any relevant citations to the author's previous work have been omitted from the anonymous copies, they should be included in the identified copy. If the identified copy does contain any unique references or is worded differently in any way, please mark this copy with "Contains author citations" at the top of the first page.

3. Please also send a loose copy of a page containing the full title of the article, the names of all authors, and the abstract.

4. Authors having access to e-mail should send a copy of the abstract to apsr@ssc.msu.edu, when the submission is mailed. The subject line should contain the word *Abstract* followed by the first listed author's last name. The body of the message should contain the title of the paper, the names of all authors, and the abstract (as on the loose page described above). E-mail submission of the abstract is not required but will help us process your manuscript more efficiently.

5. Authors should not fax abstracts, send any part of the paper itself by e-mail, or send the abstract by e-mail before their submission packet is in the mail.

No copies of submitted manuscripts can be returned.

Since submission procedures may be modified from time to time, authors are encouraged to check for current instructions in the most recent issue of the *Review* or at our Internet web site, <http://www.ssc.msu.edu/~apsr/>.

BOOK REVIEWS

All book review correspondence should be sent to the Book Review Editor, Professor Mark Lichbach, *American Political Science Review* Book Review, Department of Political Science, University of Colorado, Box 333, Boulder, CO 80309. (E-mail: apsrbook@colorado.edu.) Authors wishing their book to be considered for review should ask their publisher to send a copy to the Book Review Editor. Those interested in reviewing books should send their vita to the Book Review Editor.

OTHER CORRESPONDENCE

The American Political Science Association's address, telephone and fax are: 1527 New Hampshire Avenue, NW, Washington, D.C. 20036, (202)483-2512, and fax (202)483-2657. E-mail: apsa@apsanet.org. Please direct correspondence as follows:

EXPEDITING REQUESTS FOR COPYING APSR AND PS ARTICLES FOR CLASS USE

The APSA already has an agreement with the Copyright Clearance Center (CCC) whereby bookstores and copy centers can receive expedited clearance to copy articles from the *APSR* and *PS* in compliance with the Association's policies and applicable fees. In regard to these permission fees, there is no charge for the first ten copies of an article. Any additional copies are 75 cents each. The Copyright Clearance Center's address, telephone, and fax are: 222 Rosewood Drive, Danvers, MA 01923, (508)750-8400, and fax (508)750-4744.

The Association of American Publishers (AAP) has created a standardized form for college faculty to submit to a copy center or bookstore in order to request copyrighted material for course packs. The form is available through the CCC, which will handle copyright permissions. Authors of *APSR* articles may use their own articles in course packs or other printed materials without payment of royalty fees.

INDEXING

Articles and notes appearing in the *Review* before the June 1953 issue were indexed in *The Reader's Guide to Periodical Literature*. Current issues are indexed by *EconLit*, *International Political Science Abstracts*, *Social Sciences Index*, and *United States Political Science Documents*. Microfilm of the *Review*, beginning with Volume 1, may be obtained from University Microfilms, 300 North Zeeb Road, Ann Arbor, MI 48106. A *Cumulative Index of the Review*, Volumes 1-62, 1906-1968, also may be obtained from University Microfilms. Articles appearing in the *Review* are listed in *ABC Pol Sci* and *Current Contents: Behavioral, Social and Management Sciences*. Book Reviews are indexed in *Book Review Index*.

Editor's Notes

Authors are alerted that the Instructions to Contributors have been expanded and contain more information about the *American Political Science Review's* policies on avoidance of duplicate or overlapping manuscripts, preparation of anonymous copies of manuscripts for review purposes, and other matters. Authors are also reminded that the *APSR* will not accept new manuscripts during August 1998. The summer moratorium on new manuscripts does not include invited revisions and reviews, which may be submitted at any time.

Book authors and publishers should note that the address for the Book Review Editor is changing as of July 1, 1998. Please see page x for further information.

INSTRUCTIONS TO CONTRIBUTORS

General Considerations

The *American Political Science Review* strives to publish scholarly research of exceptional merit, demonstrating the highest standards of excellence in conceptualization, exposition, methodology, and craftsmanship. Because the *Review* reaches a diverse audience of scholars and practitioners, contributors should demonstrate how their analysis illuminates a significant research problem, or answers an important research question, of general interest in political science. For the same reason, authors should strive for a presentation that will be understandable to as many scholars as possible, consistent with the nature of their material.

Authors should not submit articles that contain tables, figures, or substantial amounts of text that have already been published in other places, are forthcoming, or are included in other manuscripts submitted for review, whether books or periodicals. In many such cases, subsequent publication of this material would violate the copyright of the other publisher. *Moreover, the APSR does not consider papers currently under review at other journals or that duplicate or overlap with parts of larger manuscripts that have been submitted to other publishers (including publishers of both books and periodicals).* Since space is at a premium, submission of articles substantially similar to manuscripts submitted or published elsewhere, or to part of a book or other larger work, is also strongly discouraged. In general, these are self-policing norms. If there is any doubt about whether the policy would apply, it is the author's responsibility to discuss any such related publications in a cover letter to the Editor. The Editor should also be notified of any submissions to other publishers, whether for book or periodical publication, that occur while an article is under review at the *APSR* and that would fall within the scope of this policy. Copies of related publications may be requested.

For manuscripts containing quantitative evidence and analysis, authors should describe their empirical procedures in sufficient detail to permit reviewers to

understand and evaluate what has been done and, in the event the article is accepted for publication, to permit other scholars to carry out similar analyses on other data sets. For example, for surveys, at the least, sampling procedures, response rates, and question wordings should be given; for experiments, full descriptions of experimental protocols should be provided. It is desirable for articles to be self-contained, and authors should not refer readers to other publications for descriptions of these basic research procedures.

Please indicate variables included in empirical analyses by capitalizing the first word in the variable name and italicizing the entire variable name the *first* time each is mentioned in the text. Authors should also be consistent in using the same names for variables in text and tables, and avoid overuse of acronyms and computer abbreviations when discussing variables in the text. All variables appearing in tables should have been mentioned in the text and the reason for their inclusion in the analysis discussed.

As part of the review process, authors may be asked to submit additional documentation if procedures are not sufficiently clear; the review process works most efficiently if such information is given in the initial submission. If readers are advised that additional information is available from the author, printed copies of that information should be submitted with the manuscript. If the amount of this supplementary information is extensive, please inquire about alternate procedures.

The *APSR* uses a double-blind review process. Authors should follow the guidelines for preparing anonymous copies in the "Specific Procedures" section below.

Manuscripts that are largely or entirely critiques or commentaries on previously published articles will be reviewed using the same general procedures as for regular articles with one exception. In addition to the usual number of reviewers, such manuscripts will also be sent to the scholar(s) whose work is being critiqued, in the same anonymous form as they are sent to other reviewers. Comments from the original author(s) to the editor will be invited as a supplement to the advice of regular reviewers. There are several purposes for this notice to the original author(s): (1) to encourage review of the details of analyses or research procedures that might occasionally escape the notice of disinterested reviewers; (2) to enable prompt publication of critiques by supplying critiqued authors with early notice of their existence and, therefore, more adequate time to reply; (3) as a courtesy to critiqued authors. Authors of critiques should therefore send as many additional copies of their manuscripts as will be required for this purpose.

Manuscripts being submitted for publication should be sent to Professor Ada W. Finifter, Editor, *American Political Science Review*, Department of Political Science, Michigan State University, 303 South

Kedzie Hall, East Lansing, MI 48824-1032. Correspondence concerning manuscripts under review may be sent to the same address or, preferably, by e-mail to apsr@ssc.msu.edu. Please note that the *APSR* will not process new manuscripts during August 1998. New manuscripts should be mailed to arrive either before or after this period. Invited revisions and reviews may be submitted at any time and will be processed upon arrival.

Manuscript Formatting

Manuscripts must not be longer than 45 pages including text, all tables and figures, notes, references, and appendices. The page size guideline is based on the U.S. standard 8.5 X 11 inch paper and must be adjusted accordingly by authors who are submitting manuscripts printed on longer paper. Font size must be at least 11 point for all parts of the paper. The entire paper must be double-spaced, with the sole exception of tables for which double-spacing would require a second page otherwise not needed. All pages should be numbered in one sequence, and text should be formatted using a normal single column no wider than 6½ inches, as is typical for manuscripts (rather than the double-column format of the published version of the *Review*), and printed on one side of the page only. Include an abstract of no more than 150 words. The *American Political Science Review* style of embedded citations should be used, and there must be a separate list of references at the end of the article. Please do not use footnotes for simple citations. These specifications are designed to make it easier for reviewers to read and evaluate papers. Papers not adhering to these guidelines are subject to being rejected without review.

For submission and review purposes, authors are encouraged to place footnotes at the bottom of the pages instead of using endnotes and may locate tables and figures (on separate pages and only one to a page) approximately where they fall in the text. However, manuscripts accepted for publication must be submitted with endnotes, and with tables and figures on separate pages at the back of the manuscript with standard indications of text placement, e.g., [Table 3 about here]. In deciding how to format your initial submission, please consider the necessity of making these changes if your paper is accepted. Authors of accepted manuscripts are also required to submit camera-ready copy of graphs or other types of figures. Instructions will be provided.

The *American Political Science Review* citation format requires inclusion of month, season, or issue number (in that order of preference if a cited journal provides more than one) as part of the volume and page identification. For example, a reference to an article in the *Review* would be given as 90(September): 475–87, rather than 90:475–87. On other questions of form, please follow the example of a recent issue of the *Review*. For unusual style or formatting issues, authors may refer to *The Chicago Manual of Style*, 14th edition.

Specific Procedures

Please follow these specific procedures for submission:

1. Submit five copies of manuscripts. Please review all pages of all copies to make sure all copies contain all tables, figures, appendices, and bibliography mentioned in the manuscript and that all pages are legible.
2. To comply with the *Review*'s policy of double-blind peer reviews, only one of the five copies submitted should be fully identified as to authorship and four should be in anonymous format.
3. For anonymous copies, if it is important to the development of the paper that an author's previous publications be cited, this should be done in a way that does not make the authorship of the submitted paper obvious. This is usually most easily accomplished by referring to oneself in the third person and including normal references to the work cited in the list of references. Under no circumstances should an author's prior publications be included in the bibliography in their normal alphabetical location but with the author's name deleted. Assuming that text references to an author's previous work are in third person, full citations should be included as usual in the bibliography. Use of other procedures to render manuscripts anonymous should be discussed with the Editor prior to submission. Authors also should not thank colleagues in notes or elsewhere in the body of the paper or mention institution names, web page addresses, or other potentially identifying information. All acknowledgements must appear on the title page of the identified copy only. Manuscripts that are not judged anonymous will not be reviewed.
4. Cover pages: The first page of the four anonymous copies should contain only the title and an abstract of no more than 150 words. The first page of the identified copy should contain (a) the name, academic rank, institutional affiliation, and contact information (address, telephone, fax, e-mail) for all authors; (b) in the case of multiple authors, an indication of the author who will receive correspondence; (c) any relevant citations to the author's previous work that have been omitted from the anonymous copies; (d) acknowledgements, including the names of any colleagues who have provided comments to the author on the manuscript. If the identified copy contains any unique references or is worded differently in any way, please mark this copy with "Contains author citations" at the top of the first page.
5. Please also send a loose copy of the cover page of the identified copy.
6. Authors having access to e-mail should send a copy of the abstract to apsr@ssc.msu.edu, when the submission is mailed. The subject line should contain the word *Abstract* followed by the first listed author's last name. The body of the message should contain the title of the paper, the names of all authors, and the abstract (as on the loose page described above). E-mail submission

of the abstract is not required but will help us process your manuscript more efficiently.

7. Authors should not fax abstracts, send any part of the paper itself by e-mail, or send the abstract by e-mail before their submission packet is in the mail.

No copies of submitted manuscripts can be returned.

Since submission procedures may be modified in the future, authors are encouraged to check for current instructions in the most recent issue of the *Review* or at our Internet web site, <http://www.ssc.msu.edu/~apsr/>.

ONLINE ACCESS TO THE AMERICAN POLITICAL SCIENCE REVIEW

Except for the last three years (as an annually "moving wall"), back issues of the *American Political Science Review* beginning with Volume 1, Number 1 (November 1906) are available online through JSTOR (<http://www.jstor.org/>). Issues through Volume 88, Number 4 (December 1994) are currently available. *JSTOR* is available by library subscription.

Current issues of the *Review* are also available online by library subscription, from a number of database vendors. At present, these include University Microfilms Inc. (UMI), Online Computer Library Center (OCLC), and the Information Access Company (IAC), but there may be others as well. UMI (through its products General Periodicals Online, Social Science Index, and ProQuest Direct), OCLC (through its product First Search), and IAC (through its products Expanded Academic Index and InfoTrac) provide full text access to both the *APSR* and *PS*.

The editorial office of the APSR is not involved in the subscription process to either JSTOR for back issues or the other vendors for current issues. Please contact your reference librarian for further information about availability.

BOOK REVIEWS

Please note that the location of the Book Review office is changing. The information that follows is effective as of July 1, 1998.

All book review correspondence should be sent to the Book Review Editor, Professor Mark Lichbach, *American Political Science Review* Book Review, Department of Political Science, University of California, Riverside, Riverside, CA 92521-0118. Authors wishing their book to be considered for review should ask their publisher to send a copy to the Book Review Editor. Those interested in reviewing books should send their vita to the Book Review Editor.

OTHER CORRESPONDENCE

The American Political Science Association's address, telephone and fax are: 1527 New Hampshire Avenue, NW, Washington, D.C. 20036, (202)483-2512, and fax (202)483-2657. E-mail: apsa@apsanet.org. Please direct correspondence as follows:

EXPEDITING REQUESTS FOR COPYING APSR AND PS ARTICLES FOR CLASS USE

The APSA already has an agreement with the Copyright Clearance Center (CCC) whereby bookstores and copy centers can receive expedited clearance to copy articles from the *APSR* and *PS* in compliance with the Association's policies and applicable fees. In regard to these permission fees, there is no charge for the first ten copies of an article. Any additional copies are 75 cents each. The Copyright Clearance Center's address, telephone, and fax are: 222 Rosewood Drive, Danvers, MA 01923, (508)750-8400, and fax (508)750-4744.

The Association of American Publishers (AAP) has created a standardized form for college faculty to submit to a copy center or bookstore in order to request copyrighted material for course packs. The form is available through the CCC, which will handle copyright permissions. Authors of *APSR* articles may use their own articles in course packs or other printed materials without payment of royalty fees.

INDEXING

Articles appearing in the *Review* before June 1953 were indexed in *The Reader's Guide to Periodical Literature*. Current issues are indexed in *ABC Pol Sci; America, History and Life 1954-; Book Review Index; Current Contents: Social and Behavioral Sciences; EconLit; Energy Information Abstracts; Environmental Abstracts; Historical Abstracts; Index of Economic Articles; Information Service Bulletin; International Index; International Political Science Abstracts; The Journal of Economic Literature; Periodical Abstracts; Public Affairs; Recently Published Articles; Reference Sources; Social Sciences and Humanities Index; Social Sciences Index; Social Work Research and Abstracts; and Writings on American History*. Some of these sources may be available in electronic form through local public or educational libraries. Microfilm of the *Review*, beginning with Volume 1, and the index of the *Review* through 1969 are available through University Microfilms Inc., 300 North Zeeb Road, Ann Arbor, MI 48106 (www.umi.com). *The Cumulative Index to the American Political Science Review, Volumes 63 to 89: 1969-95* is available through the American Political Science Association.

Editor's Notes

The relationship between electronic publication and traditional print journals such as the *American Political Science Review* is a matter of increasing discussion in both scholarly and editorial communities. The outcome of many issues will emerge only over time from the interplay of the interests of scholars, libraries, and publishers. For example, will print journals become merely archives for scholarly work rather than important vehicles in its development? "Never!" seems not to take account of the incredibly rapid growth of internet publication and the efficient way it responds to scholars' needs to communicate with one another and keep abreast of the latest advances. "Yes" to an archival role for print journals seems plausible until one contemplates the space limitations of most libraries and the financial pressures that have caused many to discontinue subscriptions to journals they deem of lesser importance to their constituents. But a response of "not even that" seems premature given that many resources and postings on the web that one day appear as part of the scholarly record may be missing the next. Many of the apparently most stable of the electronic resources are, at least at present, actually based on print journals, or are institution-sponsored compilations of conference papers or other "unpublished" works, or are designed as efficient ways to distribute materials by authors who are also pursuing traditional print publication. How long it will take for scholarly publications that are *only* electronic to achieve the authority, reliability, or permanence required to become a major or the primary part of the scholarly record remains to be seen.

Nevertheless, as an increasing number of scholarly works appear on the internet, editors of traditional print journals have been confronted with the question of whether these works should also be considered for journal publication. There is much to be said on both sides. On the one hand, the author of an article posted on the internet may not consider the work final; rather s/he may be seeking comments from colleagues precisely in the hope that these informal "reviews" will strengthen the product submitted to a print (or perhaps even electronic) journal. While editors of major journals generally hope to be "first with the news," they rightly should feel uncomfortable about discouraging this type of scholarly communication and the submission of more polished work. A strong case also can be made that in many cases posting an article or making it available in an electronic archive is merely an extension of the scholarly convention of distributing "working drafts" and is a more efficient substitute for postal distribution. Electronic posting also disseminates ideas quickly, and the subsequent rapid scholarly interaction can have synergistic effects on the advance of scholarship.

On the other hand, all scholars are faced with a glut of information and published work. Some have argued that devoting attention to electronic papers, which may

be revised after posting, are impermanent, and—most important—are not subjected to the peer review process, leads to a collective loss of efficiency. Even more seriously, the rapid dissemination of wrong or misleading ideas can dissipate scientific energy. Some editors, particularly in the biomedical and health sciences, have argued that it is ethically and morally irresponsible for researchers to post papers that have not been vetted by peer review because they may spread invalid or inaccurate ideas or conclusions that may cause public harm or confusion (and are more likely to do so than those that have been vetted). Those who regard posting research papers that have not been peer reviewed as a violation of scientific norms argue that refusing to consider materials that have been posted electronically is an effective way to discourage this practice. Other editors are so concerned with the value of originality in their journal that ideas already "published" electronically are not considered acceptable submissions. Yet, this may have a chilling effect on scientific collaboration, and on the very ideas that generate the most interest and debate, and ultimately the journal is deprived of the opportunity to publish important work. Some editors have retreated from an extreme position on this issue. Still, many journals operate under severe space and financial constraints; faced with a choice between using reviewer resources and space for work already largely known to the relevant scientific public, or for work not widely disseminated, they opt for the latter. (The issue is similar to duplicate and overlapping publication in journals and books, or in journal articles that differ only marginally.)

For journals that emphasize "original work," the question may revolve around the meaning of *published*. Unfortunately, *Roget's Thesaurus of English Words and Phrases* (Longman's electronic version on CD, of course) is not much help. One class of root ideas refers to works "in circulation," "making the rounds," "in the headlines," "public," "known," "open," "distributed," "circularized," "disseminated," "broadcast," "ventilated," and "on the air" (my 1995 version of the publication does not include "on the net," but clearly that would fall within this meaning). Another underlying idea is "in print," or "printed," and such associated terms as "cold type," "hot metal set," "composed," "machined, etc." One wonders whether digital type can be described as "cold" or "hot," but surely many elegantly presented web documents are "composed," and all of them may be considered "machined." Moreover, since someone who passes a bad check can be charged with "uttering and publishing," definitional analysis may not be an efficient path to the heart of the matter.

What does seem clear is that some types of electronic availability are more akin to scholarly publishing than others. One important criterion is whether a work has been peer reviewed or subject to some other form of careful editorial selection. To the extent that this is

the case, the material can be similar in quality and authority to that appearing in traditional journals. To review such articles again for print publication would deny the electronic forum the very legitimacy it seeks. Electronic journals are currently struggling for legitimacy and authority in many disciplines. Within a decade that may be achieved, but for it to occur, they must be seen as simply a different publication mode, not a way station until a traditional print berth can be secured. In contrast, papers submitted to an electronic archive and made available without any selection process are more akin to conventional working papers. Even here, however, the modes of storage and distribution of electronic archives are similar in some respects to those of "on-demand" print publishers, although the latter more clearly choose what they will distribute.

A second simple criterion of "publication" is whether an author has transferred copyright to the host of the electronic site. If so, then to argue that the paper is not really "published" is to say that the copyright is invalid and the electronic site is not really part of the scholarly publication apparatus.

For all these reasons, online journals and other internet sites that have similar characteristics are properly defined as alternate publication modes and should be considered as such by authors in determining whether a potential submission to *APSR* has already been submitted or published, in whole or in part, in another journal or publication site. Undoubtedly, there will be cases in which it is difficult to decide whether a work posted to the internet is "published." A reasonable rule of thumb is to consider work published if it appears on electronic sites described as journals, run by traditional publishers, claiming peer review or other forms of filtering or editorial selection, and/or assuming copyright. At present, papers archived at electronic sites that have none of these characteristics are considered "unpublished" for purposes of *APSR* submission.

INSTRUCTIONS TO CONTRIBUTORS

General Considerations

The *American Political Science Review* strives to publish scholarly research of exceptional merit, demonstrating the highest standards of excellence in conceptualization, exposition, methodology, and craftsmanship. Because the *Review* reaches a diverse audience of scholars and practitioners, contributors should demonstrate how their analysis illuminates a significant research problem, or answers an important research question, of general interest in political science. For the same reason, authors should strive for a presentation that will be understandable to as many scholars as possible, consistent with the nature of their material.

Since the *Review* publishes original research, authors should not submit articles containing tables, figures, or substantial amounts of text already published or forthcoming in other places, or that are included in other manuscripts submitted for review, whether to book publishers or periodicals (including online journals), or

are otherwise committed. In many such cases, subsequent publication of this material would violate the copyright of the other publisher. The *APSR* also does not consider papers currently under review at other journals or that duplicate or overlap with parts of larger manuscripts that have been submitted to other publishers (including publishers of both books and periodicals). Since space is at a premium, submission of articles substantially similar to manuscripts submitted or published elsewhere, or to part of a book or other larger work, is also strongly discouraged. If there is any doubt about whether these policies would apply to a particular case, the author should discuss any such publications related to a submission in a cover letter to the Editor. The Editor should also be notified of any related submissions to other publishers, whether for book or periodical publication, that occur while an article is under review at the *APSR* and that would fall within the scope of this policy. Copies of related publications may be requested.

For manuscripts containing quantitative evidence and analysis, authors should describe their empirical procedures in sufficient detail to permit reviewers to understand and evaluate what has been done and, in the event the article is accepted for publication, to permit other scholars to carry out similar analyses on other data sets. For example, for surveys, at the least, sampling procedures, response rates, and question wordings should be given; for experiments, full descriptions of experimental protocols should be provided. It is desirable for articles to be self-contained, and authors should not refer readers to other publications for descriptions of these basic research procedures.

Please indicate variables included in empirical analyses by capitalizing the first word in the variable name and italicizing the entire variable name the *first* time each is mentioned in the text. Authors should also be consistent in using the same names for variables in text and tables, and avoid overuse of acronyms and computer abbreviations when discussing variables in the text. All variables appearing in tables should have been mentioned in the text and the reason for their inclusion in the analysis discussed.

As part of the review process, authors may be asked to submit additional documentation if procedures are not sufficiently clear; the review process works most efficiently if such information is given in the initial submission. If readers are advised that additional information is available from the author, printed copies of that information should be submitted with the manuscript. If the amount of this supplementary information is extensive, please inquire about alternate procedures.

The *APSR* uses a double-blind review process. Authors should follow the guidelines for preparing anonymous copies in the "Specific Procedures" section below.

Manuscripts that are largely or entirely critiques or commentaries on previously published articles will be reviewed using the same general procedures as for regular articles with one exception. In addition to the usual number of reviewers, such manuscripts will also

be sent to the scholar(s) whose work is being critiqued, in the same anonymous form as they are sent to other reviewers. Comments from the original author(s) to the editor will be invited as a supplement to the advice of regular reviewers. There are several purposes for this notice to the original author(s): (1) to encourage review of the details of analyses or research procedures that might occasionally escape the notice of disinterested reviewers; (2) to enable prompt publication of critiques by supplying critiqued authors with early notice of their existence and, therefore, more adequate time to reply; (3) as a courtesy to critiqued authors. Authors of critiques should therefore send as many additional copies of their manuscripts as will be required for this purpose.

Manuscripts being submitted for publication should be sent to Professor Ada W. Finifter, Editor, *American Political Science Review*, Department of Political Science, Michigan State University, 303 South Kedzie Hall, East Lansing, MI 48824-1032. Correspondence concerning manuscripts under review may be sent to the same address or, preferably, by e-mail to apsr@ssc.msu.edu. Please note that the *APSR* will not process new manuscripts during August 1998. New manuscripts should be mailed to arrive either before or after this period. Invited revisions and reviews may be submitted at any time and will be processed upon arrival.

Manuscript Formatting

Manuscripts must not be longer than 45 pages including text, all tables and figures, notes, references, and appendices. The page size guideline is based on the U.S. standard 8.5 X 11 inch paper and must be adjusted accordingly by authors who are submitting manuscripts printed on longer paper. Font size must be at least 11 point for all parts of the paper. The entire paper must be double-spaced, with the sole exception of tables for which double-spacing would require a second page otherwise not needed. All pages should be numbered in one sequence, and text should be formatted using a normal single column no wider than 6½ inches, as is typical for manuscripts (rather than the double-column format of the published version of the *Review*), and printed, on one side of the page only. Include an abstract of no more than 150 words. The *American Political Science Review* style of embedded citations should be used, and there must be a separate list of references at the end of the article. Please do not use footnotes for simple citations. These specifications are designed to make it easier for reviewers to read and evaluate papers. Papers not adhering to these guidelines are subject to being rejected without review.

For submission and review purposes, authors are encouraged to place footnotes at the bottom of the pages instead of using endnotes and may locate tables and figures (on separate pages and only one to a page) approximately where they fall in the text. However, manuscripts accepted for publication must be submitted with endnotes, and with tables and figures on separate pages at the back of the manuscript with

standard indications of text placement, e.g., [Table 3 about here]. In deciding how to format your initial submission, please consider the necessity of making these changes if your paper is accepted. Authors of accepted manuscripts are also required to submit camera-ready copy of graphs or other types of figures. Instructions will be provided.

The *American Political Science Review* citation format requires inclusion of month, season, or issue number (in that order of preference if a cited journal provides more than one) as part of the volume and page identification. For example, a reference to an article in the *Review* would be given as 90(September): 475–87, rather than 90:475–87. On other questions of form, please follow the example of a recent issue of the *Review*. For unusual style or formatting issues, authors may refer to *The Chicago Manual of Style*, 14th edition.

Specific Procedures

Please follow these specific procedures for submission:

1. Submit five copies of manuscripts. Please review all pages of all copies to make sure all copies contain all tables, figures, appendices, and bibliography mentioned in the manuscript and that all pages are legible.
2. To comply with the *Review's* policy of double-blind peer reviews, only one of the five copies submitted should be fully identified as to authorship and four should be in anonymous format.
3. For anonymous copies, if it is important to the development of the paper that an author's previous publications be cited, this should be done in a way that does not make the authorship of the submitted paper obvious. This is usually most easily accomplished by referring to oneself in the third person and including normal references to the work cited in the list of references. Under no circumstances should an author's prior publications be included in the bibliography in their normal alphabetical location but with the author's name deleted. Assuming that text references to an author's previous work are in third person, full citations should be included as usual in the bibliography. Use of other procedures to render manuscripts anonymous should be discussed with the Editor prior to submission. Authors also should not thank colleagues in notes or elsewhere in the body of the paper or mention institution names, web page addresses, or other potentially identifying information. All acknowledgements must appear on the title page of the identified copy only. Manuscripts that are not judged anonymous will not be reviewed.
4. Cover pages: The first page of the four anonymous copies should contain only the title and an abstract of no more than 150 words. The first page of the identified copy should contain (a) the name, academic rank, institutional affiliation, and contact information (address, telephone, fax, e-mail) for all authors; (b) in the case of multiple authors, an indication of the author who will receive correspondence; (c) any relevant citations

to the author's previous work that have been omitted from the anonymous copies; (d) acknowledgements, including the names of any colleagues who have provided comments to the author on the manuscript. If the identified copy contains any unique references or is worded differently in any way, please mark this copy with "Contains author citations" at the top of the first page.

5. Please also send a loose copy of the cover page of the identified copy.
6. Authors having access to e-mail should send a copy of the abstract to apsr@ssc.msu.edu, when the submission is mailed. The subject line should contain the word *Abstract* followed by the first listed author's last name. The body of the message should contain the title of the paper, the names of all authors, and the abstract (as on the loose page described above). E-mail submission of the abstract is not required but will help us process your manuscript more efficiently.
7. Authors should not fax abstracts, send any part of the paper itself by e-mail, or send the abstract by e-mail before their submission packet is in the mail.

No copies of submitted manuscripts can be returned.

Since submission procedures may be modified in the future, authors are encouraged to check for current instructions in the most recent issue of the *Review* or at our Internet web site, <http://www.ssc.msu.edu/~apsr/>.

ONLINE ACCESS TO THE AMERICAN POLITICAL SCIENCE REVIEW

Except for the last three years (as an annually "moving wall"), back issues of the *American Political Science Review* beginning with Volume 1, Number 1 (November 1906) are available online through JSTOR (<http://www.jstor.org/>). Issues through Volume 88, Number 4 (December 1994) are currently available. *JSTOR is available by library subscription.*

Current issues of the *Review* are also available online by library subscription, from a number of database vendors. At present, these include University Microfilms Inc. (UMI), Online Computer Library Center (OCLC), and the Information Access Company (IAC), but there may be others as well. UMI (through its products General Periodicals Online, Social Science Index, and ProQuest Direct), OCLC (through its product First Search), and IAC (through its products Expanded Academic Index and InfoTrac) provide full text access to both the *APSR* and *PS*.

The editorial office of the APSR is not involved in the subscription process to either JSTOR for back issues or the other vendors for current issues. Please contact your reference librarian for further information about availability.

BOOK REVIEWS

Please note that the location of the Book Review office has changed.

All book review correspondence should be sent to the Book Review Editor, Professor Mark Lichbach, *American Political Science Review* Book Review, Department of Political Science, University of California,

Riverside, Riverside, CA 92521-0118. E-mail: apsrbook@wizard.ucr.edu. Authors wishing their book to be considered for review should ask their publisher to send a copy to the Book Review Editor. Those interested in reviewing books should send their vita to the Book Review Editor.

OTHER CORRESPONDENCE

The American Political Science Association's address, telephone and fax are: 1527 New Hampshire Avenue, NW, Washington, D.C. 20036, (202)483-2512, and fax (202)483-2657. E-mail: apsa@apsanet.org. Please direct correspondence as follows:

Information, including news and notes, for *PS*

Dr. Robert J-P. Hauck, Editor, *PS*

E-mail: rhauck@apsanet.org

Circulation and subscription correspondence (domestic claims for nonreceipt of issues must be made within four months of the month of publication; overseas claims, eight months)

E-mail: elamb@apsanet.org

Advertising information and rates

Laura Barrantes, Advertising Manager

E-mail: lbarrantes@apsanet.org

EXPEDITING REQUESTS FOR COPYING APSR AND PS ARTICLES FOR CLASS USE

The APSA already has an agreement with the Copyright Clearance Center (CCC) whereby bookstores and copy centers can receive expedited clearance to copy articles from the *APSR* and *PS* in compliance with the Association's policies and applicable fees. In regard to these permission fees, there is no charge for the first ten copies of an article. Any additional copies are 75 cents each. The Copyright Clearance Center's address, telephone, and fax are: 222 Rosewood Drive, Danvers, MA 01923, (508)750-8400, and fax (508)750-4744.

The Association of American Publishers (AAP) has created a standardized form for college faculty to submit to a copy center or bookstore in order to request copyrighted material for course packs. The form is available through the CCC, which will handle copyright permissions. Authors of *APSR* articles may use their own articles in course packs or other printed materials without payment of royalty fees.

INDEXING

Articles appearing in the *Review* before June 1953 were indexed in *The Reader's Guide to Periodical Literature*. Current issues are indexed in *ABC Pol Sci*; *America*, *History and Life* 1954-; *Book Review Index*; *Current Contents: Social and Behavioral Sciences*; *EconLit*;

Energy Information Abstracts; Environmental Abstracts; Historical Abstracts; Index of Economic Articles; Information Service Bulletin; International Index; International Political Science Abstracts; The Journal of Economic Literature; Periodical Abstracts; Public Affairs; Recently Published Articles; Reference Sources; Social Sciences and Humanities Index; Social Sciences Index; Social Work Research and Abstracts; and Writings on American History. Some of these sources may be

available in electronic form through local public or educational libraries. Microfilm of the *Review*, beginning with Volume 1, and the index of the *Review* through 1969 are available through University Microfilms Inc., 300 North Zeeb Road, Ann Arbor, MI 48106 (www.umi.com). *The Cumulative Index to the American Political Science Review, Volumes 63 to 89: 1969-95* is available through the American Political Science Association.

Editor's Notes

This is the last number of Volume 92 and the index for this volume can be found at the back of the issue. This issue also marks the end of my first term as Editor of the *Review*. I thank all those who have made the last three years so stimulating and challenging, and who have helped to produce the high quality research and book reviews contained in these three volumes: authors, manuscript reviewers, Editorial Board, *APSR* interns and editorial office staff at Michigan State University, book reviewers, the Book Review Editor and his assistants at both the University of Colorado and the University of California-Riverside, and the three institutions involved for their generous support of this scholarly enterprise.

The *APSR* has an interesting editorial structure. In some ways it is very centralized: There is one Editor who is responsible for all aspects of the *Review* and all editorial decisions. At the same time, it is very decentralized: The Editor's decisions are based largely on the advice of a very diverse and far-flung set of reviewers, chosen specifically for their expertise on the subject of each manuscript that is reviewed. The Editorial Board connects the Editor to this large set of reviewers by using its extensive knowledge of the discipline to recommend appropriate reviewers for each manuscript.

As I have done for the previous two years, I am happy to include at the back of this issue the list of manuscript reviewers who assisted in the peer review process during 1997–98. Almost 900 different scholars participated this year, and nearly 1,600 have participated over the last three years, during which we reviewed more than 1,500 manuscripts submitted for publication. This list is the only public recognition most of these individuals receive for their valuable services, but their behind-the-scenes work makes an enormous contribution to the quality of articles that appear in the *Review*.

Thank you all for your contributions to the *APSR*.

The next three years will undoubtedly witness increasing change in scholarly publishing, already in a state of great ferment over issues of electronic publication, library availability, online access, scholar and university rights in publication, and copyright protection. Much of this is, of course, driven by the rapid growth of the Internet. We continue to use the web in ways that we hope are helpful and appropriate for a print journal. For advance news of articles accepted for publication and tables of contents, abstracts, and lists of tables and figures for all articles published in the *Review* in the last three years, visit our web site at <http://www.ssc.msu.edu/~apsr/>. Information for each issue is posted approximately one month before the printed issue is mailed, and articles accepted for publication are added to the forthcoming list on a regular basis. The index for Volume 92, 1998, is also available there.

INSTRUCTIONS TO CONTRIBUTORS

General Considerations

The *American Political Science Review* strives to publish scholarly research of exceptional merit, demonstrating the highest standards of excellence in conceptualization, exposition, methodology, and craftsmanship. Because the *Review* reaches a diverse audience of scholars and practitioners, contributors should demonstrate how their analysis illuminates a significant research problem, or answers an important research question, of general interest in political science. For the same reason, authors should strive for a presentation that will be understandable to as many scholars as possible, consistent with the nature of their material.

Since the *Review* publishes original research, authors should not submit articles containing tables, figures, or substantial amounts of text already published or forthcoming in other places, or that are included in other manuscripts submitted for review, whether to book publishers or periodicals (including online journals), or are otherwise committed. In many such cases, subsequent publication of this material would violate the copyright of the other publisher. The *APSR* also does not consider papers currently under review at other journals or that duplicate or overlap with parts of larger manuscripts that have been submitted to other publishers (including publishers of both books and periodicals). Since space is at a premium, submission of articles substantially similar to manuscripts submitted or published elsewhere, or to part of a book or other larger work, is also strongly discouraged. If there is any doubt about whether these policies would apply to a particular case, the author should discuss any such publications related to a submission in a cover letter to the Editor. The Editor should also be notified of any related submissions to other publishers, whether for book or periodical publication, that occur while an article is under review at the *APSR* and that would fall within the scope of this policy. Copies of related publications may be requested.

For manuscripts containing quantitative evidence and analysis, authors should describe their empirical procedures in sufficient detail to permit reviewers to understand and evaluate what has been done and, in the event the article is accepted for publication, to permit other scholars to carry out similar analyses on other data sets. For example, for surveys, at the least, sampling procedures, response rates, and question wordings should be given; for experiments, full descriptions of experimental protocols should be provided. It is desirable for articles to be self-contained, and authors should not refer readers to other publications for descriptions of these basic research procedures.

Please indicate variables included in empirical analyses by capitalizing the first word in the variable name and italicizing the entire variable name the *first* time

each is mentioned in the text. Authors should also be consistent in using the same names for variables in text and tables, and avoid overuse of acronyms and computer abbreviations when discussing variables in the text. All variables appearing in tables should have been mentioned in the text and the reason for their inclusion in the analysis discussed.

As part of the review process, authors may be asked to submit additional documentation if procedures are not sufficiently clear; the review process works most efficiently if such information is given in the initial submission. If readers are advised that additional information is available from the author, printed copies of that information should be submitted with the manuscript. If the amount of this supplementary information is extensive, please inquire about alternate procedures.

The *APSR* uses a double-blind review process. Authors should follow the guidelines for preparing anonymous copies in the "Specific Procedures" section below.

Manuscripts that are largely or entirely critiques or commentaries on previously published articles will be reviewed using the same general procedures as for regular articles with one exception. In addition to the usual number of reviewers, such manuscripts will also be sent to the scholar(s) whose work is being critiqued, in the same anonymous form as they are sent to other reviewers. Comments from the original author(s) to the editor will be invited as a supplement to the advice of regular reviewers. There are several purposes for this notice to the original author(s): (1) to encourage review of the details of analyses or research procedures that might occasionally escape the notice of disinterested reviewers; (2) to enable prompt publication of critiques by supplying critiqued authors with early notice of their existence and, therefore, more adequate time to reply; (3) as a courtesy to critiqued authors. Authors of critiques should therefore send as many additional copies of their manuscripts as will be required for this purpose.

Manuscripts being submitted for publication should be sent to Professor Ada W. Finifter, Editor, *American Political Science Review*, Department of Political Science, Michigan State University, 303 South Kedzie Hall, East Lansing, MI 48824-1032. Correspondence concerning manuscripts under review may be sent to the same address or, preferably, by e-mail to apsr@ssc.msu.edu. Please note that the *APSR* will not process new manuscripts during August 1998. New manuscripts should be mailed to arrive either before or after this period. Invited revisions and reviews may be submitted at any time and will be processed upon arrival.

Manuscript Formatting

Manuscripts must not be longer than 45 pages including text, all tables and figures, notes, references, and appendices. The page size guideline is based on the U.S. standard 8.5 X 11 inch paper and must be adjusted accordingly by authors who are submitting manuscripts

printed on longer paper. Font size must be at least 11 point for all parts of the paper. The entire paper must be double-spaced, with the sole exception of tables for which double-spacing would require a second page otherwise not needed. All pages should be numbered in one sequence, and text should be formatted using a normal single column no wider than 6½ inches, as is typical for manuscripts (rather than the double-column format of the published version of the *Review*), and printed on one side of the page only. Include an abstract of no more than 150 words. The *American Political Science Review* style of embedded citations should be used, and there must be a separate list of references at the end of the article. Please do not use footnotes for simple citations. These specifications are designed to make it easier for reviewers to read and evaluate papers. Papers not adhering to these guidelines are subject to being rejected without review.

For submission and review purposes, authors are encouraged to place footnotes at the bottom of the pages instead of using endnotes and may locate tables and figures (on separate pages and only one to a page) approximately where they fall in the text. However, manuscripts accepted for publication must be submitted with endnotes, and with tables and figures on separate pages at the back of the manuscript with standard indications of text placement, e.g., [Table 3 about here]. In deciding how to format your initial submission, please consider the necessity of making these changes if your paper is accepted. Authors of accepted manuscripts are also required to submit camera-ready copy of graphs or other types of figures. Instructions will be provided.

The *American Political Science Review* citation format requires inclusion of month, season, or issue number (in that order of preference if a cited journal provides more than one) as part of the volume and page identification. For example, a reference to an article in the *Review* would be given as 90(September): 475–87, rather than 90:475–87. On other questions of form, please follow the example of a recent issue of the *Review*. For unusual style or formatting issues, authors may refer to *The Chicago Manual of Style*, 14th edition.

Specific Procedures

Please follow these specific procedures for submission:

1. Submit five copies of manuscripts. Please review all pages of all copies to make sure all copies contain all tables, figures, appendices, and bibliography mentioned in the manuscript and that all pages are legible.
2. To comply with the *Review*'s policy of double-blind peer reviews, only one of the five copies submitted should be fully identified as to authorship and four should be in anonymous format.
3. For anonymous copies, if it is important to the development of the paper that an author's previous publications be cited, this should be done in a way that does not make the authorship of the submitted paper obvious. This is usually most easily accomplished by referring to oneself in the third person and including normal references to

the work cited in the list of references. Under no circumstances should an author's prior publications be included in the bibliography in their normal alphabetical location but with the author's name deleted. Assuming that text references to an author's previous work are in third person, *full citations should be included as usual in the bibliography*. Use of other procedures to render manuscripts anonymous should be discussed with the Editor prior to submission. Authors also should not thank colleagues in notes or elsewhere in the body of the paper or mention institution names, web page addresses, or other potentially identifying information. *All acknowledgements must appear on the title page of the identified copy only*. Manuscripts that are not judged anonymous will not be reviewed.

4. Cover pages: The first page of the four anonymous copies should contain only the title and an abstract of no more than 150 words. The first page of the identified copy should contain (a) the name, academic rank, institutional affiliation, and contact information (address, telephone, fax, e-mail) for all authors; (b) in the case of multiple authors, an indication of the author who will receive correspondence; (c) any relevant citations to the author's previous work that have been omitted from the anonymous copies; (d) acknowledgements, including the names of any colleagues who have provided comments to the author on the manuscript. If the identified copy contains any unique references or is worded differently in any way, please mark this copy with "Contains author citations" at the top of the first page.
5. Please also send a loose copy of the cover page of the identified copy.
6. Authors having access to e-mail should send a copy of the abstract to apsr@ssc.msu.edu, when the submission is mailed. The subject line should contain the word *Abstract* followed by the first listed author's last name. The body of the message should contain the title of the paper, the names of all authors, and the abstract (as on the loose page described above). E-mail submission of the abstract is not required but will help us process your manuscript more efficiently.
7. Authors should not fax abstracts, send any part of the paper itself by e-mail, or send the abstract by e-mail before their submission packet is in the mail. No copies of submitted manuscripts can be returned.

Since submission procedures may be modified in the future, authors are encouraged to check for current instructions in the most recent issue of the *Review* or at our Internet web site, <http://www.ssc.msu.edu/~apsr/>.

ELECTRONIC ACCESS TO THE AMERICAN POLITICAL SCIENCE REVIEW

Full text of the *American Political Science Review* is available in several electronic formats and through several different vendors.

Except for the last three years (as an annually

"moving wall"), *back issues* of the *American Political Science Review* beginning with Volume 1, Number 1 (November 1906) are available online through JSTOR (<http://www.jstor.org/>). Issues through Volume 88, Number 4 (December 1994) are currently available. *At present, JSTOR is available only by library subscription*.

Full text access to *current* issues of both the *APSR* and *PS* is also available online by *library subscription* from a number of database vendors. Currently, these include University Microfilms Inc. (UMI) (via its CD-ROMs General Periodicals Online and Social Science Index, and the online database ProQuest Direct), Online Computer Library Center (OCLC) (through its online database First Search as well as on CD-ROMs and magnetic tape), and the Information Access Company (IAC) (through its products Expanded Academic Index, InfoTrac, and several online services [see below]). Others may be added from time to time.

APSR is also available on databases available through six online services: Datastar (Datastar), Business Library (Dow Jones), Cognito (IAC), Encarta Online Library (IAC), IAC Business (Dialog), and Newsearch (Dialog).

The editorial office of the APSR is not involved in the subscription process to either JSTOR for back issues or the other vendors for current issues. Please contact your reference librarian or the database vendor for further information about availability.

BOOK REVIEWS

Please note that the location of the Book Review office has changed.

All book review correspondence should be sent to the Book Review Editor, Professor Mark Lichbach, *American Political Science Review* Book Review, Department of Political Science, University of California, Riverside, Riverside, CA 92521-0118. E-mail: apsrbook@wizard.ucr.edu. Authors wishing their book to be considered for review should ask their publisher to send a copy to the Book Review Editor. Those interested in reviewing books should send their vita to the Book Review Editor.

OTHER CORRESPONDENCE

The American Political Science Association's address, telephone and fax are: 1527 New Hampshire Avenue, NW, Washington, D.C. 20036, (202)483-2512, and fax (202)483-2657. E-mail: apsa@apsanet.org. Please direct correspondence as follows:

**EXPEDITING REQUESTS FOR COPYING
APSR AND PS ARTICLES FOR CLASS USE
AND OTHER PURPOSES****Class Use**

The Comprehensive Publisher Photocopy Agreement between APSA and the Copyright Clearance Center (CCC) permits bookstores and copy centers to receive expedited clearance to copy articles from the *APSR* and *PS* in compliance with the Association's policies and applicable fees. There is no fee for the first ten copies of an article. Any additional copies are 75 cents each. The Copyright Clearance Center's address, telephone, and fax are: 222 Rosewood Drive, Danvers, MA 01923, (508)750-8400, and fax (508)750-4744. This agreement pertains only to the reproduction and distribution of APSA materials as hard copies (e.g., photocopies, microfilm, and microfiche).

The Association of American Publishers (AAP) has created a standardized form for college faculty to submit to a copy center or bookstore to request copyrighted material for course packs. The form is available through the CCC, which will handle copyright permissions.

APSA also has a separate agreement pertaining to CCC's Academic E-Reserve Service. This agreement allows electronic access for students and instructors of a designated class at a designated institution for a specified article or set of articles in electronic format. Access is by password for the duration of a class.

Please contact your librarian, CCC, or the APSA Reprints Department for further information.

APSR Authors

Authors of *APSR* articles may use their own articles in course packs or other printed materials without payment of royalty fees.

Other Uses of APSA-Copyrighted Materials

For any further copyright issues, please contact the APSA Reprints Department.

INDEXING

A Behavioral Approach to the Rational Choice Theory of Collective Action Presidential Address, American Political Science Association, 1997

ELINOR OSTROM *Indiana University*

Extensive empirical evidence and theoretical developments in multiple disciplines stimulate a need to expand the range of rational choice models to be used as a foundation for the study of social dilemmas and collective action. After an introduction to the problem of overcoming social dilemmas through collective action, the remainder of this article is divided into six sections. The first briefly reviews the theoretical predictions of currently accepted rational choice theory related to social dilemmas. The second section summarizes the challenges to the sole reliance on a complete model of rationality presented by extensive experimental research. In the third section, I discuss two major empirical findings that begin to show how individuals achieve results that are "better than rational" by building conditions where reciprocity, reputation, and trust can help to overcome the strong temptations of short-run self-interest. The fourth section raises the possibility of developing second-generation models of rationality, the fifth section develops an initial theoretical scenario, and the final section concludes by examining the implications of placing reciprocity, reputation, and trust at the core of an empirically tested, behavioral theory of collective action.

Let me start with a provocative statement. You would not be reading this article if it were not for some of our ancestors learning how to undertake collective action to solve social dilemmas. Successive generations have added to the stock of everyday knowledge about how to instill productive norms of behavior in their children and to craft rules to support collective action that produces public goods and avoids "tragedies of the commons."¹ What our ancestors and contemporaries have learned about engaging in collective action for mutual defense, child rearing, and survival is not, however, understood or explained by the extant theory of collective action.

Yet, the theory of collective action is *the* central subject of political science. It is the core of the justification for the state. Collective-action problems pervade international relations, face legislators when devising public budgets, permeate public bureaucracies, and are at the core of explanations of voting, interest group formation, and citizen control of governments in a democracy. If political scientists do not have an empirically grounded theory of collective action, then

we are hand-waving at our central questions. I am afraid that we do a lot of hand-waving.

The lessons of effective collective action are not simple—as is obvious from human history and the immense tragedies that humans have endured, as well as the successes we have realized. As global relationships become even more intricately intertwined and complex, however, our survival becomes more dependent on empirically grounded scientific understanding. We have not yet developed a *behavioral theory of collective action* based on models of the individual consistent with empirical evidence about how individuals make decisions in social-dilemma situations. A behavioral commitment to theory grounded in empirical inquiry is essential if we are to understand such basic questions as why face-to-face communication so consistently enhances cooperation in social dilemmas or how structural variables facilitate or impede effective collective action.

Social dilemmas occur whenever individuals in interdependent situations face choices in which the maximization of short-term self-interest yields outcomes leaving all participants worse off than feasible alternatives. In a public-good dilemma, for example, all those who would benefit from the provision of a public good—such as pollution control, radio broadcasts, or weather forecasting—find it costly to contribute and would prefer others to pay for the good instead. If everyone follows the equilibrium strategy, then the good is not provided or is underprovided. Yet, everyone would be better off if everyone were to contribute.

Social dilemmas are found in all aspects of life, leading to momentous decisions affecting war and peace as well as the mundane relationships of keeping promises in everyday life. Social dilemmas are called by many names, including the public-good or collective-good problem (Olson 1965, P. Samuelson 1954), shirking (Alchian and Demsetz 1972), the free-rider problem (Edney 1979, Grossman and Hart 1980), moral hazard (Holmstrom 1982), the credible commitment dilemma (Williams, Collins, and Lichbach 1997), generalized social exchange (Ekeh 1974; Emerson 1972a,

Elinor Ostrom is Arthur F. Bentley Professor of Political Science; Co-Director, Workshop in Political Theory and Policy Analysis; and Co-Director, Center for the Study of Institutions, Population, and Environmental Change; Indiana University, Bloomington, IN 47408-3895.

The author gratefully acknowledges the support of the National Science Foundation (Grant #SBR-9319835 and SBR-9521918), the Ford Foundation, the Bradley Foundation, and the MacArthur Foundation. My heartiest thanks go to James Alt, Jose Apesteguia, Patrick Brandt, Kathryn Firmin-Sellers, Roy Gardner, Derek Kauneckis, Fabrice Lehoucq, Margaret Levi, Thomas Lyon, Tony Matejczyk, Mike McGinnis, Trudi Miller, John Orbell, Vincent Ostrom, Eric Rasmusen, David Schmidt, Sujai Shivakumar, Vernon Smith, Catherine Tucker, George Varughese, Jimmy Walker, John Williams, Rick Wilson, Toshio Yamagishi, and Xin Zhang for their comments on earlier drafts and to Patty Dalecki for all her excellent editorial and moral support.

¹ The term "tragedy of the commons" refers to the problem that common-pool resources, such as oceans, lakes, forests, irrigation systems, and grazing lands, can easily be overused or destroyed if property rights to these resources are not well defined (see Hardin 1968).

1972b; Yamagishi and Cook 1993), the tragedy of the commons (G. Hardin 1968), and exchanges of threats and violent confrontations (Boulding 1963). The prisoners' dilemma has become the best-known social dilemma in contemporary scholarship. Among the types of individuals who are posited to face these kinds of situations are politicians (Geddes 1994), international negotiators (Sandler 1992, Snidal 1985), legislators (Shepsle and Weingast 1984), managers (Miller 1992), workers (Leibenstein 1976), long-distance traders (Greif, Milgrom, and Weingast 1994), ministers (Bullock and Baden 1977), oligopolists (Cornes, Mason, and Sandler 1986), labor union organizers (Messick 1973), revolutionaries (Lichbach 1995), homeowners (Boudreaux and Holcombe 1989), even cheerleaders (Hardy and Latané 1988), and, of course, all of us—whenever we consider trusting others to cooperate with us on long-term joint endeavors.

In prehistoric times, simple survival was dependent both on the aggressive pursuit of self-interest and on collective action to achieve cooperation in defense, food acquisition, and child rearing. Reciprocity among close kin was used to solve social dilemmas, leading to a higher survival rate for those individuals who lived in families and used reciprocity within the family (Hamilton 1964). As human beings began to settle in communities and engage in agriculture and long-distance trade, forms of reciprocity with individuals other than close kin were essential to achieve mutual protection, to gain the benefits of long-distance trading, and to build common facilities and preserve common-pool resources.² Evolutionary psychologists have produced substantial evidence that human beings have evolved the capacity—similar to that of learning a language—to learn reciprocity norms and general social rules that enhance returns from collective action (Cosmides and Tooby 1992). At the same time, cognitive scientists have also shown that our genetic inheritance does not give us the capabilities to do unbiased, complex, and full analyses without substantial acquired knowledge and practice as well as reliable feedback from the relevant environment. Trial-and-error methods are used to learn individual skills as well as rules and procedures that increase the joint returns individuals may obtain through specialization, coordination, and exchange. All long-enduring political philosophies have recognized human nature to be complex mixtures of the pursuit of self-interest combined with the capability of acquiring internal norms of behavior and following enforced rules when understood and perceived to be legitimate. Our evolutionary heritage has hardwired us to be boundedly self-seeking at the same time that we are capable of learning heuristics and norms, such as reciprocity, that help achieve successful collective action.

One of the most powerful theories used in con-

temporary social sciences—rational choice theory—helps us understand humans as self-interested, short-term maximizers. Models of complete rationality have been highly successful in predicting marginal behavior in competitive situations in which selective pressures screen out those who do not maximize external values, such as profits in a competitive market or the probability of electoral success in party competition. Thin models of rational choice have been unsuccessful in explaining or predicting behavior in one-shot or finitely repeated social dilemmas in which the theoretical prediction is that no one will cooperate. In indefinitely (or infinitely) repeated social dilemmas, standard rational choice models predict a multitude of equilibria ranging from the very best to the very worst of available outcomes without any hypothesized process for how individuals might achieve more productive outcomes and avert disasters.³ Substantial evidence from experiments demonstrates that cooperation levels for most one-shot or finitely repeated social dilemmas far exceed the predicted levels and are systematically affected by variables that play no theoretical role in affecting outcomes. Field research also shows that individuals systematically engage in collective action to provide local public goods or manage common-pool resources without an external authority to offer inducements or impose sanctions. Simply assuming that individuals use long-range thinking “to achieve the goal of establishing and/or maintaining continued mutual cooperation” (Pruitt and Kimmel 1977, 375) is not a sufficient theory either. It does not explain why some groups fail to obtain joint outcomes easily available to them or why initial cooperation can break down.

We now have enough scholarship from multiple disciplines to expand the range of rational choice models we use. For at least five reasons, we need to formulate a behavioral theory of boundedly rational and moral behavior.

First, behavior in social dilemmas is affected by many structural variables, including size of group, heterogeneity of participants, their dependence on the benefits received, their discount rates, the type and predictability of transformation processes involved, the nesting of organizational levels, monitoring techniques, and the information available to participants.⁴ In theories that predict either zero or 100% cooperation in one-shot or finitely repeated dilemmas, structural variables do not affect levels of cooperation at all. A coherent explanation of the relationship among structural variables and the likelihood of individuals solving social dilemmas depends on developing a behavioral theory of rational choice. This will allow scholars who stress structural explanations of human behavior and those who stress individual choice to find common ground, rather than continue the futile debate over whether structural

² The term “reciprocal altruism” is used by biologists and evolutionary theorists to refer to strategies of conditional cooperation with *nonkin* that produce higher benefits for the individuals who follow these strategies if they interact primarily with others who are reciprocators (Trivers 1971). Since these strategies benefit the individual using them in the long term, I prefer the term “reciprocity.”

³ See Farrell and Maskin (1989) for a different approach to this problem.

⁴ This is only a short list of the more important variables found to affect behavior within social dilemmas (for summary overviews of this literature, see Goetze and Orbell 1988; Ledyard 1995; Lichbach 1996; E. Ostrom 1990, n.d.; E. Ostrom, Gardner, and Walker 1994; Sally 1995; Schroeder 1995).

variables or individual attributes are the most important.

Second, scholars in all the social and some biological sciences have active research programs focusing on how groups of individuals achieve collective action. An empirically supported theoretical framework for the analysis of social dilemmas would integrate and link their efforts. Essential to the development of such a framework is a conception of human behavior that views complete rationality as one member of a family of rationality models rather than the only way to model human behavior. Competitive institutions operate as a scaffolding structure so that individuals who fail to learn how to maximize some external value are no longer in the competitive game (Alchian 1950, Clark 1995, Satz and Ferejohn 1994). If all institutions involved strong competition, then the thin model of rationality used to explain behavior in competitive markets would be more useful. Models of human behavior based on theories consistent with our evolutionary and adaptive heritage need to join the ranks of theoretical tools used in the social and biological sciences.

Third, sufficient work by cognitive scientists, evolutionary theorists, game theorists, and social scientists in all disciplines (Axelrod 1984; Boyd and Richerson 1988, 1992; Cook and Levi 1990; Güth and Kliemt 1995; Sethi and Somanathan 1996; Simon 1985, 1997) on the use of heuristics and norms of behavior, such as reciprocity, has already been undertaken. It is now possible to continue this development toward a firmer behavioral foundation for the study of collective action to overcome social dilemmas.

Fourth, much of our current public policy analysis—particularly since Garrett Hardin's (1968) evocative paper, "The Tragedy of the Commons"—is based on an assumption that rational individuals are helplessly trapped in social dilemmas from which they cannot extract themselves without inducement or sanctions applied from the outside. Many policies based on this assumption have been subject to major failure and have exacerbated the very problems they were intended to ameliorate (Arnold and Campbell 1986, Baland and Platteau 1996, Morrow and Hull 1996). Policies based on the assumptions that individuals can learn how to devise well-tailored rules and cooperate conditionally when they participate in the design of institutions affecting them are more successful in the field (Berkes 1989, Bromley et al. 1992, Ellickson 1991, Feeny et al. 1990, McCay and Acheson 1987, McKean and Ostrom 1995, Pinkerton 1989, Yoder 1994).

Fifth, the image of citizens we provide in our textbooks affects the long-term viability of democratic regimes. Introductory textbooks that presume rational citizens will be passive consumers of political life—the masses—and focus primarily on the role of politicians and officials at a national level—the elite—do not inform future citizens of a democratic polity of the actions they need to know and can undertake. While many political scientists claim to eschew teaching the normative foundations of a democratic polity, they actually introduce a norm of cynicism and distrust without providing a vision of how citizens could do

FIGURE 1. *N*-Person Social Dilemma

Note: N players choose between cooperating (C) or not cooperating ($\sim C$). When j individuals cooperate, their payoffs are always lower than the $j-1$ individuals who do not cooperate. The predicted outcome is that no one will cooperate and all players will receive X benefits. The temptation (T) not to cooperate is the increase in benefit any cooperator would receive for switching to not cooperating. If all cooperate, they all receive $G-X$ more benefits than if all do not cooperate.

anything to challenge corruption, rent seeking,⁵ or poorly designed policies.

The remainder of this article is divided into six sections. In the first I briefly review the theoretical predictions of currently accepted rational choice theory related to social dilemmas. The next will summarize the challenge to the sole reliance on a complete model of rationality presented by extensive experimental research. Then I examine two major empirical findings that begin to show how individuals achieve results that are "better than rational" (Cosmides and Tooby 1994) by building conditions in which reciprocity, reputation, and trust can help to overcome the strong temptations of short-run self-interest. The following section raises the possibility of developing second-generation models of rationality, and the next develops an initial theoretical scenario. I conclude by examining the implications of placing reciprocity, reputation, and trust at the core of an empirically tested, behavioral theory of collective action.

THEORETICAL PREDICTIONS FOR SOCIAL DILEMMAS

The term "social dilemma" refers to a large number of situations in which individuals make independent choices in an interdependent situation (Dawes 1975, 1980; R. Hardin 1971). In all N -person social dilemmas, a set of participants has a choice of contributing (C) or not contributing ($\sim C$) to a joint benefit. While I represent this as an either-or choice in Figure 1, it

⁵ The term "rent seeking" refers to nonproductive activities directed toward creating opportunities for profits higher than would be obtained in an open, competitive market.

frequently is a choice of how much to contribute rather than whether to contribute or not.

If everyone contributes, they get a net positive benefit (G). Everyone faces a temptation (T) to shift from the set of contributors to the set of those who do not contribute. The theoretical prediction is that everyone will shift and that no one will contribute. If this happens, then the outcome will be at the intercept. The difference between the predicted outcome and everyone contributing is $G - X$. Since the less-valued payoff is at a Nash equilibrium, no one is independently motivated to change his or her choice, given the choices of other participants. These situations are dilemmas because at least one outcome exists that yields greater advantage for *all* participants. Thus, a Pareto-superior alternative exists, but rational participants making isolated choices are not predicted to realize this outcome. A conflict is posed between individual and group rationality. The problem of collective action raised by social dilemmas is to find a way to avoid Pareto-inferior equilibria and to move closer to the optimum. Those who find ways to coordinate strategies in some fashion receive a "cooperators' dividend" equal to the difference between the predicted outcome and the outcome achieved.

Many models of social dilemmas exist in the literature (see Schelling 1978 and Lichbach 1996 for reviews of alternative formalizations). In all models, a set of individuals is involved in a game in which a strategy leading to a Nash equilibrium for a single iteration of the game yields less than an optimal outcome for all involved. The equilibrium is thus Pareto inferior. The optimal outcome could be achieved if those involved "cooperated" by selecting strategies other than those prescribed by an equilibrium solution to a noncooperative game (Harsanyi and Selten 1988). Besides these assumptions regarding the structure of payoffs in the one-shot version of the game, other assumptions are made in almost all formal models of social dilemmas. (1) All participants have common knowledge of the exogenously fixed structure of the situation and of the payoffs to be received by all individuals under all combinations of strategies. (2) Decisions about strategies are made independently, often simultaneously. (3) In a symmetric game, all participants have available the same strategies. (4) No external actor (or central authority) is present to enforce agreements among participants about their choices.

When such a game is finitely repeated, participants are assumed to solve the game through backward induction. Assumptions about the particular payoff functions differ. Rather than describe the Nash equilibrium and Pareto-efficient outcome for all models considered in this article, aggregate behavior consistent with the Nash equilibrium will be described as zero cooperation, while behavior consistent with the efficient outcome will be described as 100% cooperation.

The grim predictions evoked considerable empirical challenges as well as important theoretical breakthroughs. The predictions ran counter to so many everyday experiences that some scholars turned to survey and field studies to examine the level of volun-

tary contributions to public goods (see Lichbach 1995 for a summary). Others turned to the experimental lab and confirmed much higher than predicted levels of cooperation in one-shot experiments. Game theorists were challenged to rethink their own firm conclusions and to pose new models of when cooperation might emerge (see Benoit and Krishna 1985).

The introduction of two kinds of uncertainty into repeated games—about the number of repetitions and about the types of players participating in a social dilemma—has led to more optimistic predictions. When individuals, modeled as fully rational actors with low discount rates, interact in a repeated social dilemma whose end point is determined stochastically, it is now theoretically well established that it is *possible* for them to achieve optimal or near optimal outcomes and avoid the dominant strategies of one-shot and finitely repeated games that yield suboptimal outcomes (Fudenberg and Maskin 1986). This is possible when players achieve self-enforcing equilibria by committing themselves to punish noncooperators sufficiently to deter noncooperation. Kreps et al. (1982) introduced a second kind of uncertainty related to whether all the players use complete rationality as their guide to action. The probability of the presence of an "irrational" player, who reciprocates cooperation with cooperation, is used as the grounds for a completely rational player to adopt the strategy of cooperating early in a sequence of games and switching to noncooperation at the end. Once either of these two forms of uncertainty is introduced, the number of possible equilibria explode in number (Abreau 1988). Everything is predicted: optimal outcomes, the Pareto-inferior Nash equilibria, and everything in between.

To generate predictions other than noncooperation, theorists using standard rational choice theory have found it necessary to assume real uncertainty about the duration of a situation or to assume that some players are "irrational" in their willingness to reciprocate cooperation with cooperation. To assume that if some players *irrationally* choose reciprocity, then others can *rationally* choose reciprocity is a convoluted explanation—to say the least—of the growing evidence that reciprocity is a core norm used by many individuals in social dilemma situations.

THE LACK OF A GENERAL FIT

In all the social sciences, experiments have been conducted on various types of social dilemmas for several decades. While some scholars question the value of laboratory experiments for testing the predictions of major theories in the social sciences, this method has many advantages. First, one can design experiments that test multiple predictions from the same theory under controlled conditions. Second, replication is feasible. Third, researchers can challenge whether a particular design adequately captures the theoretically posited variables and conduct further experiments to ascertain how changes in a design affect outcomes. The evidence discussed below is based on multiple studies by diverse research teams. Fourth, experimental meth-

ods are particularly relevant for studying human choice under diverse institutional arrangements. Subjects in experimental studies draw on the modes of analysis and values they have learned throughout their lives to respond to diverse incentive structures. Experiments thus allow one to test precisely whether individuals behave within a variety of institutional settings as predicted by theory (Plott 1979, Smith 1982).

In this section, I will summarize four consistently replicated findings that directly challenge the general fit between behavior observed in social-dilemma experiments and the predictions of noncooperative game theory using complete rationality and complete information for one-shot and finitely repeated social dilemmas. I focus first on the fit between theory and behavior, because the theoretical predictions are unambiguous and have influenced so much thinking across the social sciences. Experiments on market behavior do fit the predictions closely (see Davis and Holt 1993 for an overview). If one-shot and finitely repeated social-dilemma experiments were to support strongly the predictions of noncooperative game theory, then we would have a grounded theory with close affinities to a vast body of economic theory for which there is strong empirical support. We would need to turn immediately to the problem of indefinitely repeated situations for which noncooperative game theory faces an embarrassment of too many equilibria. As it turns out, we have a different story to tell. The four general findings are as follows.

1. High levels of initial cooperation are found in most types of social dilemmas, but the levels are consistently less than optimal.
2. Behavior is not consistent with backward induction in finitely repeated social dilemmas.
3. Nash equilibrium strategies are not good predictors at the individual level.
4. Individuals do not learn Nash equilibrium strategies in repeated social dilemmas.

High but Suboptimal Levels of Initial Cooperation

Most experimental studies of social dilemmas with the structure of a public-goods provision problem have found levels of cooperative actions in one-shot games, or in the first rounds of a repeated game, that are significantly above the predicted level of zero.⁶ "In a

⁶ See Isaac, McCue, and Plott 1985; Kim and Walker 1984; Marwell and Ames 1979, 1980, 1981; Orbell and Dawes 1991, 1993; Schneider and Pommerehne 1981. An important exception to this general finding is that when subjects are presented with an experimental protocol with an opportunity to invest tokens in a common-pool resource (the equivalent of harvesting from a common pool), they tend to *overinvest* substantially in the initial rounds (see E. Ostrom, Gardner, and Walker 1994 and comparison of public goods and common-pool resource experiments in Goetze 1994 and E. Ostrom and Walker 1997). Ledyard (1995) considers common-pool resource dilemmas to have the same underlying structure as public good dilemmas, but behavior in common-pool resource experiments without communication is consistently different from public good experiments without communication. With repetition, outcomes in common-pool resource experiments approach the Nash equilibrium from

wide variety of treatment conditions, participants rather persistently contributed 40 to 60 percent of their token endowments to the [public good], far in excess of the 0 percent contribution rate consistent with a Nash equilibrium" (Davis and Holt 1993, 325). Yet, once an experiment is repeated, cooperation levels in public-good experiments tend to decline. The individual variation across experiment sessions can be very great.⁷ While many have focused on the unexpectedly high rates of cooperation, it is important to note that in sparse institutional settings with no feedback about individual contributions, cooperation levels never reach the optimum. Thus, the prediction of zero levels of cooperation can be rejected, but cooperation at a suboptimal level is consistently observed in sparse institutional settings.

Behavior in Social Dilemmas Inconsistent with Backward Induction

In all finitely repeated experiments, players are predicted to look ahead to the last period and determine what they would do in that period. In the last period, there is no future interaction; the prediction is that they will not cooperate in that round. Since that choice would be determined at the beginning of an experiment, the players are presumed to look at the second-to-last period and ask themselves what they would do there. Given that they definitely would not cooperate in the last period, it is assumed that they also would not cooperate in the second-to-last period. This logic would then extend backward to the first round (Luce and Raiffa 1957, 98–9).

While backward induction is still the dominant method used in solving finitely repeated games, it has been challenged on theoretical grounds (Binmore 1997, R. Hardin 1997). Furthermore, as discussed above, uncertainty about whether others use norms like tit-for-tat rather than follow the recommendations of a Nash equilibrium may make it rational for a player to signal a willingness to cooperate in the early rounds of an iterated game and then defect at the end (Kreps et al. 1982). What is clearly the case from experimental evidence is that players do not use backward induction in their decision-making plans in an experimental laboratory. Amnon Rapoport (1997, 122) concludes from a review of several experiments focusing on resource dilemmas that "subjects are not involved in or capable of backward induction."⁸

below rather than from above, as is typical in public good experiments.

⁷ In a series of eight experiments with different treatments conducted by Isaac, Walker, and Thomas (1984), in which the uniform theoretical prediction was zero contributions, contribution rates varied from nearly 0% to around 75% of the resources available to participants.

⁸ Subjects in Centipede games also do not use backward induction (see McKelvey and Palfrey 1992).

Nash Equilibrium Strategies Do Not Predict Individual Behavior in Social Dilemmas

From the above discussion, it is obvious that individuals in social dilemmas tend not to use the predicted Nash equilibrium strategy, even though this is a good predictor at both an individual and group level in other types of situations. While outcomes frequently approach Nash equilibria at an aggregate level, the variance of individual actions around the mean is extremely large. When groups of eight subjects made appropriation decisions in repeated common-pool resource experiments of 20 to 30 rounds, the unique symmetric Nash equilibrium strategy was never played (Walker, Gardner, and Ostrom 1990). Nor did individuals use Nash equilibrium strategies in repeated public good experiments (Dudley 1993; Isaac and Walker 1991, 1993). In a recent set of thirteen experiments involving seven players making ten rounds of decisions without communication or any other institutional structure, Walker et al. (1997) did not observe a single individual choice of a symmetric Nash equilibrium strategy in the 910 opportunities available to subjects. Chan et al. (1996, 58) also found little evidence to support the use of Nash equilibria when they examined the effect of heterogeneity of income on outcomes: "It is clear that the outcomes of the laboratory sessions reported here cannot be characterized as Nash equilibria outcomes."

Individuals Do Not Learn Nash Equilibrium Strategies in Social Dilemmas

In repeated experiments without communication or other facilitating institutional conditions, levels of cooperation fall (rise) toward the Nash equilibrium in public-good (common-pool resource) experiments. Some scholars have speculated that it just takes some time and experience for individuals to learn Nash equilibrium strategies (Ledyard 1995). But this does not appear to be the case. In all repeated experiments, there is considerable pulsing as subjects obtain outcomes that vary substantially with short spurts of increasing and decreasing levels of cooperation, while the general trend is toward an aggregate that is consistent with a Nash equilibrium (Isaac, McCue, and Plott 1985; E. Ostrom, Gardner, and Walker 1994).⁹ Furthermore, there is substantial variation in the strategies followed by diverse participants within the same game (Dudley 1993; Isaac and Walker 1988b; E. Ostrom, Gardner, and Walker 1994).

It appears that subjects learn something other than Nash strategies in finitely repeated experiments. Isaac, Walker, and Williams (1994) compare the rate of decay when experienced subjects are explicitly told that an experiment will last 10, 40, or 60 rounds. The rate of decay of cooperative actions is inversely related to the

number of decision rounds. Instead of learning the noncooperative strategy, subjects appear to be learning how to cooperate at a moderate level for even longer periods. Cooperation rates approach zero only in the last few periods, whenever these occur.

TWO INTERNAL WAYS OUT OF SOCIAL DILEMMAS

The combined effect of these four frequently replicated, general findings represents a strong rejection of the predictions derived from a complete model of rationality. Two more general findings are also contrary to the predictions of currently accepted models. At the same time, they also begin to show how individuals are able to obtain results that are substantially "better than rational" (Cosmides and Tooby 1994), at least as *rational* has been defined in currently accepted models. The first is that simple, cheap talk allows individuals an opportunity to make conditional promises to one another and potentially to build trust that others will reciprocate. The second is the capacity to solve second-order social dilemmas that change the structure of the first-order dilemma.

Communication and Collective Action

In noncooperative game theory, players are assumed to be unable to make enforceable agreements.¹⁰ Thus, communication is viewed as cheap talk (Farrell 1987). In a social dilemma, self-interested players are expected to use communication to try to convince others to cooperate and promise cooperative action, but then to choose the Nash equilibrium strategy when they make their private decision (Barry and Hardin 1982, 381; Farrell and Rabin 1996, 113).¹¹ Or, as Gary Miller (1992, 25) expresses it: "It is obvious that simple communication is not sufficient to escape the dilemma."¹²

From this theoretical perspective, face-to-face communication should make no difference in the outcomes achieved in social dilemmas. Yet, consistent, strong, and replicable findings are that substantial increases in the levels of cooperation are achieved when individuals are allowed to communicate face to face.¹³ This holds

¹⁰ In cooperative game theory, in contrast, it is assumed that players can communicate and make *enforceable agreements* (Harsanyi and Selten 1988, 3).

¹¹ In social-dilemma experiments, subjects make anonymous decisions and are paid privately. The role of cheap talk in coordination experiments is different since there is no dominant strategy. In this case, preplay communication may help players coordinate on one of the possible equilibria (see Cooper, DeJong, and Forsythe 1992).

¹² As Aumann (1974) cogently points out, the players are faced with the problem that whatever they agree upon has to be self-enforcing. That has led Aumann and most game theorists to focus entirely on Nash equilibria which, once reached, are self-enforcing. In coordination games, cheap talk can be highly efficacious.

¹³ See E. Ostrom, Gardner, and Walker 1994 for extensive citations to studies showing a positive effect of the capacity to communicate. Dawes, McTavish, and Shaklee 1977; Frey and Bohnet 1996; Hackett, Schlager, and Walker 1994; Isaac and Walker 1988a, 1991; Orbell, Dawes, and van de Kragt 1990; Orbell, van de Kragt, and Dawes 1988, 1991; E. Ostrom, Gardner, and Walker 1994; Sally 1995.

⁹ The pulsing cannot be explained using a complete model of rationality, but it can be explained as the result of a heuristic used by subjects to raise or lower their investments depending upon the average return achieved on the most recent round (see E. Ostrom, Gardner, and Walker 1994).

true across all types of social dilemmas studied in laboratory settings and in both one-shot and finitely repeated experiments. In a meta-analysis of more than 100 experiments involving more than 5,000 subjects conducted by economists, political scientists, sociologists, and social psychologists, Sally (1995) finds that opportunities for face-to-face communication in one-shot experiments significantly raise the cooperation rate, on average, by more than 45 percentage points. When subjects are allowed to talk before each decision round in repeated experiments, they achieve 40 percentage points more on average than in repeated games without communication. No other variable has as strong and consistent an effect on results as face-to-face communication. Communication even has a robust and positive effect on cooperation levels when individuals are not provided with feedback on group decisions after every round (Cason and Khan 1996).

The efficacy of communication is related to the capability to talk face to face. Sell and Wilson (1991, 1992), for example, developed a public-good experiment in which subjects could signal promises to cooperate via their computer terminal. There was much less cooperation than in the face-to-face experiments using the same design (Isaac and Walker 1988a, 1991). Rocco and Warglien (1995) replicated all aspects of prior common-pool resource experiments, including the efficacy of face-to-face communication.¹⁴ They found, however, that subjects who had to rely on computerized communication did not achieve the same increase in efficiency as did those who were able to communicate face to face.¹⁵ Palfrey and Rosenthal (1988) report that no significant difference occurred in a provision point public-good experiment in which subjects could send a computerized message stating whether they intended to contribute.

The reasons offered by those doing experimental research for why communication facilitates cooperation include (1) transferring information from those who can figure out an optimal strategy to those who do not fully understand what strategy would be optimal, (2) exchanging mutual commitment, (3) increasing trust and thus affecting expectations of others' behavior, (4) adding additional values to the subjective payoff structure, (5) reinforcement of prior normative values, and (6) developing a group identity (Davis and Holt 1993; Orbell, Dawes, and van de Kragt 1990; Orbell, van de Kragt, and Dawes 1988; E. Ostrom and Walker 1997). Carefully crafted experiments demonstrate that the effect of communication is not primarily due to the first reason. When information about the individual strategy that produces an optimal joint outcome is clearly presented to subjects who are not able to communicate, the information makes little difference in outcomes achieved (Isaac, McCue, and Plott 1985; Moir 1995).

¹⁴ Moir (1995) also replicated these findings with face-to-face communication.

¹⁵ Social psychologists have found that groups who perform tasks using electronic media do much better if they have had an opportunity to work face to face prior to the use of electronic communication only (Hollingshead, McGrath, and O'Connor 1993).

Consequently, exchanging mutual commitment, increasing trust, creating and reinforcing norms, and developing a group identity appear to be the most important processes that make communication efficacious. Subjects in experiments do try to extract mutual commitment from one another to follow the strategy they have identified as leading to their best joint outcomes. They frequently go around the group and ask each person to promise the others that they will follow the joint strategy. Discussion sessions frequently end with such comments as: "Now remember everyone that we all do much better if we all follow *X* strategy" (see transcripts in E. Ostrom, Gardner, and Walker 1994). In repeated experiments, subjects use communication opportunities to lash out verbally at unknown individuals who did not follow mutually agreed strategies, using such evocative terms as scumbuckets and finks. Orbell, van de Kragt, and Dawes (1988) summarize the findings from ten years of research on one-shot public-good experiments by stressing how many mutually reinforcing processes are evoked when communication is allowed.¹⁶ Without increasing mutual trust in the promises that are exchanged, however, expectations of the behavior of others will not change. Given the very substantial difference in outcomes, communication is most likely to affect individual trust that others will keep to their commitments. As discussed below, the relationships among trust, conditional commitments, and a reputation for being trustworthy are key links in a second-generation theory of boundedly rational and moral behavior.

As stakes increase and it is difficult to monitor individual contributions, communication becomes less efficacious, however. E. Ostrom, Gardner, and Walker (1994) found that subjects achieved close to fully optimal results when each subject had relatively low endowments and was allowed opportunities for face-to-face communication. When endowments were substantially increased—increasing the temptation to cheat on prior agreements—subjects achieved far more in communication experiments as contrasted to non-communication experiments but less than in small-stake situations. Failures to achieve collective action in field settings in which communication has been feasible point out that communication alone is not a sufficient mechanism to assure successful collective action under all conditions.

Innovation and Collective Action

Changing the rules of a game or using scarce resources to punish those who do not cooperate or keep agreements are usually not considered viable options for participants in social dilemmas, since these actions create public goods. Participants face a second-order social dilemma (of equal or greater difficulty) in any effort to use costly sanctions or change the structure of a game (Oliver 1980). The predicted outcome of any effort to solve a second-order dilemma is failure.

¹⁶ See also Banks and Calvert (1992a, 1992b) for a discussion of communication in incomplete information games.

Yet, participants in many field settings and experiments do exactly this. Extensive research on how individuals have governed and managed common-pool resources has documented the incredible diversity of rules designed and enforced by participants themselves to change the structure of underlying social-dilemma situations (Blomquist 1992, Bromley et al. 1992, Lam n.d., McKean 1992, E. Ostrom 1990, Schlager 1990, Schlager and Ostrom 1993, Tang 1992). The particular rules adopted by participants vary radically to reflect local circumstances and the cultural repertoire of acceptable and known rules used generally in a region. Nevertheless, general design principles characterize successfully self-organized, sustainable, local, regional, and international regimes (E. Ostrom 1990). Most robust and long-lasting common-pool regimes involve clear mechanisms for monitoring rule conformance and graduated sanctions for enforcing compliance. Thus, few self-organized regimes rely entirely on communication alone to sustain cooperation in situations that generate strong temptations to break mutual commitments. Monitors—who may be participants themselves—do not use strong sanctions for individuals who rarely break rules. Modest sanctions indicate to rule breakers that their lack of conformance has been observed by others. By paying a modest fine, they rejoin the community in good standing and learn that rule infractions are observed and sanctioned. Repeated rule breakers are severely sanctioned and eventually excluded from the group. Rules meeting these design principles reinforce contingent commitments and enhance the trust participants have that others are also keeping their commitments.

In field settings, innovation in rules usually occurs in a continuous trial-and-error process until a rule system is evolved that participants consider yields substantial net benefits. Given the complexity of the physical world that individuals frequently confront, they are rarely ever able to “get the rules right” on the first or second try (E. Ostrom 1990). In highly unpredictable environments, a long period of trial and error is needed before individuals can find rules that generate substantial positive net returns over a sufficiently long time horizon. Nonviolent conflict may be a regular feature of successful institutions when arenas exist to process conflict cases regularly and, at times, to innovate new rules to cope with conflict more effectively (V. Ostrom 1987; V. Ostrom, Feeny, and Picht 1993).

In addition to the extensive field research on changes that participants make in the structure of situations they face, subjects in a large number of experiments have also solved second-order social dilemmas and consequently moved the outcomes in their first-order dilemmas closer to optimal levels (Dawes, Orbell, and van de Kragt 1986; Messick and Brewer 1983; Rutte and Wilke 1984; Sato 1987; van de Kragt, Orbell, and Dawes 1983; Yamagishi 1992). Toshio Yamagishi (1986), for example, conducted experiments with subjects who had earlier completed a questionnaire including items from a scale measuring trust. Subjects who ranked higher on the trust scale consistently contributed about 20% more to collective goods than those

who ranked lower. When given an opportunity to contribute to a substantial “punishment fund” to be used to fine the individual who contributed the least to their joint outcomes, however, low-trusting individuals contributed significantly more to the punishment fund and also achieved the highest level of cooperation. In the last rounds of this experiment, they were contributing 90% of their resources to the joint fund. These results, which have now been replicated with North American subjects (Yamagishi 1988a, 1988b), show that individuals who are initially the least trusting are willing to contribute to sanctioning systems and then respond more to a change in the structure of the game than those who are initially more trusting.

E. Ostrom, Walker, and Gardner (1992) also examined the willingness of subjects to pay a “fee” in order to “fine” another subject. Instead of the predicted zero use of sanctions, individuals paid fees to fine others at a level significantly above zero.¹⁷ When sanctioning was combined with a single opportunity to communicate or a chance to discuss and vote on the creation of their own sanctioning system, outcomes improved dramatically. With only a single opportunity to communicate, subjects were able to obtain an average of 85% of the optimal level of investments (67% with the costs of sanctioning subtracted). Those subjects who met face to face and agreed by majority vote on their own sanctioning system achieved 93% of optimal yield. The level of defections was only 4%, so that the costs of the sanctioning system were low, and net benefits were at a 90% level (E. Ostrom, Walker, and Gardner 1992).

Messick and his colleagues have undertaken a series of experiments designed to examine the willingness of subjects to act collectively to change institutional structures when facing common-pool resource dilemmas (see Messick et al. 1983, Samuelson et al. 1984, C. Samuelson and Messick 1986). In particular, they have repeatedly given subjects the opportunity to relinquish their individual decisions concerning withdrawals from the common resource to a leader who is given the authority to decide for the group. They have found that “people want to change the rules and bring about structural change when they observe that the common resource is being depleted” (C. Samuelson and Messick 1995, 147). Yet, simply having an unequal distribution of outcomes is not a sufficient inducement to affect the decision whether to change institutional structure.

What do these experiments tell us? They complement the evidence from field settings and show that individuals temporarily caught in a social-dilemma structure are likely to invest resources to innovate and change the structure itself in order to improve joint outcomes. They also strengthen the earlier evidence that the currently accepted, noncooperative game-

¹⁷ Furthermore, they invested more when the fine was lower or when it was more efficacious, and they tended to direct their fines to those who had invested the most on prior rounds. Given the cost of the sanctioning mechanism, subjects tended to overuse it and to end up with a less efficient outcome after sanctioning costs were subtracted from their earnings. This finding is consistent with the Boyd and Richerson (1992) result that moralistic strategies may result in negative net outcomes.

theoretical explanation relying on a particular model of the individual does not adequately predict behavior in one-shot and finitely repeated social dilemmas. Cooperative game theory does not provide a better explanation. Since both cooperative and noncooperative game theory predict extreme values, neither provides explanations for the conditions that tend to enhance or detract from cooperation levels.

The really big puzzle in the social sciences is the development of a consistent theory to explain why cooperation levels vary so much and why specific configurations of situational conditions increase or decrease cooperation in first- or second-level dilemmas. This question is important not only for our scientific understanding but also for the design of institutions to facilitate individuals' achieving higher levels of productive outcomes in social dilemmas. Many structural variables affect the particular innovations chosen and the sustainability and distributional consequences of these institutional changes (Knight 1992). A coherent theory of institutional change is not within reach, however, with a theory of individual choice that predicts no innovation will occur. We need a second-generation theory of boundedly rational, innovative, and normative behavior.

TOWARD SECOND-GENERATION MODELS OF RATIONALITY

First-generation models of rational choice are powerful engines of prediction when strong competition eliminates players who do not aggressively maximize immediate external values. While incorrectly confused with a general theory of human behavior, complete rationality models will continue to be used productively by social scientists, including the author. But the thin model of rationality needs to be viewed, as Selten (1975) points out, as the limiting case of bounded or incomplete rationality. Consistent with all models of rational choice is a general theory of human behavior that views all humans as complex, fallible learners who seek to do as well as they can given the constraints that they face and who are able to learn heuristics, norms, rules, and how to craft rules to improve achieved outcomes.

Learning Heuristics, Norms, and Rules

Because individuals are boundedly rational, they do not calculate a complete set of strategies for every situation they face. Few situations in life generate information about all potential actions that one can take, all outcomes that can be obtained, and all strategies that others can take. In a model of complete rationality, one simply assumes this level of information. In field situations, individuals tend to use heuristics—rules of thumb—that they have learned over time regarding responses that tend to give them good outcomes in particular kinds of situations. They bring these heuristics with them when they participate in laboratory experiments. In frequently encountered, repetitive situations, individuals learn better and better heuristics that are tailored to particular situations.

With repetition, sufficiently large stakes, and strong competition, individuals may learn heuristics that approach best-response strategies.

In addition to learning instrumental heuristics, individuals also learn to adopt and use norms and rules. By *norms* I mean that the individual attaches an internal valuation—positive or negative—to taking particular types of action. Crawford and Ostrom (1995) refer to this internal valuation as a delta parameter that is added to or subtracted from the objective costs of an action.¹⁸ Andreoni (1989) models individuals who gain a “warm glow” when they contribute resources that help others more than they help themselves in the short term. Knack (1992) refers to negative internal valuations as “duty.”¹⁹ Many norms are learned from interactions with others in diverse communities about the behavior that is expected in particular types of situations (Coleman 1987). The change in preferences represents the internalization of particular moral lessons from life (or from the training provided by one's elders and peers).²⁰ The strength of the commitment (Sen 1977) made by an individual to take particular types of future actions (telling the truth, keeping promises) is reflected in the size of the delta parameter. After experiencing repeated benefits from other people's cooperative actions, an individual may resolve that s/he should always initiate cooperative actions in the future.²¹ Or, after many experiences of being the “sucker” in such experiences, an individual may resolve never to be the first to cooperate.

Since norms are learned in a social milieu, they vary substantially across cultures, across individuals within any one culture, within individuals across different types of situations they face, and across time within any particular situation. The behavioral implications of assuming that individuals acquire norms do not vary substantially from the assumption that individuals learn to use heuristics. One may think of norms as heuristics that individuals adopt from a moral perspective, in that these are the kinds of actions they wish to follow in living their life. Once some members of a population acquire norms of behavior, they affect the expectations of others.

By *rules* I mean that a group of individuals has

¹⁸ When constructing formal models, one can include overt delta parameters in the model (see Crawford and Ostrom 1995, Palfrey and Rosenthal 1988). Alternatively, one can assume that these internal delta parameters lead individuals to enter new situations with differing probabilities that they will follow norms such as reciprocity. These probabilities not only vary across individuals but also increase or decrease as a function of the specific structural parameters of the situation and, in repeated experiments, the patterns of behavior and outcomes achieved in that situation over time.

¹⁹ The change in valuations that an individual may attach to an action-outcome linkage may be generated strictly internally or may be triggered by external observation and, thus, a concern with how others will evaluate the normative appropriateness of actions.

²⁰ Gouldner (1960, 171) considers norms of reciprocity to be universal and as important in most cultures as incest taboos, even though the “concrete formulations may vary with time and place.”

²¹ See Selten (1986) for a discussion of his own and John Harsanyi's (1977) conception of “rule utilitarianism” as contrasted to “act utilitarianism.”

developed shared understandings that certain actions in particular situations must, must not, or may be undertaken and that sanctions will be taken against those who do not conform. The distinction between internalized but widely shared norms for what are appropriate actions in broad types of situations and rules that are self-consciously adopted for use in particular situations is at times difficult to draw when doing fieldwork. Analytically, individuals can be thought of as learning norms of behavior that are general and fit a wide diversity of particular situations. Rules are artifacts related to particular actions in specific situations (V. Ostrom 1980, 1997). Rules are created in private associations as well as in more formalized public institutions, where they carry the additional legal weight of being enforced legal enactments.²² Rules can enhance reciprocity by making mutual commitments clear and overt. Alternatively, rules can assign authority to act so that benefits and costs are distributed inequitably and thereby destroy reliance on positive norms.

Reciprocity: An Especially Important Class of Norms

That humans rapidly learn and effectively use heuristics, norms, and rules is consistent with the lessons learned from evolutionary psychology (see Barkow, Cosmides, and Tooby 1992), evolutionary game theory (see Güth and Kliemt 1996, Hirshleifer and Rasmusen 1989),²³ biology (Trivers 1971), and bounded rationality (Selten 1990, 1991; Selten, Mitzkewitz, and Uhlich 1997; Simon 1985). Humans appear to have evolved specialized cognitive modules for diverse tasks, including making sense out of what is seen (Marr 1982), inferring rules of grammar by being exposed to adult speakers of a particular language (Pinker 1994), and increasing their long-term returns from interactions in social dilemmas (Cosmides and Tooby 1992). Humans dealt with social dilemmas related to rearing and protecting offspring, acquiring food, and trusting one another to perform future promised action millennia before such oral commitments could be enforced by external authorities (de Waal 1996). Substantial evidence has been accumulated (and reviewed in Cosmides and Tooby 1992) that humans inherit a strong capacity to learn reciprocity norms and social rules that enhance the opportunities to gain benefits from coping with a multitude of social dilemmas.

Reciprocity refers to a family of strategies that can be used in social dilemmas involving (1) an effort to identify who else is involved, (2) an assessment of the likelihood that others are conditional cooperators, (3) a decision to cooperate initially with others if others are trusted to be conditional cooperators, (4) a refusal to cooperate with those who do not reciprocate, and

(5) punishment of those who betray trust. All reciprocity norms share the common ingredients that individuals tend to react to the positive actions of others with positive responses and the negative actions of others with negative responses. Reciprocity is a basic norm taught in all societies (see Becker 1990, Blau 1964, Gouldner 1960, Homans 1961, Oakerson 1993, V. Ostrom 1997, Thibaut and Kelley 1959).

By far the most famous reciprocal strategy—tit-for-tat—has been the subject of considerable study from an evolutionary perspective. In simulations, pairs of individuals are sampled from a population, and they then interact with one another repeatedly in a prisoners' dilemma game. Individuals are each modeled as if they had inherited a strategy that included the fixed maxims of always cooperate, always defect, or the reciprocating strategy of tit-for-tat (cooperate first, and then do whatever the others did in the last round). Axelrod and Hamilton (1981) and Axelrod (1984) have shown that when individuals are grouped so that they are more likely to interact with one another than with the general population, and when the expected number of repetitions is sufficiently large, reciprocating strategies such as tit-for-tat can successfully invade populations composed of individuals following an all-defect strategy. The size of the population in which interactions are occurring may need to be relatively small for reciprocating strategies to survive potential errors of players (Bendor and Mookherjee 1987; but see Boyd and Richerson 1988, 1992; Hirshleifer and Rasmusen 1989; Yamagishi and Takahashi 1994).

The reciprocity norms posited to help individuals gain larger cooperators' dividends depend upon the willingness of participants to use retribution to some degree. In tit-for-tat, for example, an individual must be willing to "punish" a player who defected in the last round by defecting in the current round. In grim trigger, an individual must be willing to cooperate initially but then "punish" everyone for the rest of the game if any defection is noticed in the current round.²⁴

Human beings do not inherit particular reciprocity norms via a biological process. The argument is more subtle. Individuals inherit an acute sensitivity for learning norms that increase their own long-term benefits when confronting social dilemmas with others who have learned and value similar norms. The process of growing up in any culture provides thousands of incidents (learning trials) whereby parents, siblings, friends, and teachers provide the specific content of the type of mutual expectations prevalent in that culture. As Mueller (1986) points out, the first dilemmas that humans encounter are as children. Parents reward and punish them until cooperation is a learned response. In

²² Crawford and Ostrom (1995) discuss these issues in greater depth. See also Piaget ([1932] 1969).

²³ The evolutionary approach has been strongly influenced by the work of Robert Axelrod (see, in particular, Axelrod 1984, 1986; Axelrod and Hamilton 1981; and Axelrod and Keohane 1985).

²⁴ The grim trigger has been used repeatedly as a support for cooperative outcomes in infinitely (or indefinitely) repeated games (Fudenberg and Maskin 1986). In games in which substantial joint benefits are to be gained over the long term from mutual cooperation, the threat of the grim trigger is thought to be sufficient to encourage everyone to cooperate. A small error on the part of one player or exogenous noise in the payoff function, however, makes this strategy a dangerous one to use in larger groups, where the cooperators' dividend may also be substantial.

the contemporary setting, corporate managers strive for a trustworthy corporate reputation by continuously reiterating and rewarding the use of key principles or norms by corporate employees (Kreps 1990).

Since particular reciprocity norms are *learned*, not everyone learns to use the same norms in all situations. Some individuals learn norms of behavior that are not so "nice." Clever and unscrupulous individuals may learn how to lure others into dilemma situations and then defect on them. It is possible to gain substantial resources by such means, but one has to hide intentions and actions, to keep moving, or to gain access to power over others. In any group composed only of individuals who follow reciprocity norms, skills in detecting and punishing cheaters could be lost. If this happens, it will be subject to invasion and substantial initial losses by clever outsiders or local deviants who can take advantage of the situation. Being too trusting can be dangerous. The presence of some untrustworthy participants hones the skills of those who follow reciprocity norms.

Thus, individuals vary substantially in the probability that they will use particular norms, in how structural variables affect their level of trust and willingness to reciprocate cooperation in a particular situation, and in how they develop their own reputation. Some individuals use reciprocity only in situations in which there is close monitoring and strong retribution is likely. Others will only cooperate in dilemmas when they have publicly committed themselves to an agreement and have assurances from others that their trust will be returned. Others find it easier to build an external reputation by building their own personal identity as someone who always trusts others until proven wrong. If this trust proves to be misplaced, then they stop cooperating and either exit the situation or enter a punishment phase. As Hoffman, McCabe, and Smith (1996a, 23–4) express it:

A one-shot game in the laboratory is part of a life-long sequence, not an isolated experience that calls for behavior that deviates sharply from one's reputational norm. Thus we should expect subjects to rely upon reciprocity norms in experimental settings unless they discover in the process of participating in a particular experiment that reciprocity is punished and other behaviors are rewarded. In such cases they abandon their instincts and attempt other strategies that better serve their interests.

In any population of individuals, one is likely to find some who use one of three reciprocity norms when they confront a repeated social dilemma.²⁵

1. Always cooperate first; stop cooperating if others do not reciprocate; punish noncooperators if feasible.
2. Cooperate immediately only if one judges others to be trustworthy; stop cooperating if others do not reciprocate; punish noncooperators if feasible.
3. Once cooperation is established by others, cooperate oneself; stop cooperating if others do not reciprocate; punish noncooperators if feasible.

In addition, one may find at least three other norms.

4. Never cooperate.
5. Mimic (1) or (2), but stop cooperating if one can successfully free ride on others.
6. Always cooperate (an extremely rare norm in all cultures).

The proportion of individuals who follow each type of norm will vary from one subpopulation to another and from one situation to another.²⁶ Whether reciprocity is advantageous to individuals depends sensitively on the proportion of other individuals who use reciprocity and on an individual's capacity to judge the likely frequency of reciprocators in any particular situation and over time. When there are many others who use a form of reciprocity that always cooperates first, then even in one-shot situations cooperation may lead to higher returns when diverse situations are evaluated together. Boundedly rational individuals would expect other boundedly rational individuals to follow a *diversity* of heuristics, norms, and strategies rather than expect to find others who adopt a single strategy—except in those repeated situations in which institutional selection processes sort out those who do not search out optimal strategies. Investment in detection of other individuals' intentions and actions improves one's own outcomes. One does not have to assume that others are "irrational" in order for it to be rational to use reciprocity (Kreps et al. 1982).

Evidence of the Use of Reciprocity in Experimental Settings

Laboratory experiments provide evidence that a substantial proportion of individuals use reciprocity norms even in the very short-term environments of an experiment (McCabe, Rassenti, and Smith 1996). Some evidence comes from experiments on ultimatum games. In such games, two players are asked to divide a fixed sum of money. The first player suggests a division to the second, who then decides to accept or reject the offer. If the offer is accepted, then the funds are divided as proposed. If it is rejected, then both players receive zero. The predicted equilibrium is that the first player will offer a minimal unit to the second player, who will then accept anything more than zero. This prediction has repeatedly been falsified, starting with the work of Güth, Schmittberger, and Schwarze (1982; see Frey and Bohnet 1996; Güth and Tietz 1990; Roth 1995; Samuelson, Gale, and Binmore 1995).²⁷ Subjects assigned to the first position tend to offer

²⁵ This is not the complete list of all types of reciprocity norms, but it captures the vast majority.

²⁶ The proportion of individuals who follow the sixth norm—cooperate always—will be minuscule or nonexistent. Individuals following the first norm will be those, along with those following the sixth norm, who cooperate in the first few rounds of a finitely repeated experimental social dilemma without prior communication. Individuals following the second norm will cooperate (immediately) in experiments if they have an opportunity to judge the intentions and trustworthiness of the other participants and expect most of the others to be trustworthy. Those following the third norm will cooperate (after one or a few rounds) in experiments in which others cooperate.

²⁷ The results obtained by Hoffman, McCabe, and Smith (1996b) related to dictator games under varying conditions of social distance are also quite consistent with the behavioral approach of this article.

substantially more than the minimum unit. They frequently offer the "fair" division of splitting the sum. Second movers tend to reject offers that are quite small. The acceptance level for offers tends to cluster around different values in diverse cultures (Roth et al. 1991). Given that the refusal to accept the funds offered contradicts a basic tenet in the complete model of rationality, these findings have represented a major challenge to the model's empirical validity in this setting.

Several hypotheses have been offered to explain these findings, including a "punishment hypothesis" and a "learning hypothesis."

The punishment hypothesis is in essence a reciprocity argument. In contrast to adaptive learning, punishment attributes a motive to the second mover's rejection of an unequal division asserting that it is done to punish the first mover for unfair treatment. This propensity toward negative reciprocity is the linchpin of the argument. Given this propensity, first movers should tend to shy away from the perfect equilibrium offer out of fear of winding up with nothing (Abbink et al. 1996, 6).

Abbink and his colleagues designed an experiment in which the prediction of the learning and punishment hypotheses is clearly different and found strong support for the punishment hypothesis. "We found that second movers were three times more likely to reject the unequal split when doing so punished the first mover . . . than when doing so rewarded the first mover" (Abbink et al. 1996, 15–6). Consequently, second movers do appear to punish first movers who propose unfair divisions.

Two additional findings from one-shot social dilemmas provide further evidence of the behavioral propensities of subjects. First, those who intend to cooperate in a particular one-shot social dilemma also expect cooperation to be returned by others at a much higher rate than those who intend to defect (Dawes, McTavish, and Shaklee 1977; Dawes, Orbell, and van de Kragt 1986). As Orbell and Dawes (1991, 519) summarize their own work: "One of our most consistent findings throughout these studies—a finding replicated by others' work—is that cooperators expect significantly more cooperation than do defectors." Second, when there is a choice whether to participate in a social dilemma, those who intend to cooperate exhibit a greater willingness to enter such transactions (Orbell and Dawes 1993). Given these two tendencies, reciprocators are likely to be more optimistic about finding others following the same norm and disproportionately enter more voluntary social dilemmas than nonreciprocators. Given both propensities, the feedback from such voluntary activities will generate confirmatory evidence that they have adopted a norm which serves them well over the long run.

Thus, while individuals vary in their propensity to use reciprocity, the evidence from experiments shows that a substantial proportion of the population drawn on by social science experiments has sufficient trust that others are reciprocators to cooperate with them even in one-shot, no-communication experiments. Furthermore, a substantial proportion of the population is also

willing to punish noncooperators (or individuals who do not make fair offers) at a cost to themselves. Norms are learned from prior experience (socialization) and are affected by situational variables yielding systematic differences among experimental designs. The level of trust and resulting levels of cooperation can be increased by (1) providing subjects with an opportunity to see one another (Frey and Bohnet 1996, Orbell and Dawes 1991), (2) allowing subjects to choose whether to enter or exit a social-dilemma game (Orbell and Dawes 1991, 1993; Orbell, Schwartz-Shea, and Simmons 1984; Schuessler 1989; Yamagishi 1988c; Yamagishi and Hayashi 1996), (3) sharing the costs equally if a minimal set voluntarily contributes to a public good (Dawes, Orbell, and van de Kragt 1986), (4) providing opportunities for distinct punishments of those who are not reciprocators (Abbink et al. 1996; McCabe, Rassenti, and Smith 1996), and, as discussed above, (5) providing opportunities for face-to-face communication.

The Core Relationships: Reciprocity, Reputation, and Trust

When many individuals use reciprocity, there is an incentive to acquire a *reputation* for keeping promises and performing actions with short-term costs but long-term net benefits (Keohane 1984; Kreps 1990; Milgrom, North, and Weingast 1990; Miller 1992). Thus, trustworthy individuals who trust others with a reputation for being trustworthy (and try to avoid those who have a reputation for being untrustworthy) can engage in mutually productive social exchanges, even though they are dilemmas, so long as they can limit their interactions primarily to those with a reputation for keeping promises. A reputation for being trustworthy, or for using retribution against those who do not keep their agreements or keep up their fair share, becomes a valuable asset. In an evolutionary context, it increases fitness in an environment in which others use reciprocity norms. Similarly, developing *trust* in an environment in which others are trustworthy is also an asset (Braithwaite and Levi n.d., Fukuyama 1995, Gambetta 1988, Putnam 1993). Trust is the expectation of one person about the actions of others that affects the first person's choice, when an action must be taken before the actions of others are known (Dasgupta 1997, 5). In the context of a social dilemma, trust affects whether an individual is willing to initiate cooperation in the expectation that it will be reciprocated. Boundedly rational individuals enter situations with an initial probability of using reciprocity based on their own prior training and experience.

Thus, at the core of a behavioral explanation are the links between the trust that individuals have in others, the investment others make in trustworthy reputations, and the probability that participants will use reciprocity norms (see Figure 2). This mutually reinforcing core is affected by structural variables as well as the past experiences of participants. In the initial round of a repeated dilemma, individuals do or do not initiate cooperative behavior based on their own norms, how

FIGURE 2. The Core Relationships

much trust they have that others are reciprocators (based on any information they glean about one another), and how structural variables affect their own and their expectation of others' behavior.

If initial levels of cooperation are moderately high, then individuals may learn to trust one another, and more may adopt reciprocity norms. When more individuals use reciprocity norms, gaining a reputation for being trustworthy is a better investment. Thus, levels of trust, reciprocity, and reputations for being trustworthy are positively reinforcing. This also means that a decrease in any one of these can lead to a downward spiral. Instead of explaining levels of cooperation directly, this approach leads one to link structural variables to an inner triangle of trust, reciprocity, and reputation as these, in turn, affect levels of cooperation and net benefits.

Communication and the Core Relationships

With these core relationships, one can begin to explain why repeated face-to-face communication substantially changes the structure of a situation (see discussion in E. Ostrom, Gardner, and Walker 1994, 199). With a repeated chance to see and talk with others, a participant can assess whether s/he trusts others sufficiently to try to reach a simple contingent agreement regarding the level of joint effort and its allocation. In a contingent agreement, individuals agree to contribute *X* resources to a common effort so long as at least *Y* others also contribute. Contingent agreements do not need to include all those who benefit. The benefit to be obtained from the contribution of *Y* proportion of those affected may be so substantial that some individuals are willing to contribute so long as *Y* proportion of others also agree and perform.

Communication allows individuals to increase (or decrease) their trust in the reliability of others.²⁸ When successful, individuals change their expectations from the initial probability that others use reciprocity norms to a higher probability that others will reciprocate trust and cooperation. When individuals are symmetric in assets and payoffs, the simplest agreement is to share a contribution level equally that closely approximates the optimum joint outcome. When individuals are not symmetric, finding an agreement is more difficult, but

various fairness norms can be used to reduce the time and effort needed to achieve an agreement (see Hackett, Dudley, and Walker 1995; Hackett, Schlager, and Walker 1994).

Contingent agreements may deal with punishment of those who do not cooperate (Levi 1988). How to punish noncooperative players, keep one's own reputation, and sustain any initial cooperation that has occurred in *N*-person settings is more difficult than in two-person settings.²⁹ In an *N*-person, uncertain situation, it is difficult to interpret from results that are less than expected whether one person cheated a lot, several people cheated a little, someone made a mistake, or everyone cooperated and an exogenous random variable reduced the expected outcome. If there is no communication, then the problem is even worse. Without communication and an agreement on a sharing formula, individuals can try to signal a willingness to cooperate through their actions, but no one has agreed to any particular contribution. Thus, no one's reputation (external or internal) is at stake.

Once a verbal agreement in an *N*-person setting is reached, that becomes the focal point for further action within the context of a particular ongoing group. If everyone keeps to the agreement, then no further reaction is needed by someone who is a reciprocator. If the agreement is not kept, however, then an individual following a reciprocity norm—without any prior agreement regarding selective sanctions for nonconformance—needs to punish those who did not keep their commitment. A frequently posited punishment is the grim trigger, whereby a participant plays the Nash equilibrium strategy forever upon detecting any cheating. Subjects in repeated experiments frequently discuss the use of a grim trigger to punish mild defections but reject the idea because it would punish everyone—not just the cheater(s) (E. Ostrom, Gardner, and Walker 1994). A much less drastic punishment strategy is the measured reaction. “In a measured reaction, a player reacts mildly (if at all) to a small deviation from an agreement. Defections trigger mild reactions instead of harsh punishments. If defections continue over time, the measured response slowly moves from the point of agreement toward the Nash equilibrium” (pp. 199–200).

For several reasons, this makes sense as the initial “punishment” phase in an *N*-person setting with a minimal institutional structure and no feedback concerning individual contributions. If only a small deviation occurs, then the cooperation of most participants is already generating positive returns. By keeping one's own reaction close to the agreement, one keeps up

²⁸ Frank, Gilovich, and Regan (1993) found, for example, that the capacity of subjects to predict whether others would play cooperatively was significantly better than chance after a face-to-face group discussion. Kikuchi, Watanabe, and Yamagishi (1996) found that high trusters predicted other players' trustworthiness significantly better than did low trusters.

²⁹ In a two-person situation of complete certainty, individuals can easily follow the famous tit-for-tat (or tit-for-tat or exit) strategy even without communication. When a substantial proportion of individuals in a population follows this norm, and they can identify with whom they have interacted in the past (to either refuse future interactions or to punish prior uncooperative actions), and when discount rates are sufficiently low, tit-for-tat has been shown to be a highly successful strategy, yielding higher payoffs than are available to those using other strategies (Axelrod 1984, 1986). With communication, it is even easier.

one's own reputation for cooperation, keeps cooperation levels higher, and makes it easier to restore full conformance. Using something like a grim trigger immediately leads to the unraveling of the agreement and the loss of substantial benefits over time. To supplement the measured reaction, effort is expended on determining who is breaking the agreement, on using verbal rebukes to try to get that individual back in line, and on avoiding future interactions with that individual.³⁰

Thus, understanding how trust, reciprocity, and reputation feed one another (or their lack, which generates a cascade of negative effects) helps to explain why repeated, face-to-face communication has such a major effect. Coming to an initial agreement and making personal promises to one another places at risk an individual's own identity as one who keeps one's word, increases trust, and makes reciprocity an even more beneficial strategy. Tongue-lashing can be partially substituted in a small group for monetary losses and, when backed by measured responses, can keep many groups at high levels of cooperation. Meeting only once can greatly increase trust, but if some individuals do not cooperate immediately, the group never has a further opportunity to hash out these problems. Any evidence of lower levels of cooperation undermines the trust established in the first meeting, and there is no further opportunity to build trust or use verbal sanctioning. It is also clearer now why sending anonymous, computerized messages is not as effective as face-to-face communication. Individuals judge one another's trustworthiness by watching facial expressions and hearing the way something is said. It is hard to establish trust in a group of strangers who will make decisions independently and privately without seeing and talking with one another.

ILLUSTRATIVE THEORETICAL SCENARIOS

I have tried to show the need for the development of second-generation models of rationality in order to begin a coherent synthesis of what we know from empirical research on social dilemmas. Rather than try to develop a new formal model, I have stayed at the theoretical level to identify the attributes of human behavior that should be included in future formal models. The individual attributes that are particularly important in explaining behavior in social dilemmas include the expectations individuals have about others' behavior (trust), the norms individuals learn from socialization and life's experiences (reciprocity), and the identities individuals create that project their in-

tentions and norms (reputation). Trust, reciprocity, and reputation can be included in formal models of individual behavior (see the works cited by Boyd and Richerson 1988, Güth and Yaari 1992, Nowak and Sigmund 1993).

In this section, I construct theoretical scenarios of how exogenous variables combine to affect endogenous structural variables that link to the core set of relationships shown in Figure 2. It is not possible to relate all structural variables in one large causal model, given the number of important variables and the fact that many depend for their effect on the values of other variables. It is possible, however, to produce coherent, cumulative, theoretical scenarios that start with relatively simple baseline models. One can then begin the systematic exploration of what happens as one variable is changed. Let me illustrate what I mean by theoretical scenarios.

Let us start with a scenario that should be conducive to cooperation—a small group of ten farmers who own farms of approximately the same size. These farmers share the use of a creek for irrigation that runs by their relatively flat properties. They face the problem each year of organizing one collective workday to clear out the fallen trees and brush from the prior winter. All ten expect to continue farming into the indefinite future. Let us assume that the creek delivers a better water supply directly in response to how many days of work are completed. All farmers have productive opportunities for their labor that return more at the margin than the return they would receive from their own input into this effort. Thus, free riding and hoping that the others contribute labor is objectively attractive. The value to each farmer, however, of participation in a successful collective effort to clear the creek is greater than the costs of participating.

Now let us examine how some structural variables affect the likelihood of collective action (see Figure 3). As a small group, it would be easy for them to engage in face-to-face communication. Since their interests and resources are relatively symmetric, arriving at a fair, contingent agreement regarding how to share the work should not be too difficult. One simple agreement that is easy to monitor is that they all work on the same day, but each is responsible for clearing the part of the creek going through his or her property. Conformance to such an agreement would be easy to verify. While engaged in discussions, they can reinforce the importance of everyone participating in the workday. In face-to-face meetings, they can also gossip about anyone who failed to participate in the past, urge them to change their ways, and threaten to stop all labor contributions if they do not "shape up." Given the small size of the group, its symmetry, and the relatively low cost of providing the public good, combined with the relatively long time horizon, we can predict with some confidence that a large proportion of individuals facing such a situation will find a way to cooperate and overcome the dilemma. Not only does the evidence from experimental research support that prediction, but also substantial evidence from the field is consistent with this explanation (see E. Ostrom n.d.).

³⁰ In a series of 18 common-pool resource experiments, each involving eight subjects in finitely repeated communication experiments, E. Ostrom, Gardner, and Walker (1994, 215) found that subjects kept to their agreements or used measured responses in two-thirds of the experiments. In these experiments, joint yields averaged 89% of optimum. In the six experiments in which some players deviated substantially from agreements and measured responses did not bring them back to the agreement, cooperation levels were substantially less, and yields averaged 43% of optimum (which is still far above zero levels of cooperation).

FIGURE 3. A Simple Scenario

This is a rough but coherent causal theory that uses structural variables (small size, symmetry of assets and resources, long time horizon, and a low-cost production function) to predict with high probability that participants can themselves solve this social dilemma. Changes in any of the structural variables of this relatively easy scenario affect that prediction. Even a small change may suffice to reverse the predicted outcome. For example, assume that another local farmer buys five parcels of land with the plan to farm them for a long time. Now there are only six farmers, but one of them holds half the relevant assets. If that farmer shares the norm that it is fair to share work allocated to a collective benefit in the same ratio as the benefits are allocated, then the increased heterogeneity will not be a difficult problem to overcome. They would agree—as farmers around the world have frequently agreed (see Lam n.d., Tang 1992)—to share the work in proportion to the amount of land they own. If the new farmer uses a different concept of fairness, then the smaller group may face a more challenging problem than the larger group due to its increased heterogeneity.

Now, assume that the five parcels of land are bought by a local developer to hold for future use as a suburban housing development. The time horizon of one of the six actors—the developer—is extremely short with regard to investments in irrigation. From the developer's perspective, he is not a "free rider," as he sees no benefit to clearing out the creek. Thus, such a

change actually produces several: A decrease in the N of the group, an introduction of an asymmetry of interests and resources, and the presence of one participant with half the resources but a short time horizon and no interest in the joint benefit. This illustrates how changes in one structural variable can lead to a cascade of changes in the others, and thus how difficult it is to make simple bivariate hypotheses about the effect of one variable on the level of cooperation. In particular, this smaller group is much less likely to cooperate than the larger group of ten symmetric farmers, exactly the reverse of the standard view of the effect of group size.

IMPLICATIONS

The implications of developing second-generation models of empirically grounded, boundedly rational, and moral decision making are substantial. Puzzling research questions can now be addressed more systematically. New research questions will open up. We need to expand the type of research methods regularly used in political science. We need to increase the level of understanding among those engaged in formal theory, experimental research, and field research across the social and biological sciences. The foundations of policy analysis need rethinking. And civic education can be based on empirically validated theories of

collective action empowering citizens to use the "science and art of association" (Tocqueville [1835 and 1840] 1945) to help sustain democratic polities in the twenty-first century.

Implications for Research

What the research on social dilemmas demonstrates is a world of *possibility* rather than of *necessity*. We are neither trapped in inexorable tragedies nor free of moral responsibility for creating and sustaining incentives that facilitate our own achievement of mutually productive outcomes. We cannot adopt the smug presumption of those earlier group theorists who thought groups would always form whenever a joint benefit would be obtained. We can expect many groups to fail to achieve mutually productive benefits due to their lack of trust in one another or to the lack of arenas for low-cost communication, institutional innovation, and the creation of monitoring and sanctioning rules (V. Ostrom 1997). Nor can we simply rest assured that only one type of institution exists for all social dilemmas, such as a competitive market, in which individuals pursuing their own preferences are led to produce mutually productive outcomes. While new institutions often facilitate collective action, the key problems are to design new rules, motivate participants to conform to rules once they are devised, and find and appropriately punish those who cheat. Without individuals viewing rules as appropriate mechanisms to enhance reciprocal relationships, no police force and court system on earth can monitor and enforce all the needed rules on its own. Nor would most of us want to live in a society in which police were really the thin blue line enforcing all rules.

While I am proposing a further development of second-generation theories of rational choice, theories based on complete but thin rationality will continue to play an important role in our understanding of human behavior. The clear and unambiguous predictions stemming from complete rational choice theories will continue to serve as a critical benchmark in conducting empirical studies and for measuring the success or failure of any other explanation offered for observed behavior. A key research question will continue to be: What is the difference between the predicted equilibrium of a complete rationality theory and observed behavior? Furthermore, game theorists are already exploring ways of including reputation, reciprocity, and various norms of behavior in game-theoretic models (see Abbink et al. 1996; Güth 1995; Kreps 1990; Palfrey and Rosenthal 1988; Rabin 1994; Selten 1990, 1991). Thus, bounded and complete rationality models may become more complementary in the next decade than appears to be the case today.

For political scientists interested in diverse institutional arrangements, complete rational choice theories provide well-developed methods for analyzing the vulnerability of institutions to the strategies devised by talented, analytically sophisticated, short-term hedonists (Brennan and Buchanan 1985). Any serious institutional analysis should include an effort to understand

how institutions—including ways of organizing legislative procedures, formulas used to calculate electoral weights and minimal winning coalitions, and international agreements on global environmental problems—are vulnerable to manipulation by calculating, amoral participants.³¹ In addition to the individuals who have learned norms of reciprocity in any population, others exist who may try to subvert the process so as to obtain very substantial returns for themselves while ignoring the interests of others. One should always know the consequences of letting such individuals operate in any particular institutional setting.

The most immediate research questions that need to be addressed using second-generation models of human behavior relate to the effects of structural variables on the likelihood of organizing for successful modes of collective action. It will not be possible to relate all structural variables in one large causal theory, given that they are so numerous and that many depend for their effect on the values of other variables. What is possible, however, is the development of coherent, cumulative, theoretical scenarios that start with relatively simple baseline models and then proceed to change one variable at a time, as briefly illustrated above. From such scenarios, one can proceed to formal models and empirical testing in field and laboratory settings. The kind of *theory* that emerges from such an enterprise does not lead to the global bivariate (or even multivariate) predictions that have been the ideal to which many scholars have aspired. Marwell and Oliver (1993) have constructed such a series of theoretical scenarios for social dilemmas involving large numbers of heterogeneous participants in collective action. They have come to a similar conclusion about the nature of the theoretical and empirical enterprise: "This is not to say that general theoretical predictions are impossible using our perspective, only that they cannot be simple and global. Instead, the predictions that we can validly generate must be complex, interactive, and conditional" (p. 25).

As political scientists, we need to recognize that political systems are complexly organized and that we will rarely be able to state that one variable is always positively or negatively related to a dependent variable. One can do comparative statics, but one must know the value of the other variables and not simply assume that they vary around the average.

The effort to develop second-generation models of boundedly rational and moral behavior will open up a variety of *new* questions to be pursued that are of major importance to all social scientists and many biologists interested in human behavior. Among these questions are: How do individuals gain trust in other individuals? How is trust affected by diverse institutional arrangements? What verbal and visual clues are used in evaluating others' behavior? How do individuals gain

³¹ Consequently, research on the effect of institutional arrangements on strategies and outcomes continues to be crucial to future developments. See Agrawal n.d.; Alt and Shepsle 1990; Bates 1989; Dasgupta 1993; Eggertsson 1990; Gibson n.d.; Levi 1997; V. Ostrom 1997; V. Ostrom, Feeny, and Picht 1993; Scharpf 1997.

common understanding so as to craft and follow self-organized arrangements (V. Ostrom 1990)? John Orbell (personal communication) posits a series of intriguing questions: "Why do people join together in these games in the first place? How do we select partners in these games? How do our strategies for selecting individual partners differ from our strategies for adding or removing individuals from groups?"

An important set of questions is related to how institutions enhance or restrict the building of mutual trust, reciprocity, and reputations. A recent set of studies on tax compliance raises important questions about the trust heuristics used by citizens and their reactions to governmental efforts to monitor compliance (see Scholz n.d.). Too much monitoring may have the counterintuitive result that individuals feel they are *not* trusted and thus become less trustworthy (Frey 1993). Bruno Frey (1997) questions whether some formal institutional arrangements, such as social insurance and paying people to contribute effort, reduce the likelihood that individuals continue to place a positive intrinsic value on actions taken mainly because of internal norms. Rather, they may assume that formal organizations are charged with the responsibility of taking care of joint needs and that reciprocity is no longer needed (see also Taylor 1987).

Since all rules legitimate the use of sanctions against those who do not comply, rules can be used to assign benefits primarily to a dominant coalition. Those who are, thus, excluded have no motivation to cooperate except in order to avoid sanctions. Using first-generation models, that is what one expects in any case. Using second-generation models, one is concerned with how constitutional and collective-choice rules affect the distribution of benefits and the likelihood of reciprocal cooperation. While much research has been conducted on long-term successful self-organized institutions, less has been documented about institutions that never quite got going or failed after years of success. More effort needs to be made to find reliable archival information concerning these failed attempts and why they failed.

It may be surprising that I have relied so extensively on experimental research. I do so for several reasons. As theory becomes an ever more important core of our discipline, experimental studies will join the ranks of basic empirical research methods for political scientists. As an avid field researcher for the past 35 years, I know the importance and difficulty of testing theory in field settings—particularly when variables function interactively. Large-scale field studies will continue to be an important source of empirical data, but frequently they are a very expensive and inefficient method for addressing how institutional incentives combine to affect individual behavior and outcomes. We can advance much faster and more coherently when we examine hypotheses about contested elements among diverse models or theories of a coherent framework. Careful experimental research designs frequently help sort out competing hypotheses more effectively than does trying to find the precise combination of variables in the field. By adding experimental methods to the

battery of field methods already used extensively, the political science of the twenty-first century will advance more rapidly in acquiring well-grounded theories of human behavior and of the effect of diverse institutional arrangements on behavior. Laboratory research will still need to be complemented by sound field studies to meet the criteria of external validity.

Implications for Policy

Using a broader theory of rationality leads to potentially different views of the state. If one sees individuals as helpless, then the state is the essential external authority that must solve social dilemmas for everyone. If, however, one assumes individuals can draw on heuristics and norms to solve some problems and create new structural arrangements to solve others, then the image of what a national government might do is somewhat different. There is a very considerable role for large-scale governments, including national defense, monetary policy, foreign policy, global trade policy, moderate redistribution, keeping internal peace when some groups organize to prey on others, provision of accurate information and of arenas for resolving conflicts with national implications, and other large-scale activities. But national governments are too small to govern the global commons and too big to handle smaller scale problems.

To achieve a complex, multitiered governance system is quite difficult. Many types of questions are raised. How do different kinds of institutions support or undermine norms of reciprocity both within hierarchies (Miller 1992) and among members of groups facing collective action problems (Frohlich and Oppenheimer 1970, Galjart 1992)? Field studies find that monitoring and graduated sanctions are close to universal in all robust common-pool resource institutions (E. Ostrom 1990). This tells us that without some external support of such institutions, it is unlikely that reciprocity *alone* completely solves the more challenging common-pool resource problems. Note that sanctions are graduated rather than initially severe. Our current theory of crime—based on a strict expected value theory—does not explain this. If people can learn reciprocity as the fundamental norm for organizing their lives, and if they agree to a set of rules contingent upon others following these rules, then graduated sanctions do something more than deter rule infractions.

Reciprocity norms can have a dark side. If punishment consists of escalating retribution, then groups who overcome social dilemmas may be limited to very tight circles of kin and friends, who cooperate only with one another, embedded in a matrix of hostile relationships with outsiders (R. Hardin 1995). This pattern can escalate into feuds, raids, and overt warfare (Boyd and Richerson 1992, Chagnon 1988, Elster 1985, Kollock 1993). Or tight circles of individuals who trust one another may discriminate against anyone of a different color, religion, or ethnicity. A focus on the return of favors for favors can also be the foundation for corruption. It is in everyone else's interest that some social

dilemmas are *not* resolved, such as those involved in monopolies and cartel formation, those that counter-vene basic moral standards and legal relationships, and those that restrict the opportunities of an open society and an expanding economy. Policies that provide alternative opportunities for those caught in dysfunctional networks are as important as those that stimulate and encourage positive networks (Dasgupta 1997).

Implications for Civic Education

Human history teaches us that autocratic governments often wage war on their own citizens as well as on those of other jurisdictions. Democracies are characterized by the processing of conflict among individuals and groups without resort to massive killings. Democracies are, however, themselves fragile institutions that are vulnerable to manipulation if citizens and officials are not vigilant (V. Ostrom 1997). For those who wish the twenty-first century to be one of peace, we need to translate our research findings on collective action into materials written for high school and undergraduate students. All too many of our textbooks focus exclusively on leaders and, worse, only national-level leaders. Students completing an introductory course on American government, or political science more generally, will not learn that they play an essential role in sustaining democracy. Citizen participation is presented as contacting leaders, organizing interest groups and parties, and voting. That citizens need additional skills and knowledge to resolve the social dilemmas they face is left unaddressed. Their moral decisions are not discussed. We are producing generations of cynical citizens with little trust in one another, much less in their governments. Given the central role of trust in solving social dilemmas, we may be creating the very conditions that undermine our own democratic ways of life. It is ordinary persons and citizens who craft and sustain the workability of the institutions of everyday life. We owe an obligation to the next generation to carry forward the best of our knowledge about how individuals solve the multiplicity of social dilemmas—large and small—that they face.

Convicting the Innocent: The Inferiority of Unanimous Jury Verdicts under Strategic Voting

TIMOTHY FEDDERSEN *Northwestern University*

WOLFGANG PESENDORFER *Princeton University*

It is often suggested that requiring juries to reach a unanimous verdict reduces the probability of convicting an innocent defendant while increasing the probability of acquitting a guilty defendant. We construct a model that demonstrates how strategic voting by jurors undermines this basic intuition. We show that the unanimity rule may lead to a high probability of both kinds of error and that the probability of convicting an innocent defendant may actually increase with the size of the jury. Finally, we demonstrate that a wide variety of voting rules, including simple majority rule, lead to much lower probabilities of both kinds of error.

According to Lord Devlin, "Trial by jury is not an instrument of getting at the truth; it is a process designed to make it as sure as possible that no innocent man is convicted" (Klaven and Zeisel 1966, 190). It is commonly thought that requiring juries to reach a unanimous verdict is exactly the mechanism that protects innocent defendants and that this protection comes at the cost of an increased probability of acquitting a guilty defendant. We construct a model that demonstrates how strategic voting by jurors undermines this basic intuition. The unanimity rule may lead to a high probability of both errors, and the probability of convicting an innocent defendant may actually increase with the size of the jury. We also demonstrate that the unanimity rule is an exceptionally bad rule. A wide variety of voting rules, including simple majority, lead to much lower probabilities of both errors.

There is a large literature on juries and jury decision making (e.g., Adler 1994, Klaven and Zeisel 1966, Levine 1992, and McCart 1964). A central argument for juries, formalized in the literature on Condorcet's jury theorem, is that a group will make a better decision than an individual (Klevorick et al. 1984, Ladha 1992, Miller 1986, and Young 1988). In Condorcet's jury theorem it is assumed that jurors have private information about the guilt or innocence of the defendant. This captures the idea that jurors interpret evidence differently because of their different life experiences and competencies. Since a jury vote aggregates their private information, juries make fewer errors than any individual.

Until recently, the literature has assumed that each juror will behave as if her vote alone determines the outcome. Several recent articles have demonstrated that such behavior by jurors is frequently irrational and that the combination of private information and common interests creates an incentive for jurors to vote strategically (Austen-Smith and Banks 1996; Feddersen and Pesendorfer 1996, 1997a, 1997b; McLen-

nan 1996; Myerson 1997; Wit 1996).¹ There is even experimental research that finds empirical support for the strategic voting hypothesis (Ladha, Miller and Oppenheimer 1996). The incentive to vote strategically arises because a juror's vote only matters when a vote is pivotal and because the information possessed by other jurors is relevant for a juror's decision. For example, under the unanimity rule, a vote is pivotal only if all the other jurors have voted to convict. The fact that all other jurors have voted to convict reveals additional information about the guilt of the defendant. Such information may overwhelm the juror's private assessment of the case and cause a juror otherwise inclined to vote for acquittal to vote for conviction instead.

In this article we examine the implications of strategic voting by jurors and demonstrate that basic intuitions about the consequences of requiring a unanimous vote may be dramatically wrong. We construct a model of jury decision making that incorporates private information and strategic voting. We show that the requirement of a unanimous verdict may actually result in a significantly higher probability of convicting an innocent defendant than would, for example, simple majority rule. We conclude with a few brief remarks on the implications of our results for jury reform.

THE MODEL

There are n jurors, $j = 1, \dots, n$, who must decide the fate of a defendant. The defendant is either guilty (G) or innocent (I).² We assume that G and I occur with equal probability.³

Jurors are uncertain whether the defendant is guilty or innocent. We assume that each juror gets a signal g or i that is correlated with the true state. Specifically, we assume that

$$\Pr(g|G) = \Pr(i|I) = p.$$

Timothy Feddersen is Assistant Professor of Managerial Economics and Decision Sciences, J.L. Kellogg Graduate School of Management, Northwestern University, Evanston, IL 60208-2009 (tfed@nwu.edu). Wolfgang Pesendorfer is Professor of Economics, Princeton University, Princeton, NJ 08544 (pesendor@phoenix.princeton.edu).

¹ Jurors have common interests to the extent that all prefer to convict a guilty defendant and acquit an innocent defendant.

² Feddersen and Pesendorfer (1997a, 1997b) generalize the simple two-state model to multiple states. Adding additional states will not fundamentally alter our results.

³ This assumption can be easily relaxed without significantly changing our results.

Hence, the parameter $p \in (.5, 1)$ is the probability that a juror receives the "correct" signal (g if the defendant is guilty, i if the defendant is innocent), and $1 - p$ is the probability that the juror receives the "incorrect" signal (i if the defendant is guilty, g if the defendant is innocent).⁴

We assume the signal is private information. Since jurors observe the same facts at the trial and engage in deliberations prior to taking the final vote, the assumption may seem inappropriate. Yet, there are several reasons the complete disclosure of private information through the deliberation process may not occur. For example, some jurors may have technical knowledge that is relevant for the decision but that cannot be fully communicated in the limited amount of time available. Furthermore, while all jurors agree that they prefer convicting the guilty and acquitting the innocent, each may have a different threshold of reasonable doubt.⁵ Even such minimal preference diversity may create incentives for jurors not to reveal their private information in deliberations. For example, a juror predisposed to convict may be reluctant to reveal her innocent signal lest another juror with a higher threshold who received a guilty signal vote to acquit. Since we do not model the effect of jury deliberations, determining that effect from a theoretical standpoint is beyond the scope of this article.

The jury reaches a decision by taking a simultaneous vote. Each juror must vote either to convict or to acquit. If the number of votes to convict is larger than or equal to $\hat{k}$, then the defendant is convicted; otherwise, the defendant is acquitted. The number $\hat{k}$ defines the voting rule used by the jury. Thus, if $\hat{k} = n$, then a unanimous verdict is required to convict; if $\hat{k} = (n + 1)/2$, then a conviction is obtained by a simple majority vote. There are two possible outcomes of the jury's vote: either the defendant is convicted (C) or acquitted (A).

Given the voting rule $\hat{k}$, juror j 's behavior can be described by the strategy $\sigma_j: \{g, i\} \rightarrow [0, 1]$, which maps the set of signals into a probability of voting to convict.

We assume all jurors have preferences, given by $u(A, I) = u(C, G) = 0$, $u(C, I) = -q$, and $u(A, G) = -(1 - q)$, where $q \in (0, 1)$. Thus, if a guilty defendant is convicted or an innocent defendant is acquitted, then each juror's payoff is zero. If an innocent defendant is convicted, then the juror's payoff is $-q$; if a guilty defendant is acquitted, then the juror's payoff is $-(1 - q)$. The parameter q exactly characterizes a juror's threshold of reasonable doubt. A juror who believes the defendant is guilty with probability higher than q will prefer the defendant to be convicted. The larger the value of q , the less concern jurors have

for acquitting a guilty defendant relative to convicting an innocent defendant. We assume that jurors employ the same standard of reasonable doubt, that is, q is identical for all jurors. This assumption is made for technical convenience. Below, we indicate how our results generalize to the case in which jurors' preferences are represented by different values of q . (See Feddersen and Pesendorfer 1996, 1997a, 1997b and Coughlan 1997 for examples of strategic voting under preference diversity.)

Let $\beta(k, n)$ denote the posterior probability that the defendant is guilty, conditional on observing n signals, k of which are guilty:

$$\beta(k, n) = \frac{p^k(1-p)^{n-k}}{p^k(1-p)^{n-k} + (1-p)^k p^{n-k}}.$$

If $\beta(k, n) > q$, then, given all the information available to the jury, the defendant is guilty beyond a reasonable doubt. Therefore, the optimal outcome from the jurors' point of view is to convict. Similarly, if $\beta(k, n) < q$, then the optimal outcome for the jurors is to acquit. We assume that there is a k^* with $n \geq k^* \geq 1$, such that

$$\beta(k^* - 1, n) < q < \beta(k^*, n).$$

This assumption implies, on the one hand, that if the jurors know they all have received the guilty signal, then they always want to convict the defendant. On the other hand, if the jurors believe they all have received an innocent signal, then they always want to acquit.

As a baseline for comparison we first consider nonstrategic voting. We say that a juror votes informatively if she votes guilty when she receives a guilty signal and innocent when she receives an innocent signal. If jurors vote informatively, then the unanimity rule ($\hat{k} = n$) leads to a lower probability of convicting an innocent defendant than would any other rule ($\hat{k} < n$). The probability an innocent defendant is convicted under the unanimity rule given informative voting is $(1 - p)^n$. It is easy to see that this probability is smaller than the probability of convicting an innocent defendant under any other rule.⁶ Under the unanimity rule, the probability a convicted defendant is guilty is given by

$$\frac{p^n}{p^n + (1 - p)^n}.$$

This probability converges to one as the size of the jury grows, that is, $n \rightarrow \infty$. Conversely, the probability of acquitting a guilty defendant is strictly higher under the unanimity rule than under any other rule.⁷

As has been shown in the literature cited above, informative voting does not typically constitute equi-

⁴ The assumption that the probability of receiving signal i in state I is identical to the probability of receiving signal g in state G can be relaxed without significantly changing our results.

⁵ Support for the hypothesis of differing thresholds of reasonable doubt can be found in Klaven and Ziesel (1966, chap. 14). They show that when the verdict the judge would have chosen differs from the verdict chosen by the jury, it is more frequently the case that the jury acquits when the judge would have convicted than the other way around.

⁶ If the rule requires $\hat{k}$ of n votes to be guilty, then under informative voting the probability of convicting an innocent defendant is $\sum_{j=\hat{k}}^n \binom{n}{j} (1-p)^j p^{n-j}$.

⁷ This probability is $1 - p^n$ under the unanimity rule, which is strictly larger than $\sum_{j=0}^{\hat{k}-1} \binom{n}{j} (1-p)^j p^{n-j}$, which is the corresponding probability for the rule that requires $\hat{k} < n$ guilty votes.

librium behavior. In the following we analyze Nash equilibria of the described voting game. This allows us to compare the performance of the various voting rules.

THE UNANIMITY RULE

In this section we examine Nash equilibria under the unanimity rule, that is, $\hat{k} = n$.

Consider the case in which $k^* = n$, that is, $\beta(n-1, n) \leq q < \beta(n, n)$. In this case informative voting is an equilibrium under the unanimity rule. To see this, suppose that all jurors vote to convict if and only if they receive the signal g . If a juror is pivotal and receives the signal i , then he knows that $n-1$ of n jurors received the signal g . Therefore, he believes that the defendant is guilty with probability $\beta(n-1, n) \leq q$, that is, not guilty beyond a reasonable doubt, and hence he (weakly) prefers that the defendant be acquitted. Thus, a vote to acquit is optimal. Conversely, if the juror receives the signal g , then he believes that the defendant is guilty with probability $\beta(n, n) > q$, and hence he prefers that the defendant be convicted.

Now consider the case in which

$$\beta(n-1, n) > q. \quad (1)$$

This condition says that if a juror could observe all the signals, and if $n-1$ of the n signals are g , then the juror prefers to convict the defendant. Note that, for any fixed q , there is an $\bar{n}$ such that condition 1 is true for any $n > \bar{n}$.⁸

Suppose that condition 1 is satisfied and a juror believes that the other jurors are voting informatively. A rational juror will condition her vote not only on her private information but also on what she believes others must know in the event her vote is pivotal. Under the unanimity rule a vote is pivotal only when all the other jurors have voted to convict. A juror who receives an innocent signal and believes that the other jurors are voting informatively *must* believe that the probability the defendant is guilty is exactly $\beta(n-1, n)$. But since $\beta(n-1, n) > q$, the juror will ignore her private signal and vote to convict. Therefore, if (1) holds, then informative voting cannot be a Nash equilibrium.

THE PROBABILITY A CONVICTED DEFENDANT IS INNOCENT

In contrast to the results under informative voting, strategic voting under the unanimity rule imposes a *lower* bound on the probability that a convicted defendant is innocent. Proposition 1 provides this bound for any Nash equilibrium and shows that the bound is independent of the size of the jury.

PROPOSITION 1. *Consider any Nash equilibrium in which the defendant is convicted with strictly positive proba-*

bility. Then the probability that a convicted defendant is innocent is bounded below by

$$\min \left\{ 1/2, \frac{1-q}{1+q \frac{2p-1}{(1-p)^2}} \right\}$$

Proof. See Appendix A.

Q.E.D.

It is straightforward to extend proposition 1 to the case in which jurors have different thresholds of reasonable doubt. If we let q denote the maximal threshold of reasonable doubt among the jurors, then the bound given in proposition 1 continues to hold in the more general case in which each juror has a different threshold, q_j , $j = 1, \dots, n$.

To understand the intuition behind proposition 1, it is useful to distinguish two cases. First consider the (trivial) case in which the defendant is always convicted. Then the probability that a convicted defendant is innocent is simply $1/2$, that is, the prior probability that the defendant is innocent.

Second, consider the case in which the defendant sometimes is acquitted. In this case at least one juror votes to acquit with strictly positive probability when he receives the signal i . A juror will only vote to acquit if the fact that a vote is pivotal is not overwhelming evidence of guilt. To put this formally, let piv_j denote the event that juror j 's vote is pivotal. Upon observing signal i , j can only vote to acquit in any Nash equilibrium if

$$\Pr(G|piv_j, i) \leq q.$$

In other words, the probability the defendant is guilty conditional on j 's vote being pivotal and on her private signal i must be less than or equal to her threshold of reasonable doubt q .

Now observe that the only difference between the event a vote is pivotal and the event the defendant is convicted is one vote. The most information that one additional vote can reveal occurs when a pivotal voter votes informatively. It follows that conditional on a conviction the defendant must be innocent with probability bounded strictly away from zero and that this lower bound is independent of the size of the jury. This outcome represents a stark contrast with the results under the assumption of informative voting, in which the fraction of convicted defendants who are innocent goes to zero as the size of the jury increases.

CONVICTING INNOCENT DEFENDANTS

In this section we explicitly compute an equilibrium under the unanimity rule. We then demonstrate that in this equilibrium innocent defendants are convicted with strictly positive probability even when the jury size is very large. This contrasts with the result under informative voting, in which the probability of convicting any defendant goes to zero as the size of the jury grows.

For the subsequent analysis we examine *symmetric*

⁸ To see this, observe that $\beta(n-1, n) = p^{n-1}(1-p)/(p^{n-1}(1-p) + (1-p)^{n-1}p) = 1/(1 + (1-p/p)^{n-1})$. Since $p > 1/2$, it follows that $\lim_{n \rightarrow \infty} \beta(n-1, n) = 1$.

Nash equilibria, in which all jurors who receive the same signal take the same (possibly mixed) action. We therefore drop the subscript identifying particular jurors from our notation and write $\sigma(s)$ to denote the probability a juror votes to convict upon observing signal s . A symmetric strategy profile is given by $(\sigma(i), \sigma(g))$.

Under any voting rule there is a Nash equilibrium in which all jurors vote the same way independent of their signal; for example, under the unanimity rule all jurors may vote to acquit independent of their private signal. Since no juror can influence the outcome, this is always an equilibrium.⁹

In the following we focus on profiles in which jurors change their vote as a function of their private information with positive probability. We call such profiles responsive. In order to formalize our definition of responsive profiles we first define

$$\gamma_G = \sigma(g)p + (1-p)\sigma(i)$$

as the probability that a juror votes to convict if the defendant is guilty and

$$\gamma_I = (1-p)\sigma(g) + p\sigma(i)$$

as the probability that a juror votes to convict if the defendant is innocent. We say that the profile $(\sigma(g), \sigma(i))$ is responsive if $\gamma_G \neq \gamma_I$.

If condition 1 holds, then informative voting is not an equilibrium, and any responsive symmetric equilibrium must be in mixed strategies. More precisely, each juror must both vote to convict and vote to acquit with positive probability whenever she receives a signal i , that is, $\sigma(i) > 0$. When the juror receives the signal g , she votes to convict with probability 1, that is, $\sigma(g) = 1$.¹⁰

For a mixed strategy profile to be an equilibrium, a juror who receives an innocent signal must be indifferent between voting to acquit and voting to convict. This occurs when, conditional on $n-1$ others voting guilty and the juror receiving signal i , the probability that the defendant is guilty is exactly equal to q . By Bayes's law we get the following equilibrium condition for the unanimity rule:

$$\frac{(1-p)(\gamma_G)^{n-1}}{(1-p)(\gamma_G)^{n-1} + p(\gamma_I)^{n-1}} = q. \quad (2)$$

Therefore,

⁹ Even when the unanimity rule is used the profile in which all jurors vote to acquit regardless of their signal is a symmetric equilibrium. Ruling out weakly dominated strategies does not eliminate this equilibrium.

¹⁰ It is straightforward to verify that there are no mixed strategy equilibria in which jurors who receive signal g vote with positive probability to acquit. Support for such a mixed strategy equilibrium requires that those who receive a guilty signal are indifferent between convicting and acquitting, given their vote is pivotal. In such a case those who receive an innocent signal strictly prefer to acquit. But then the only jurors who vote to convict are those who receive the guilty signal. Under the unanimity rule, a vote is only pivotal when all others vote guilty. Thus, such a strategy profile is not a Nash equilibrium, by the same argument used to show that informative voting is not an equilibrium.

$$\sigma(i) = \frac{\left(\frac{(1-q)(1-p)}{qp}\right)^{1/(n-1)} p - (1-p)}{p - \left(\frac{(1-q)(1-p)}{qp}\right)^{1/(n-1)} (1-p)}. \quad (3)$$

Since $\sigma(i)$ is a mixed strategy, it must be that $\sigma(i) \leq 1$. Furthermore, in a responsive equilibrium it must be the case that $\sigma(i) < 1$; otherwise, each juror votes to convict with probability one irrespective of the signal. Examining equation 3 we see that $\sigma(i) < 1$ as long as $q > 1-p$. If $q \leq 1-p$, then there does not exist a responsive equilibrium. Instead, there is an equilibrium where $\sigma(i) = 1$, which implies that the probability of convicting an innocent defendant is one, and the probability of acquitting a guilty defendant is zero.¹¹

To understand why there cannot be a responsive equilibrium if $q < 1-p$, note that in equilibrium a guilty vote of some other juror can never be information in favor of the innocence of the defendant. If a juror receives no information from being pivotal, then he believes that the defendant is guilty with probability $1-p$ when he receives the signal i . Hence, conditional on his vote being pivotal, each juror must believe the defendant to be guilty with probability at least $1-p$, and each juror must vote to convict even if he receives the signal i .

Using equation 3 it is straightforward to compute the probability of making each type of error in equilibrium. When $q \geq 1-p$, the probability that an innocent defendant is convicted is given by

$$l_I(p, q, n) = (\gamma_I)^n = \left(\frac{(2p-1) \left(\frac{(1-q)(1-p)}{qp} \right)^{1/(n-1)}}{p - (1-p) \left(\frac{(1-q)(1-p)}{qp} \right)^{1/(n-1)}} \right)^n,$$

and the probability of acquitting a guilty defendant is

$$l_G(p, q, n) = 1 - (\gamma_G)^n = 1 - \left(\frac{(2p-1)}{p - (1-p) \left(\frac{(1-q)(1-p)}{qp} \right)^{1/(n-1)}} \right)^n.$$

Proposition 2 summarizes our findings in this section and demonstrates that the probability of convicting an innocent defendant stays bounded away from zero for all n . Similarly, the probability of acquitting a guilty defendant also stays bounded away from zero.

PROPOSITION 2. Assume condition 1 holds and $q > 1-p$. The strategy given by equation 3 is the unique responsive symmetric equilibrium for the unanimity rule. Moreover, $\sigma(i) \rightarrow 1$ as $n \rightarrow \infty$, and

¹¹ Clearly, there also exist equilibria where the defendant is never convicted. For example, if all jurors vote to acquit independent of their signal, then we have a Nash equilibrium, since no juror can influence the outcome.

FIGURE 1. The Probability an Innocent Defendant Is Convicted as a Function of Jury Size

$$\lim_{n \rightarrow \infty} l_I(p, q, n) = \left(\frac{(1-q)(1-p)}{qp} \right)^{p/(2p-1)},$$

$$\lim_{n \rightarrow \infty} l_G(p, q, n) = 1 - \left(\frac{(1-q)(1-p)}{qp} \right)^{1-p/(2p-1)}.$$

If $q \leq 1 - p$, then there is no responsive equilibrium. In this case $\sigma(i) = 1$ is an equilibrium, and $l_I(p, q, n) = 1$, $l_G(p, q, n) = 0$.

Proof. For $q > 1 - p$ we demonstrated in the text above that the unique responsive voting equilibrium under the unanimity rule is given by equation 3. In Appendix A we show that

$$\begin{aligned} & \lim_{n \rightarrow \infty} l_I(p, q, n) \\ &= \lim_{n \rightarrow \infty} \left(\frac{(2p-1) \left(\frac{(1-q)(1-p)}{qp} \right)^{1/(n-1)}}{p - (1-p) \left(\frac{(1-q)(1-p)}{qp} \right)^{1/(n-1)}} \right)^n \\ &= \left(\frac{(1-q)(1-p)}{qp} \right)^{p/(2p-1)}. \end{aligned}$$

The proof that $\lim_{n \rightarrow \infty} l_G(p, q, n) = 1 - ((1-q)(1-p)/qp)^{(1-p)/(2p-1)}$ is analogous.

If $q \geq 1 - p$, then the argument given in the text shows that there is no responsive equilibrium. *Q.E.D.*

Proposition 2 also implies that the probability of a guilty defendant being convicted ($1 - l_G$) is bounded away from zero for all n . This is again in contrast to the

case of informative voting, in which the probability of conviction converges to zero as $n \rightarrow 0$, independent of whether the defendant is guilty or innocent. Thus, a second implication of strategic voting is that the probability of a guilty verdict may be much larger than under informative voting.

To provide an intuition for proposition 2, first observe that equation 3 implies $\sigma(i) \rightarrow 1$ as $n \rightarrow \infty$. As a consequence, γ_G (the probability that a juror votes to convict if the defendant is guilty) and γ_I (the probability that a juror votes to convict if the defendant is innocent) both converge to one. This is not enough to show that the probability of convicting an innocent defendant, $(\gamma_I)^n$, stays bounded away from zero. In Appendix A we demonstrate that for large n , γ_I can be approximated by

$$1 + \frac{1}{n-1} \left(\frac{p}{2p-1} \ln f \right),$$

where $f = (1-q)(1-p)/qp$, and hence $(\gamma_I)^n$ converges to $f^{p/(2p-1)}$, which is the bound given in proposition 2.¹²

The convergence to the bounds given in proposition 2 is fast, and hence the limit formula allows us to approximate the probabilities of each kind of error even for small juries. Figure 1 illustrates the convergence of $l_I(p, q, n)$ for the values $p = 0.7$, $q = 0.5$. The figure is startling for several reasons. First, the limit probability of convicting an innocent defendant is quite large—22%. Second, when there are only 12 jurors the probability of convicting an innocent is 21%.

¹² Recall that $e^x = \lim_{n \rightarrow \infty} (1 + x/n)^n$.

FIGURE 2. The Probability a Guilty Defendant Is Acquitted as a Function of Jury Size

There is a difference of only 1% between the probability of convicting an innocent defendant with a jury size of $n \geq 12$ and the limit probability. Third, the probability of convicting an innocent defendant *increases* with the size of the jury.

Figure 2 shows the probability of acquitting a guilty defendant for the values $p = 0.7$, $q = 0.5$. The limit probability of acquitting a guilty defendant is 47%. Once again, the limit probability is a very good estimate of the actual probability of this type of mistake, even for small juries. Note that the probability of acquitting a guilty defendant actually *decreases* with the size of the jury.

Figure 3 shows the limit errors $l_I(p, q) = \lim_{n \rightarrow \infty} l_I(p, q, n)$ and $l_G(p, q) = \lim_{n \rightarrow \infty} l_G(p, q, n)$ for the value $p = 0.7$ as a function of q . The figure demonstrates that for large juries the probability of convicting an innocent decreases in q , while the probability of acquitting a guilty defendant increases in q . Thus, the unanimity rule does a poor job of protecting innocent defendants from unreasonable juries. Yet, if the jury is responsible (e.g., $q = .9$), the innocent defendant is protected at the cost of a high probability of acquitting the guilty. In the next section we show that the unanimity rule is a uniquely bad voting rule in terms of the probabilities of both kinds of error it induces.

Using the equilibrium strategies calculated in this section, we may also compute the probability that a convicted defendant is innocent and compare it to the bound given in proposition 1. A straightforward calculation demonstrates that

$$\lim_{n \rightarrow \infty} \Pr(G|C) = \frac{1-q}{1+q} \frac{2p-1}{1-p} > \frac{1-q}{1+q} \frac{2p-1}{(1-p)^2},$$

where the right-hand side of the above inequality is the bound given in proposition 1.

NONUNANIMOUS RULES

We now analyze the probability of making the wrong decision under nonunanimous voting rules.¹³ Suppose $\hat{k} = \alpha n$ for some α with $0 < \alpha < 1$, and assume that αn is an integer. Thus, a defendant will be convicted if and only if at least an α -fraction of the jury votes to convict. For a fixed α , consider a sequence of symmetric responsive equilibria corresponding to an increasing jury size. In the following proposition we show that as $n \rightarrow \infty$ the probability of making either of the two kinds of error converges to zero.

PROPOSITION 3. Fix any α with $0 < \alpha < 1$. (1) There is a n' such that for $n > n'$ there is a symmetric responsive equilibrium. (2) For any sequence of symmetric responsive equilibria the probability of convicting an innocent defendant and the probability of acquitting a guilty defendant both converge to zero.

Proof. See Appendix B.

Q.E.D.

¹³ See Appendix B for a computation of the (unique) symmetric responsive equilibrium for general $\hat{k}$.

FIGURE 3. Limit Error Probabilities as a Function of the Threshold of Reasonable Doubt

Proposition 3 shows that for any $\alpha \in (0, 1)$ the probability of convicting an innocent defendant and the probability of acquitting a guilty defendant both converge to zero as the jury grows large.¹⁴ This is in sharp contrast to the results of propositions 1 and 2, which showed that both types of mistakes stay bounded away from zero for the unanimity rule.

To provide an intuition for proposition 3, recall that γ_G is the probability a juror votes to convict if the defendant is guilty and γ_I is the corresponding probability if the defendant is innocent. As we noted above, in any responsive profile it must be the case that $1 > \gamma_G > \gamma_I > 0$. Suppose the actual fraction of guilty votes is a . Then probability that the defendant is guilty is given by

$$\frac{(\gamma_G)^{an}(1 - \gamma_G)^{(1-a)n}}{(\gamma_G)^{an}(1 - \gamma_G)^{(1-a)n} + (\gamma_I)^{an}(1 - \gamma_I)^{(1-a)n}}.$$

It follows that if

$$\frac{(\gamma_I)^a(1 - \gamma_I)^{1-a}}{(\gamma_G)^a(1 - \gamma_G)^{1-a}} \neq 1,$$

then for large n the defendant is either guilty with probability close to one (if the above fraction is less than one) or innocent with probability close to one (if the above fraction is greater than one).

For any responsive profile there is a unique a^* , such that

$$\frac{(\gamma_I)^{a^*}(1 - \gamma_I)^{1-a^*}}{(\gamma_G)^{a^*}(1 - \gamma_G)^{1-a^*}} = 1,$$

and $\gamma_G > a^* > \gamma_I$.¹⁵ If the actual fraction of guilty votes is $a < a^*$, then for large n the defendant is innocent with probability close to one; if $a > a^*$, then the defendant is guilty with probability close to one.

In any responsive equilibrium it must be the case that the event a vote is pivotal, that is, an α fraction votes to convict, is not overwhelming evidence of either guilt or innocence.¹⁶ This in turn implies that the a^* implied by a responsive equilibrium must be arbitrarily close to α if n is sufficiently large.

Now recall that a responsive equilibrium may take two possible forms. One is that jurors vote to acquit when they observe signal i and randomize when they observe signal g (i.e., $\sigma(i) = 0$ and $0 \leq \sigma(g) \leq 1$). The other is that jurors vote to convict when they observe signal g and randomize when they observe signal i (i.e., $0 \leq \sigma(i) \leq 1$ and $\sigma(g) = 1$). Figure 4 depicts γ_I , γ_G , and a^* as a function of the strategy profile for $p = 0.7$. It is convenient to represent the strategy by the variable $x \in [0, 2]$. For $x \leq 1$ the strategy is $\sigma(i) = 0$, $\sigma(g) = x$; for $x \geq 1$ the strategy is $\sigma(g) = 1$, $\sigma(i) = x - 1$.

Figure 4 allows us to find the unique symmetric responsive equilibrium for large juries as a function of the voting rule α . Suppose, for example, that α is as indicated in the figure. Since a^* in a large jury is close to α , it must be that the equilibrium strategy profile is

¹⁴ Proposition 3 holds in much more general environments. Feddersen and Pesendorfer (1997a) prove the analogous result for an environment that includes preference diversity and a much broader range of information environments. Myerson (n.d.) proves a similar result for the case of simple majority rule.

¹⁵ It is easy to see that $(\gamma_I)^{a^*}(1 - \gamma_I)^{1-a^*}/(\gamma_G)^{a^*}(1 - \gamma_G)^{1-a^*} = 1$ implies $a^* = (\ln(1 - \gamma_G) - \ln(1 - \gamma_I))/(\ln \gamma_I - \ln \gamma_G + \ln(1 - \gamma_G) - \ln(1 - \gamma_I))$.

¹⁶ Formally, it must be the case in any responsive equilibrium that $\Pr(G|piv, g) \geq q \geq \Pr(G|piv, i)$.

FIGURE 4. Limit Equilibrium Strategies as a Function of the Voting Rule

Note: Calculations assume $p = .7$ and $0 < q < 1$.

The actual functions shown are:

$$\gamma_G(x) = \begin{cases} .7 + .3(x-1) & \text{if } x \geq 1 \\ .7x & \text{if } x < 1 \end{cases}$$

$$\gamma_I(x) = \begin{cases} .3 + .7(x-1) & \text{if } x \geq 1 \\ .3x & \text{if } x < 1 \end{cases}$$

$$a^*(x) = \frac{\ln(1 - \gamma_G(x)) - \ln(1 - \gamma_I(x))}{\ln \gamma_I(x) - \ln \gamma_G(x) + \ln(1 - \gamma_G(x)) - \ln(1 - \gamma_I(x))}$$

close to $\bar{x}$ (which corresponds to $\sigma(g) = 1$ and $\sigma(i) = \bar{x} - 1$). Figure 4 also illustrates why large juries rarely make mistakes when $0 < \alpha < 1$. Observe that for large n the equilibrium pair (γ_G, γ_I) is very close to $(\bar{\gamma}_G, \bar{\gamma}_I)$, and $\bar{\gamma}_G > \alpha > \bar{\gamma}_I$. Furthermore, as the size of the jury grows the actual vote share converges in probability to the expected vote share. Therefore, when the defendant is guilty, the actual fraction of guilty votes will be close to $\bar{\gamma}_G$, with probability close to one, and the defendant will be convicted. Conversely, when the defendant is innocent, the actual fraction of guilty votes will be close to $\bar{\gamma}_I$, with probability close to one, and the defendant will be acquitted. By contrast, consider the unanimity rule ($\alpha = 1$). In order for a^* to be close to one it is necessary that both γ_G and γ_I be close to one, and therefore the above argument fails.

Propositions 1, 2, and 3 imply that the unanimity rule is *uniquely bad* for large juries. A second conclusion that can be drawn from proposition 3 is that under nonunanimous rules the size of a jury is more important in determining the probability of making a mistake in the verdict than is the voting rule. Therefore, if the probability an innocent defendant is convicted is considered to be too large under a nonunanimous rule, then the remedy is not to change the rule but to increase the size of the jury.

In the next section we provide an example which

suggests that convergence is fast, and hence our convergence results are indeed relevant for relatively small juries.

EXAMPLE

We consider a 12-person jury, $n = 12$. We set the parameter for reasonable doubt at $q = 0.9$, that is, jurors need to believe that the defendant is guilty with probability 0.9 in order to convict. We assume that $p = 0.8$, that is, the probability of receiving a guilty signal if the defendant is guilty is 0.8.¹⁷

The probability of convicting an innocent defendant, $l_I(\hat{k})$, is given by

$$l_I(\hat{k}) = \sum_{j=\hat{k}}^n \binom{n}{j} (\gamma_I(\hat{k}))^j (1 - \gamma_I(\hat{k}))^{n-j},$$

where

$$\gamma_I(\hat{k}) = (1 - p)\sigma(g)(\hat{k}) + p\sigma(i)(\hat{k})$$

is the probability that any juror votes for conviction if the defendant is innocent.

¹⁷ It follows that a jury of one would never convict, since $\beta(1, 1) = .8 < .9 = q$.

TABLE 1. An Example of Error Probabilities and Equilibrium Strategies in a 12-Person Jury When $\hat{k} \geq 7$

Voting Rule $\hat{k}$	7	8	9	10	11	12
I_I	.004	.0011	.0025	.0045	.0066	.0069
I_G	.019	.0660	.1350	.2450	.4200	.6540
$\sigma(i)$	0	.0230	.1430	.2770	.4230	.5750

Note: We assume that $p = .8$ and $q = .9$. Note that I_I is the probability an innocent defendant is convicted and I_G is the probability a guilty defendant is acquitted. The full equilibrium profile is $\sigma(g) = 1$ and $\sigma(i)$ as specified in the table.

Similarly, the probability of acquitting a guilty defendant, $I_G(\hat{k})$, is given by

$$I_G(\hat{k}) = 1 - \sum_{j=\hat{k}}^n \binom{n}{j} (\gamma_G(\hat{k}))^j (1 - \gamma_G(\hat{k}))^{n-j},$$

where

$$\gamma_G(\hat{k}) = p\sigma(g)(\hat{k}) + (1 - p)\sigma(i)(\hat{k}).$$

Table 1 gives the probability of making mistakes as a function of the rule $\hat{k}$ when $\hat{k} \geq 7$. At $\hat{k} = 7$, informative voting is the equilibrium. Thus, every juror who receives a signal g votes to convict, and every juror who receives a signal i votes to acquit. For all $\hat{k} > 7$, the jurors who receive the signal i mix between voting to convict and voting to acquit, while those who receive signal g always vote to convict. As the table shows, the unanimity rule has the highest probability of convicting an innocent defendant when $\hat{k} \geq 7$. In addition, all rules with $\hat{k} \geq 7$ have the property that they lead to a lower probability of acquitting a guilty defendant than the unanimity rule.

Table 2 shows the probability of making an error when $\hat{k} < 7$. For $\hat{k} \leq 6$ the equilibrium strategies are such that a juror who receives the signal i always votes to acquit, while a juror who receives the signal g mixes between voting to convict and voting to acquit. For $\hat{k} = 1$ the defendant is never convicted, that is, $I_G = 1$. To see why this is the case, suppose that no juror ever votes to convict. In this case, each juror is always pivotal, since one guilty vote is enough for a conviction. But this implies that the only information the juror has conditional on his vote being pivotal is his own signal. Conditional on having received signal g , the juror believes that the defendant is guilty with probability

TABLE 2. Error Probabilities and Equilibrium Strategies in a 12-Person Jury When $\hat{k} < 7$

Voting Rule	1	2	3	4	5	6
I_I	0	.0159	.034	.027	.019	.010
I_G	1	.780	.410	.210	.095	.036
$\sigma(g)$	0	.091	.306	.512	.704	.879

Note: The full equilibrium profile is $\sigma(i) = 0$ and $\sigma(g)$ as specified in the table.

0.8. Since the reasonable doubt threshold is 0.9, each juror votes to acquit.

The probability of convicting an innocent defendant reaches a maximum at $\hat{k} = 3$, while the probability of acquitting a guilty defendant is monotonically decreasing for $\hat{k} \leq 6$, and the probability of convicting an innocent defendant is zero at $\hat{k} = 1$.¹⁸

CONCLUSION

We demonstrated that strategic behavior dramatically alters our intuitions about the consequences of jury voting rules. When jurors vote strategically, the unanimity rule results in a strictly positive probability both of acquitting the guilty and convicting the innocent, even for very large juries. Increasing the size of the jury does not help and actually may increase the probability of convicting an innocent defendant. Finally, in large juries the unanimity rule is inferior to a variety of other rules.

It is appropriate to conclude with a note of caution. Jury reform is not an abstract proposition. A group called Citizens for a Safer California proposed the Public Safety Protection Act of 1996. It would eliminate the unanimous verdict in all but capital murder cases and replace it with a rule requiring only 10 of 12 jurors to convict.¹⁹ Our results lend some support to such an initiative. Yet, retaining the unanimity rule in capital cases is exactly the wrong thing to do. Presumably, the motive for retaining it is to protect against the terrible consequences of convicting an innocent. Our results suggest that it would be better to combine a supermajority rule with a larger jury for cases in which it is desirable to reduce the probability of convicting an innocent.

More important, our results depend on the assumptions of private information and strategic voting. As noted above, there is some experimental evidence that strategic voting will occur in the presence of private information and common values (Ladha, Miller, and Oppenheimer 1996). There is also some empirical support for the assumption that deliberations fail to eliminate private information, and hence jurors have private information at the final voting stage. Selvin and Picus (1987, 24) conducted interviews with jurors after the verdict and found significant differences in their information about the facts of the trial. The degree to which strategic voting and private information characterize actual juries is ultimately an empirical question and beyond the scope of this article.

The final caveat is that criminal trials in the United States have at least three possible outcomes: convic-

¹⁸ In this case, conditional on a vote being pivotal, a juror knows that all other jurors must have voted to acquit. In equilibrium this can never be information in favor of the guilt of the defendant. If the juror receives a guilty signal, he therefore believes the defendant to be guilty with probability at most p . Since $p < q$, the juror votes to acquit.

¹⁹ The group claims that a "broad coalition of crime victims, law enforcement and concerned citizens" support the proposed legislation. It also claims that an independent poll shows 71% of Californians support 10:2 jury verdicts. This information was downloaded from the Internet at <http://taren.ns.net/cdaa.htm>, October 1996.

tion, acquittal, or mistrial. A unanimous vote is required for either conviction or acquittal. The effect of strategic voting and private information in this setting has been examined by Coughlan (1997). He shows that requiring juries to reach a unanimous verdict minimizes the probability of both types of error when a hung jury always results in a retrial. As we showed above, however, the probability of errors can be made arbitrarily small when a single jury verdict is decisive by using a nonunanimous rule and increasing the size of the jury. Hence, if retrying the defendant is very costly, unanimity remains an inferior rule.

APPENDIX A

Proof of Proposition 1

Let $\sigma = \{(\sigma_j(i), \sigma_j(g))\}_{j=1}^n$ be a Nash equilibrium profile. There are two types of equilibria in which the defendant is convicted with positive probability. The first type occurs when $1 - p > q$ and all jurors vote to convict independent of their private signal. In this case for any juror j it follows that $\Pr(G|piv_j, i) = 1 - p \geq q$. The defendant is always convicted, and the probability that a convicted defendant is innocent is equal to $1/2$.

The second type of equilibrium occurs when there is some juror who votes to acquit with positive probability. Suppose j upon receiving signal s votes to acquit with positive probability, that is, $\sigma_j(s) < 1$. Also note that since the defendant is convicted with strictly positive probability, it follows that each juror is pivotal with strictly positive probability. Since $\sigma_j(s) < 1$, it follows that

$$\begin{aligned} q &\geq \Pr(G|piv_j, s) \\ &= \frac{\Pr(piv_j|G) \Pr(s|G)(1/2)}{\Pr(piv_j|G) \Pr(s|G)(1/2) + \Pr(piv_j|I) \Pr(s|I)(1/2)} \\ &= \frac{\Pr(piv_j|G)}{\Pr(piv_j|G) + \Pr(piv_j|I)} \Pr(s|G) \\ &= \frac{\left[\frac{\Pr(piv_j|G)}{\Pr(piv_j|G) + \Pr(piv_j|I)} \Pr(s|G) \right]}{\left[\frac{\Pr(piv_j|G)}{\Pr(piv_j|G) + \Pr(piv_j|I)} \Pr(s|G) \right] + \left[\frac{\Pr(piv_j|I)}{\Pr(piv_j|G) + \Pr(piv_j|I)} \Pr(s|I) \right]} \\ &= \frac{\Pr(G|piv_j) \Pr(s|G)}{\Pr(G|piv_j) \Pr(s|G) + (1 - \Pr(G|piv_j)) \Pr(s|I)}. \end{aligned}$$

Thus,

$$\Pr(G|piv_j) \leq \frac{qp}{(1-q)(1-p) + qp}. \quad (4)$$

Recall that C denotes the event that the defendant is convicted, and let $\gamma_{Gj} = p\sigma_j(g) + (1-p)\sigma_j(i)$ and $\gamma_{Ij} = p\sigma_j(i) + (1-p)\sigma_j(g)$. Since the defendant is convicted with strictly positive probability, it follows that $\sigma_j(g) > 0$ or $\sigma_j(i) > 0$; therefore, both $\gamma_{Gj} > 0$ and $\gamma_{Ij} > 0$. Hence we may write

$$\Pr(G|C) = \frac{\Pr(G|piv_j)\gamma_{Gj}}{\Pr(G|piv_j)\gamma_{Gj} + (1 - \Pr(G|piv_j))\gamma_{Ij}}.$$

Since

$$\frac{\gamma_{Ij}}{\gamma_{Gj}} \geq \frac{1-p}{p},$$

it follows from 4 and some algebra that

$$\Pr(G|C) \leq \frac{qp^2}{1 - 2p + p^2 - q + 2qp},$$

which gives the result

$$\Pr(I|C) = 1 - \Pr(G|C) \geq \frac{(1-p)^2(1-q)}{1 - 2p + p^2 - q + 2qp}. \quad Q.E.D.$$

Proof of Proposition 2

We now show that

$$\begin{aligned} \lim_{n \rightarrow \infty} \left(\frac{1}{\frac{p}{2p-1} \left(\frac{(1-q)(1-p)}{qp} \right)^{-1/(n-1)} - \frac{(1-p)}{2p-1}} \right)^n \\ = \left(\frac{(1-q)(1-p)}{qp} \right)^{p/(2p-1)}. \end{aligned}$$

Let

$$h = \frac{p}{2p-1} \left(\frac{(1-q)(1-p)}{qp} \right)^{-1/(n-1)} - \frac{(1-p)}{2p-1}.$$

Suppose $\infty > \lim_{n \rightarrow \infty} h^n > 0$, then $\lim_{n \rightarrow \infty} h^{-n} = 1/\lim_{n \rightarrow \infty} h^n$. Now let

$$f = \frac{(1-q)(1-p)}{qp}.$$

We use the following facts:

$$\lim_{n \rightarrow \infty} \left(1 + \frac{z}{n} \right)^n = e^z, \quad (5)$$

and, given $f \in (0, 1)$,

$$1 + \frac{-1}{n} \ln f \geq f^{-1/n-1} \geq 1 + \frac{-1}{n-1} \ln f. \quad (6)$$

From 6 we know

$$h \geq \frac{p}{2p-1} \left(1 + \frac{-1}{n-1} \ln f \right) - \frac{(1-p)}{2p-1}.$$

Some simple algebra shows that

$$\begin{aligned} \frac{p}{2p-1} \left(1 + \frac{-1}{n-1} \ln f \right) - \frac{(1-p)}{2p-1} &= 1 \\ &+ \frac{1}{n-1} \frac{-p}{2p-1} \ln f. \end{aligned}$$

Thus,

$$\lim_{n \rightarrow \infty} (h)^n \geq \lim_{n \rightarrow \infty} \left(1 + \frac{1}{n-1} \frac{-p}{2p-1} \ln f \right)^n,$$

and from 5 we get

$$\lim_{n \rightarrow \infty} \left(1 + \frac{1}{n-1} \frac{-p}{2p-1} \ln f \right)^n = \left(\frac{(1-q)(1-p)}{qp} \right)^{-p/(2p-1)}.$$

We can make an identical argument using 6 to establish that

$$\lim_{n \rightarrow \infty} (h)^n \leq \lim_{n \rightarrow \infty} \left(1 + \frac{1}{n} \frac{-p}{2p-1} \ln f \right)^n$$

$$= \left(\frac{(1-q)(1-p)}{qp} \right)^{-p/(2p-1)} \quad Q.E.D.$$

APPENDIX B

First, we compute the equilibrium for a general $\hat{k}$. Denote the probability that a juror votes to convict in state I as

$$\gamma_I = (1-p)\sigma(g) + p\sigma(i)$$

and the probability that a juror votes to convict in state G as

$$\gamma_G = p\sigma(g) + (1-p)\sigma(i).$$

When $1 > \sigma(i)$, we must have

$$\frac{1}{1 + \frac{p(\gamma_I)^{\hat{k}-1}(1-\gamma_I)^{n-\hat{k}}}{(1-p)(\gamma_G)^{\hat{k}-1}(1-\gamma_G)^{n-\hat{k}}}} \leq q, \quad (7)$$

with equality holding if $1 > \sigma(i) > 0$. Similarly, when $\sigma(g) > 0$ it must be true that

$$\frac{1}{1 + \frac{(1-p)(\gamma_I)^{\hat{k}-1}(1-\gamma_I)^{n-\hat{k}}}{p(\gamma_G)^{\hat{k}-1}(1-\gamma_G)^{n-\hat{k}}}} \geq q, \quad (8)$$

with equality holding if $1 > \sigma(g) > 0$.

Second, we show that $1 > \sigma(g) > 0$ implies $\sigma(i) = 0$ (an identical exercise shows that $1 > \sigma(i) > 0$ implies $\sigma(g) = 1$). Suppose $1 > \sigma(g) > 0$; 8 then implies

$$\frac{(1-q)p}{q(1-p)} = \frac{(\gamma_I)^{\hat{k}-1}(1-\gamma_I)^{n-\hat{k}}}{(\gamma_G)^{\hat{k}-1}(1-\gamma_G)^{n-\hat{k}}}.$$

Since $p > 1/2$ we can rewrite 7 as

$$\frac{1}{1 + \frac{(1-q)}{q} \left(\frac{p}{1-p} \right)^2} = q \frac{p^2 - (2p-1)}{p^2 - q(2p-1)} < q,$$

which implies $\sigma(i) = 0$.

Thus, in any responsive equilibrium we must have either $\sigma(i) = 0$ and $\sigma(g) > 0$ or $\sigma(i) < 1$ and $\sigma(g) = 1$. If

$$\frac{(1-p)(p)^{\hat{k}-1}(1-p)^{n-\hat{k}}}{p(1-p)^{\hat{k}-1}p^{n-\hat{k}} + (1-p)p^{\hat{k}-1}(1-p)^{n-\hat{k}}}$$

$$= \frac{1}{1 + \frac{p(p)^{\hat{k}-1}(1-p)^{n-\hat{k}}}{(1-p)(p)^{\hat{k}-1}(1-p)^{n-\hat{k}}}} \leq q \quad (9)$$

and

$$\frac{(p)^{\hat{k}}(1-p)^{n-\hat{k}}}{(1-p)^{\hat{k}}p^{n-\hat{k}} + p^{\hat{k}}(1-p)^{n-\hat{k}}}$$

$$= \frac{1}{1 + \frac{(1-p)(p)^{\hat{k}-1}(1-p)^{n-\hat{k}}}{p(p)^{\hat{k}-1}(1-p)^{n-\hat{k}}}} \geq q, \quad (10)$$

then the unique responsive voting equilibrium is $\sigma(i) = 0$ and $\sigma(g) = 1$. (Recall that a voting equilibrium is a symmetric Nash equilibrium.)

To see why this is the unique responsive voting equilibrium, observe that the left-hand side of 7 is strictly decreasing in $\sigma(i)$. Together with 9 this implies that whenever $\sigma(i) > 0$ (and $\sigma(g) = 1$) every juror has a strict incentive to vote to acquit. Similarly, the left-hand side of 8 is strictly decreasing in $\sigma(g)$. This together with 10 implies that whenever $\sigma(g) < 1$ (and $\sigma(i) = 0$) every juror has a strict incentive to vote to convict.

If either 9 or 10 does not hold, then there are two cases to consider.

Case 1

Suppose

$$\frac{(p)^{\hat{k}}(1-p)^{n-\hat{k}}}{(1-p)^{\hat{k}}p^{n-\hat{k}} + p^{\hat{k}}(1-p)^{n-\hat{k}}} < q.$$

Then $\sigma(i) = 0$ is the equilibrium, and the equilibrium condition for $\sigma(g)$ is defined by 8 with equality holding. This yields

$$\frac{1}{1 + \frac{(1-p)(\gamma_I)^{\hat{k}-1}(1-\gamma_I)^{n-\hat{k}}}{p(\gamma_G)^{\hat{k}-1}(1-\gamma_G)^{n-\hat{k}}}} = q,$$

which we can rewrite as

$$\frac{(1-q)p}{q(1-p)} = \frac{(\gamma_I)^{\hat{k}-1}(1-\gamma_I)^{n-\hat{k}}}{(\gamma_G)^{\hat{k}-1}(1-\gamma_G)^{n-\hat{k}}}$$

$$= \frac{((1-p)\sigma)^{k-1}(1-(1-p)\sigma)^{n-k}}{(p\sigma)^{k-1}(1-p\sigma)^{n-k}}$$

$$= \left(\frac{1-p}{p} \right)^{k-1} \left(\frac{1-(1-p)\sigma}{1-p\sigma} \right)^{n-k}.$$

Therefore, we get

$$\frac{(1-q)}{q} \left(\frac{p}{1-p} \right)^k = \left(\frac{1-(1-p)\sigma}{1-p\sigma} \right)^{n-k}$$

$$\frac{(1-\sigma+p\sigma)}{(1-p\sigma)} = \left(\frac{(1-q)}{q} \left(\frac{p}{1-p} \right)^k \right)^{1/(n-k)}.$$

This yields

$$\sigma(g) = \frac{h-1}{p(h+1)-1},$$

where

$$h = \left(\frac{(1-q)}{q} \left(\frac{p}{1-p} \right)^k \right)^{1/(n-k)}.$$

Clearly, since $\sigma(g)$ is the unique solution of 8 in this case, there is a unique responsive voting equilibrium in this case.

Case 2

Suppose

$$\frac{(1-p)(p)^{\hat{k}-1}(1-p)^{n-\hat{k}}}{p(1-p)^{\hat{k}-1}p^{n-\hat{k}} + (1-p)p^{\hat{k}-1}(1-p)^{n-\hat{k}}} > q.$$

In this case $\sigma(g) = 1$, and the equilibrium condition is given by:

$$\frac{(1-p)(\gamma_G)^{\hat{k}-1}(1-\gamma_G)^{n-\hat{k}}}{p(\gamma_I)^{\hat{k}-1}(1-\gamma_I)^{n-\hat{k}} + (1-p)(\gamma_G)^{\hat{k}-1}(1-\gamma_G)^{n-\hat{k}}} \leq q,$$

with equality holding whenever $\sigma(i) \in (0, 1)$.

A straightforward calculation shows that for an interior solution in this case

$$\sigma(i) = \frac{p(1+f) - 1}{p - f(1-p)},$$

where

$$f = \left(\frac{(1-q)}{q} \left(\frac{(1-p)}{p} \right)^{n-k+1} \right)^{1/(k-1)}.$$

Again, since $\sigma(i)$ is the unique solution of 7 in this case, there is a unique responsive voting equilibrium in this case.

Whenever $\sigma(i)$ as defined by the previous two equations is less than zero, then $\sigma(i) = 0$; whenever $\sigma(i)$ as defined by the previous two equations is larger than 1, then $\sigma(i) = 1$.

Proof of Proposition 2

For sufficiently large n there exists a responsive voting equilibrium. To see this we first compute the limit equilibrium as $n \rightarrow \infty$ for the case in which $k/n = \alpha$. In case 2 we have

$$\sigma(i) = \frac{p(1+f) - 1}{p - f(1-p)},$$

where

$$f = \lim_{n \rightarrow \infty} \left(\frac{(1-q)}{q} \left(\frac{(1-p)}{p} \right)^{n-\alpha n+1} \right)^{1/(\alpha n-1)} = \left(\frac{(1-p)}{p} \right)^{1-\alpha},$$

and therefore we have

$$\sigma(i) = \frac{p(1+f) - 1}{p - f(1-p)} = \frac{p \left(1 + \left(\frac{(1-p)}{p} \right)^{(1-\alpha)/\alpha} \right) - 1}{p - \left(\frac{(1-p)}{p} \right)^{(1-\alpha)/\alpha} (1-p)}.$$

It is easily checked that $1 > \sigma(i) \geq 0$ for $1 > \alpha \geq 1/2$ with $\sigma(i) \rightarrow 1$ as $\alpha \rightarrow 1$. Similarly, in case 1 we have

$$\sigma(g) = \frac{\left(\frac{p}{1-p} \right)^{\alpha/(1-\alpha)} - 1}{p \left(\left(\frac{p}{1-p} \right)^{\alpha/(1-\alpha)} + 1 \right) - 1},$$

and again it can easily be checked that $0 < \sigma(g) \leq 1$ for $0 < \alpha \leq 1/2$ with $\sigma(g) \rightarrow 0$ as $\alpha \rightarrow 0$.

Together this implies that for any $0 < \alpha < 1$ there is a responsive limit equilibrium. Now a simple continuity argument implies that for sufficiently large n the solution to equations 7 and 8 must be arbitrarily close to the limit solution, and hence it follows that for sufficiently large n there is a responsive voting equilibrium.

To prove part (2) of proposition 3, observe that in the limit as $n \rightarrow \infty$ we have

$$\gamma_I = 1 - p + p \frac{p \left(1 + \left(\frac{(1-p)}{p} \right)^{(1-\alpha)/\alpha} \right) - 1}{p - \left(\frac{(1-p)}{p} \right)^{(1-\alpha)/\alpha} (1-p)}$$

and

$$\gamma_G = p + (1-p) \frac{p \left(1 + \left(\frac{(1-p)}{p} \right)^{(1-\alpha)/\alpha} \right) - 1}{p - \left(\frac{(1-p)}{p} \right)^{(1-\alpha)/\alpha} (1-p)}.$$

Note that for $0 < \alpha < 1$ this implies that

$$\gamma_G > \gamma_I - \varepsilon,$$

for some $\varepsilon > 0$ which depends on α .

Next we show that

$$\gamma_I < \alpha < \gamma_G. \quad (11)$$

To see why this is sufficient to prove proposition 3, note that by the law of large numbers the actual share of guilty votes converges to the expected share of guilty votes in each state. Hence, the share of guilty votes if the defendant is innocent converges to $\gamma_I < \alpha$ in probability, and the defendant is acquitted with probability close to one for large n . Similarly, if the defendant is guilty, the share of guilty votes converges to $\gamma_G > \alpha$ in probability, and hence the defendant is convicted with probability close to one for large n .

Suppose 11 is violated, and $\gamma_G > \gamma_I \geq \alpha$. From the equilibrium conditions we know that for all n

$$\frac{1}{1 + \frac{(1-p)(g_{ni})^{\alpha n-1}(1-g_{ni})^{(1-\alpha)n}}{p(g_{ng})^{\alpha n-1}(1-g_{ng})^{(1-\alpha)n}}} \geq q \quad (12)$$

(where g_{ns} denotes the equilibrium probability of a guilty vote in state s with n jurors). Note that $x^\alpha(1-x)^{(1-\alpha)}$ is a single peaked function for $x \in [0, 1]$ with a maximum at $x = \alpha$. If $\gamma_G > \gamma_I \geq \alpha$, then $(\gamma_I)^\alpha(1-\gamma_I)^{(1-\alpha)}/(\gamma_G)^\alpha(1-\gamma_G)^{(1-\alpha)} > 1$, and hence

$$\left(\frac{(\gamma_I)^\alpha(1-\gamma_I)^{(1-\alpha)}}{(\gamma_G)^\alpha(1-\gamma_G)^{(1-\alpha)}} \right)^n \rightarrow \infty.$$

The left-hand side of 12 must converge to zero as $n \rightarrow \infty$, and hence inequality 12 cannot hold. An analogous argument can be made if $\alpha \geq \gamma_G > \gamma_I$. Q.E.D.

Rational Choice and the Dynamics of Collective Political Action: Evaluating Alternative Models with Panel Data

STEVEN E. FINKEL *University of Virginia*
EDWARD N. MULLER

Causal inference in research testing rational choice models of unconventional political behavior has been hampered by the inability to use perceptions of the costs and benefits of participation at a given time to predict behavior that necessarily occurred in the past and by ambiguities associated with analyzing behavioral intentions instead of actual participation. Using panel data collected on a national sample in West Germany between 1987 and 1989, we show that variables from a "collective interest" model measured in 1987—individuals' dissatisfaction with the provision of collective goods, beliefs that group actions can be successful, and beliefs in the importance of their own participation—predict subsequent participation in collective protest activities. Variables corresponding to the private "selective incentives" associated with protest are found to be less relevant. Furthermore, we find that engaging in protest changes many of the perceptions that influence future participation. We discuss the implications for theories of political mobilization.

Perhaps no area in mass political behavior research is beset with such serious methodological difficulties as the study of participation in political protest and other unconventional activities. Some of the problems, such as finding and eliciting truthful responses from the limited number of individuals who engage in these types of behaviors, can and have been remedied through better sampling and more sensitive interviewing methods in national and local probability surveys. A more fundamental problem, however, is that unlike voting or campaign participation, unconventional behavior does not occur during fixed periods, and hence researchers typically cannot plan a study in advance of the specific activities they may wish to analyze. This means that almost all previous survey-based research on protest and unconventional political action is prone to what Green and Shapiro (1994, 85) term the "pedestrian methodological defect" of predicting *past* behavior from information gathered at the survey's current time.¹

This error would be less consequential for causal

inference if, as was common until recently, the principal explanatory variables of interest were such stable sociodemographic variables as race, gender, educational attainment, or social class or enduring attitudinal orientations, such as ideological or partisan identification (Barnes and Kaase 1979, Marsh 1977). In research of this type, it may be legitimate to assume that the explanatory factors did not change significantly since protest or other behaviors took place, and hence cross-sectional data can be useful in exploring causal hypotheses. More recent work in the field, however, has developed and tested models of unconventional behavior based on rational choice theory, and here the use of cross-sectional data is more problematic. Such models, adapted from the framework set forth by Olson (1965) in the well-known *Logic of Collective Action*, posit that individuals calculate the expected costs and benefits associated with various alternatives before deciding whether to participate in or abstain from collective activities (see the recent reviews in Leighley 1995, Whiteley 1995). Numerous studies drawing on the Olsonian *Logic* have appeared in the literature. Some identify the private payoffs, usually of a social or psychological nature, that allegedly motivate unconventional action (Chong 1991, Klandermans 1984, Opp 1989). Others show that individual preferences for public goods, coupled with estimates of the likelihood of group success in providing the goods through collective behavior and perceptions of the importance of personal participation, are the critical explanatory variables (Finkel et al. 1989, Muller and Opp 1986, Muller et al. 1991). All this work, however, must be viewed as incomplete in light of the fact that decisive tests of rational choice theories cannot be conducted with cross-sectional data using individuals' reports of past behavior.

Most obviously, an individual's "expected" utility from participation, by definition, refers to some future state, rendering reports of past participation irrelevant

Steven E. Finkel is Professor of Government and Foreign Affairs, University of Virginia, Charlottesville, VA 22901. The late Edward N. Muller was Professor and Head, Department of Political Science, University of Arizona, Tucson.

The data analyzed here were collected by Karl-Dieter Opp of the Universitaet Leipzig with the support of the Volkswagenstiftung. Finkel wishes to thank Paul Kingston, Paul Freedman, Benjamin Highton, Steven Schier, Paula McClain, several anonymous *APSR* referees, and especially Karl-Dieter Opp for valuable criticisms and comments. He is also grateful for the support of the University of Virginia's Center for Advanced Studies, where he was a Sesquicentennial Associate during the fall 1994 semester, when this work began, and in fall 1997, when it was completed. Finally, he wishes to acknowledge all the efforts of the University of Arizona's Department of Political Science in honoring Ned Muller's memory since his tragic death in summer 1995.

¹ Throughout the rest of the paper, the term "protest" connotes participation in a variety of legal and illegal collective activities, such as collecting signatures for petitions, taking part in a permitted demonstration, or taking part in public disorders. Some of the behaviors we analyze, such as working with a citizen's action group or signing a petition, are not unconventional in the usual sense, but we use the term "protest" to describe them, as all involve some form of organized demonstration of disapproval of governmental policy. The

theoretical discussion is applicable to all forms of collective political action.

from the point of view of rational choice theory. More practically, the variables critical to these theories, such as an individual's perceptions of the likelihood of group success or perceptions of material or social costs associated with participation in collective action, may not remain stable over time; indeed, to the extent that they are relevant predictors of participation, they should be precisely those attitudes and perceptions that protest groups and the government attempt to manipulate in order to encourage or discourage these forms of behavior (Lichbach 1995, chapter 3 and 8–10). Therefore, it cannot be assumed that the values of these variables at the time of a survey were similar to their values before the individuals actually took part in (or abstained from) protest or other unconventional activities (Pierce and Converse 1990). Moreover, individuals who have participated in protest may change their attitudes as a result of their past participation, either by absorbing new information about a given situation and their own capabilities or by rationalizing to themselves or the survey interviewer that their actions "must have" been due to their high levels of alienation, their strong belief that the protest group could be successful, and the like. For these reasons, cross-sectional data cannot show conclusively that current perceptions relevant to rational choice theories are the cause, and not the result, of the reports of individual behaviors that are elicited in a survey interview.²

One solution to this problem is to alter the dependent variable to represent the individuals' future *willingness* or *intention* to participate in protest activities. Much research in the field does make use of behavioral intentions as the dependent variable, sometimes weighting these intentions with reports of past behavior in order to make the intentions variable "more realistic" (following the procedures outlined by Muller 1979). Although these models help overcome the temporal ordering problem, they are unsatisfactory to the extent that, as is often the case, the relationship between behavioral intentions and actual behavior is weak. One reason is that there may be few collective protest opportunities in a given period, and so even highly "willing" individuals will not engage in actual behavior. Another is that we know that the relationship between voting intentions and voting turnout is less than perfect (Silver et al. 1986, Granberg and Holmberg 1988), and there is little reason to expect a *greater* degree of consistency between intentions and behavior in more irregular and sometimes illegal forms of political participation. Finally, the relationship be-

tween attitudinal independent variables and willingness to participate may be subject to rationalization effects, in that individuals who claim, for example, to be dissatisfied with government and who perceive that protest can be successful may reason that, with this constellation of attitudes, they "must be" willing to participate in protest behaviors. Alternatively, individuals who intend to protest may deduce that they "must have" attitudes commensurate with this behavioral intention. As Aldrich (1976, 322) notes in regard to voting and campaign participation, "it may well be that a citizen responds that he is greatly concerned about the election, that he believes the election to be very close . . . because he has already decided—perhaps, for quite different reasons than his responses might indicate—to go to the polls." For these reasons, the use of behavioral intentions in survey-based research on protest participation may be highly problematic.

To overcome these "pedestrian methodological defects," survey data are needed that provide individual reports of actual participation in protest activities over some finite period, as well as attitudes pertaining to rational choice theories that are measured *before* the behavioral time interval of interest. Clearly, the only type of study that provides these necessary data is a panel survey, in which interviews are conducted with the same individuals over time. *Yet, no panel study testing a model of this type exists in the literature.* Although there has been one large-scale cross-national panel study of protest in the late 1970s and early 1980s, along with several analyses of panel surveys of activist groups, or university and local area samples (Finkel 1987, Jennings et al. 1990, Klandermans 1984, Oegema and Klandermans 1994, Opp n.d., Opp and Ruehl 1990), none of this research contains the most basic test that should be conducted with panel data: whether attitudes relevant to rational choice theories that are measured at a given time are independent causes of the individual's *subsequent* behavior. By specifying that attitudes must exert influence on behavior measured at some future time, such a panel model would represent a more conservative test of whether rational choice variables are related to political participation. Furthermore, few studies exploit panel data to determine the extent to which theoretically relevant independent variables may themselves be affected by protest participation, producing either a reciprocal causal relationship with behavior or a unidirectional relationship in which the causal effect runs only from behavior to attitude (Finkel 1987, Opp n.d.).

In this paper, we attempt to resolve these controversies by testing rational choice theories of participation with national survey panel data on political protest collected over time in the Federal Republic of Germany. Using individuals' reports of their actual participation in legal and illegal protest, and attitudes and perceptions measured before the behaviors in question, we test models of the causes and effects of individual protest participation on variables associated with several variants of rational choice theory. Our findings suggest that individual participation in protest is determined primarily by variables from what we term

² Some cross-sectional work on political participation (e.g., Verba et al. 1995) attempts to circumvent the simultaneity problem by using two-stage least squares (TSLS) or some related statistical procedure. This is a clear improvement over the use of ordinary least-squares (OLS) regression, but some difficulties remain in applying this technique. It is still problematic theoretically to assume that an attitude at a given time (even if purged of its association with participation's error term) has a causal effect on reported behavior that occurred in the past. Moreover, TSLS depends on specifying outside instrumental variables that have a relatively strong effect on either participation or the attitude in question (but not both), and such variables are notoriously difficult to find.

a *collective interest* model: individual preferences for public goods, perceptions of the importance of personal participation in collective efforts to achieve the good, and perceptions of the likelihood of group success. Variables associated with private material, social, or psychological "selective incentives" such as monetary payoffs, social pressure from significant others, and the expressive benefits of participation, are found to be less relevant as determinants of protest behavior. Moreover, several of the variables in the collective interest model are found to have a reciprocal relationship with protest behavior, as protest groups attempt to influence these perceptions and attitudes through the mobilization process itself. By contrast, the links between the selective incentives and participation, when they exist at all, are primarily unidirectional, as individuals adjust their current expectations of private rewards and costs in response to past participation in (or abstention from) collective protest activities. These findings have considerable implications for understanding both the dynamics of protest participation and the explanatory power of alternative versions of rational choice theories of collective behavior.³

TESTING RATIONAL CHOICE MODELS OF PROTEST: PROBLEMS OF CAUSAL INFERENCE

The logic of individual participation in collective action, derived from Olson's (1965) seminal exposition, is well known. In large groups, each individual reasons first that his or her participation will have little marginal effect on the likelihood that collective action will be successful. Furthermore, individuals who do not participate cannot normally be denied the benefits of the "public goods," for example, a change in regime or public policy, that successful collective action can provide. As a result, rational individuals will prefer to abstain, or "free-ride" on the efforts of others, reasoning that abstention will bring the same expected benefits as participation without any of the potentially severe personal, legal, and opportunity costs involved in protest behavior.

How, then, do we account for the fact that individuals do take part in collective protest activities? Although Lichbach (1995) identifies about two dozen different potential "solutions" to the free-rider problem, scholars in the survey research tradition generally have focused their efforts in two directions: (1) measuring individual demand for public goods and perceptions of individual and group efficacy to determine whether the combination of these *collective interest*

variables yields, *contra* Olson, a nonzero expected benefit from participation, and (2) specifying the private payoffs or *selective incentives* that are available only to collective action participants and hence may produce greater expected benefits to the individual from participation than abstention. Empirical research has shown support for these efforts in tests conducted with cross-sectional data in a variety of national and local settings (Finkel et al. 1989; Finkel and Opp 1991; Gibson 1997; Klandermans 1984; Klandermans and Oegema 1987; Muller and Opp 1986; Muller et al. 1991; Opp 1988, 1989; Walsh and Warland 1983).⁴ Although the presumption in such studies is that these "expected utility" incentives provide motivation for individual participation in collective political action, there are several reasons to suspect that the effect of past behavior (or current behavioral intention) on current attitudes accounts for at least part of the cross-sectional covariation between these variables.

Consider first the collective interest model, elaborated most recently in Finkel et al. (1989) and Muller et al. (1991). This model posits that individuals will participate in protest activities to the extent that (1) they have high levels of discontent with the current provision of public goods by the government or regime, (2) they believe that collective efforts can be successful in providing desired public goods; and (3) they believe that their own participation will enhance the likelihood of the collective effort's success (see also Klandermans 1984). The positive expected utility of participation over abstention in this model follows from the fact that, in contrast to the Olsonian version of conventional rational choice theory, individuals will not necessarily perceive that the importance of their own participation in the collective effort is negligible. The perceived importance of personal participation may stem either from an individual's general sense of political resourcefulness or subjective efficacy (cf. Verba et al. 1995) or from the individual's adherence to strategic beliefs, such as "united we stand, divided we fall," that promote what Finkel et al. (1989) termed "collective rationality." In either case, discontented individuals will be motivated to participate so long as the overall likelihood of group success is reasonably high; if the cause is hopeless, then even subjectively resourceful individuals will realize that there are too few participants to make a difference, and appeals to group unity will have little effect. The model thus posits that individuals will attempt to achieve collective goods through political participation, but that rational individuals will do so only when the collective chances of success and their own personal influence are high.

Although the collective interest model has received strong support in these cross-sectional studies, several alternative causal processes cannot be ruled out in the tests conducted to date. The problems stem from the

³ We note that the paper is limited to evaluating alternative models of collective action derived from rational choice theory, not all extant theories of political participation, such as relative deprivation, the SES and resource-based models found in Verba et al. (1995), and the "opportunity structure" models developed by Tarrow (1995) and others. Future research should explore the extent to which variables from these theories represent antecedents to the "inside the head" subjective expected utility judgments that, from the perspective of rational choice theory, are the proximate causes of participation in collective political action.

⁴ This is not to suggest that these "solutions" may be found *only* in the survey-based literature. Chong (1991), Lohmann (1994), and Oberschall (1980, 1994), for example, use them to explain past social movements, such as the American civil rights movement and the East German revolution of 1989.

use of behavioral intentions and past participation as dependent variables, both of which may be the cause, and not the effect, of the model's independent variables. One possibility is that respondents are bringing their attitudes in line with their behavioral intentions through a rationalization process: People at a given time may be willing to take part in protest activities for reasons unrelated to the collective interest model and then report a high degree of political discontent or perceptions of the likelihood of group success as a result. Green and Shapiro (1994, 85–6) seem to have this possibility in mind when they suggest that individuals' (mis)perceptions of personal and group influence are part of the "ideology of activism," by which individuals who are otherwise oriented to protest may be inclined to claim that they and the groups to which they belong have much influence on the potential provision of public goods.

The problem of reciprocal causal influence is perhaps even more serious in analyses in which the dependent variable is past participation, or behavioral intentions *weighted* by past participation. Previous research with panel data has suggested that participation in collective action may have an effect on both preferences for public goods and perceptions of personal influence (Finkel 1987, Opp n.d.). More generally, much recent scholarship supports the notion that the beliefs and values relevant for protest are "temporally variable and can be modified during the course of actual participation and by the micromobilization efforts of social movement organizations" and protest groups (Snow et al. 1986, 471). Groups attempt to mobilize individuals by "identifying a problematic condition and defining it as unjust, intolerable, and deserving of corrective action," that is, changing individuals' preferences for public goods (Snow and Oliver 1993, 31–3); by "amplify[ing]... beliefs regarding the efficacy of their campaigns" (Snow et al. 1986, 471); and by stimulating a sense of group unity and necessity of each individual's participation (Gamson 1992, Schwartz and Paul 1992). To the extent that these processes occur, then past behavior and participation in mobilization efforts will have significant effects on current levels of preferences for public goods and individual and group efficacy, thus biasing existing cross-sectional analyses that include past behavior in the construction of the dependent variable.

Similar problems pervade research that, in contrast to the collective interest model, emphasizes the private payoffs or selective incentives that may overcome the pressure for individuals to free ride in collective action situations. Previous research has suggested that social and psychological incentives are far more relevant for protest behavior than material rewards and costs (Klandermans 1984, Muller et al. 1991, Opp et al. 1995; but see Lichbach 1994). Yet, for these types of variables, there are strong possibilities of attitude rationalization and reciprocal causal relationships that may contaminate causal inference in cross-sectional studies. Following "resource mobilization" theories of collective action, much research has hypothesized that individuals respond to the norms and expectations of other

people within their social network and hence derive benefits from adhering to the behavioral norms of individuals and groups with whom they identify (Klandermans 1984, McAdam and Paulsen 1993, Opp 1989). Friedman and McAdam (1992, 161) argue explicitly that social networks draw individuals into collective action by providing incentives, such as friendship or social honor, that may be obtained by "responding to the call of network partners," and Morton (1991) and Uhlaner (1989) express similar sentiments in their work showing how group memberships and strategic group interactions may overcome pressures for individuals to free ride. Yet, certainly individuals' reports of expected social pressures in a survey situation are subject to rationalization effects, and it is equally plausible that integration into groups or association with significant others who encourage protest is the result of past activities and not necessarily an independent influence on current behavioral intentions or future behavior.

These alternative possibilities may be even more pervasive in the case of the theoretically controversial "psychic," "expressive," or "in-process" rewards that have been put forward as possible motivations for participation. Recent studies have hypothesized that a variety of these "soft incentives" may motivate participation: Individuals may derive psychic satisfaction or suffer guilt from adhering or not adhering to personal norms about taking part in illegal political actions; they may participate in order to "stand up for what they believe in," to gain knowledge about politics, or simply because of the sheer entertainment value involved in group political activities (Finkel and Opp 1991, Muller et al. 1991, Opp 1989, Whiteley et al. 1994). But there is also the possibility that individuals' past behavior and current behavioral intentions have strong effects on responses to survey questions regarding these types of rewards. Elster (1989, 214) speculates that internalized norms of behavior "may be mere rationalizations with no independent motivating power," and it is easy to imagine that individuals who have participated in the past would claim to expect some psychic reward from "standing up" for their political beliefs through collective protest. Thus, the possibilities of attitude rationalization or reciprocal causal influence between attitudes and behavior means that cross-sectional tests of the effects of selective incentives on protest, as well as the effects of the collective interest variables, must be viewed as inconclusive.

DATA AND METHODS

These difficulties can be overcome to a large extent through the analysis of panel data, in which attitudes, cognitions, and behaviors are measured over at least two points in time. Panel data offer several key advantages for our current concerns.⁵ First, they enable us to model the effects of expected utility variables measured at one point in time on an individual's self-reported

⁵ Kessler and Greenberg (1981) and Finkel (1995) discuss the advantages of panel data in more detail.

behavior at a later date. The analysis of actual behavior is a clear improvement over the reliance of previous research on behavioral intentions or some hybrid dependent variable; equally important, by using wave 1 attitudes to predict behavior during the wave 1 to wave 2 interval, the potential simultaneity biases that exist in cross-sectional designs are eliminated. In addition, the inclusion of prior participation measured in wave 1 as a predictor of wave 1–2 behavior serves partially to control for omitted variables that influence behavior at both periods. Thus the panel design will provide a more rigorous and conservative test of the effects of collective interest variables and selective incentives on the individual's subsequent decisions to participate in collective protest behaviors, controlling for past participation.

Second, the analysis of panel data allows us to take into account the possibility of dynamic reciprocal relationships between all independent variables and participation. That is, in addition to predicting subsequent participation from wave 1 attitudes, we may also use reports of participation in the first wave to predict the collective interest and selective incentive variables measured in wave 2. The results of all these tests will enable us to assess whether the collective interest and selective incentives are reciprocally related to protest; whether the attitudes cause, but are not caused by, participation in collective protest; or whether the sole causal effect between the variables runs from participation to attitudes and not the reverse. In the latter case it may be concluded that individuals are adjusting their perceptions of costs and benefits to rationalize prior behavior, which was caused by other factors altogether.

We test these models with panel data from a representative survey ($N = 714$) of adults (age eighteen and older) conducted in West Germany between November 1987 and January 1988.⁶ Reinterviews with 377 respondents were conducted between October 1989 and January 1990. We analyzed the differences between the respondents who were reinterviewed in the second wave ($N = 377$) and those who were not reinterviewed ($N = 337$) by comparing the means of all independent variables and the participation scales for the first wave. The only significant difference to emerge between the panel participants and other respondents was for the former to have slightly lower scores (2.2 to 2.3 on a five-point scale, $\eta^2 = .09$) on an "internal behavioral norm" that measures the extent to which the respondent believes political protest and violence are morally justified (the index is described in more

detail below). We thus conclude that the panel respondents are an unbiased sample of first-wave respondents.

The main drawback to this analytic approach, however, is that because collective protest participation is relatively uncommon, our sample of 377 panel respondents did not yield a large number of actual participants. To maximize the variability on the dependent variable, we chose to combine a number of acts of unconventional participation into one scale. We constructed a variable representing the individual's participation in each panel wave by counting the number of the following activities in which the respondent had engaged "within the past two years": took part in a permitted demonstration; signed a petition; worked with a citizen's action group; participated in an organized effort to solve a neighborhood problem; wore a button or a sticker for a political cause; collected signatures for a petition; took part in a demonstration that broke the law; seized buildings, such as factories or government or university offices; participated in confrontations with police or other governmental authorities; participated in political activities that resulted in property damage; participated in protest activities at the workplace which were against the law; participated in confrontations with other political groups or individuals; and took part in public disorders. These activities vary widely in their nature and severity; nevertheless, they constitute a reasonably reliable scale in both panel waves, with coefficient alpha being .78 in the first wave and .76 in the second. Table 1 shows the distribution on the participation scale, and it can be seen that there is reasonable variation in the number of reported activities within each year. The table indicates that, as expected, the large majority of respondents either were completely inactive or participated in one or two of these behaviors, while about 10% report engaging in five or more activities in both waves.

We measured all independent variables in similar ways as in previous research, with the proviso that incentives for *legal* and for *illegal* behaviors were combined into an additive scale to correspond to the combined nature of the dependent variable. The question wordings (in English) can be found in the Appendix.

Measurement of Collective Interest Variables

Public Goods Dissatisfaction was the average of an individual's score on five measures of policy dissatisfaction: the extent of unemployment; the differences between rich and poor; environmental pollution; nuclear power stations; and the deployment of missiles. Respondents were asked to indicate their concern about each issue (0–4 scale) and then rate the performance of the government in each area (0–5 scale). The concern scores were multiplied by the performance scores, and the variable was then converted to a 0–1 scale, with higher numbers representing higher levels of overall dissatisfaction with the provision of public goods (cf. Finkel et al. 1989).

⁶ The data were collected by the Gfm-Getas Survey Research Institute in Hamburg, a firm with expertise in designing and implementing surveys on protest and political participation. Each survey was a probability sample drawn according to the design of the working group of German market research institutes. In this procedure the first step is to select sample points (voting districts). Then the interviewer looks for households according to a random route procedure. Finally, a member of the household is randomly selected to be interviewed. More detailed information about this data set and the broader research project from which it is taken can be found in Finkel et al. 1989, Finkel and Opp 1991, Muller et al. 1991, and Opp et al. 1995.

TABLE 1. Distribution of Sample on Protest Participation, 1987 and 1989 (N = 377)

Number of Activities	1987	1989
0	50.9%	44.0%
1	14.1	18.0
2	9.3	11.4
3	8.0	8.8
4	9.0	6.4
5	4.2	5.0
6	1.9	4.5
7	1.9	1.9
8	.8	0.0

Likelihood of Group Success is the product of (1) the extent to which respondents believe that groups have helped their cause in the past through legal and illegal protest and (2) their perception that other people with views similar to theirs are likely to participate in either legal or illegal collective political action. The scores were created by multiplying the "past group success" value by the "willingness of others" value. We then averaged the legal and illegal scores and converted the variable to a 1–5 scale corresponding to the respondent's perception of the likelihood of group success in providing public goods through collective action.

Perceived Personal Influence was the combination of the individual's perceptions of the extent to which s/he "personally could have an influence on politics if [s/he] participated in each of five legal or illegal behaviors, and two questions measuring an individual's general level of perceived influence: "There is no point in getting involved in politics because I would have no influence anyway," and "If I were more involved in politics, I would have more influence on what happens." The variable was converted to a 1–5 scale, with higher values representing higher levels of perceived personal influence.

Necessity of Group Unity was composed of responses to two questions: "Every individual member is necessary for the success of a political group, no matter how large it is," and "For groups to have a reasonable chance of success by means of political action, everyone must contribute a small part." The variable was scored from 1 to 5, with higher values representing a stronger belief in the necessity of group unity.

Measurement of Costs

We included three measures of the costs of participating in collective political action. *Trouble with Police* was measured on a 1–4 scale corresponding to the perceived likelihood that the individual "would get into trouble with the police or the courts" if s/he participated in legal or illegal political action. *Could Get Hurt* used a 1–4 scale measuring the perceived likelihood of physical harm from legal or illegal action. *Take Too Much Time* used a 1–4 scale measuring the perceived time constraints faced by the individual who engages in legal or illegal protest.

Measurement of Selective Incentives

We measured seven selective incentives that individuals may perceive as material, social, or psychological "payoffs" from collective political action. *Financial Gain* was a 1–4 scale corresponding to the likelihood that the individual would "gain financially" if s/he participated in legal or illegal action. *Expectations of Others* was a 1–5 scale corresponding to individuals' perception of the extent to which people who are important to them (spouse, friends, colleagues, or others) would think "very positively" (5) to "very negatively" of them if they participated in legal or illegal protest. *Group Encouragement* was a count of the number of groups to which individuals belonged that encouraged either legal or illegal protest from its members. *Gain Knowledge* was a 1–4 scale measuring the extent to which individuals "would understand politics better" if they participated in either legal or illegal protest. *Stand Up for Beliefs* was a 1–4 scale measuring the extent to which the individual would "feel good because I had stood up for something I believe in" through legal or illegal protest. *Entertainment* was a 1–5 scale measuring the extent to which "being involved in politics is a very enjoyable experience." *Internal Behavioral Norms* was a 1–5 scale measuring the extent to which individuals believe that violating the law and engaging in political violence in the pursuit of certain political goals is morally justifiable; politics should not be left to elected officials; and dissatisfied citizens have a "duty" to do something about it. All selective incentives variables except for internal behavioral norms were coded so that higher values mean a greater perceived benefit from participation; higher values on the norms index indicate a greater psychological cost from taking part in morally unjustifiable protest behaviors.

We first estimate regression equations that correspond to the tests of the collective interest model in previous research, using independent variables measured in 1987 to predict reported participation in the 1987–89 interval (as measured in the second wave in 1989). We then include the selective incentives variables and assess the explanatory power of a full model predicting 1987–89 collective political action. In equation form:

$$P(1987-89) = \beta_0 + \beta_1 P(1985-87) + \sum \beta_k CI(1987)_k + \sum \beta_j SI(1987)_j + \sum \beta_i C(1987)_i + U_1, \quad (1)$$

where $P(1987-89)$ represents the participation scale measured in wave 2, $P(1985-87)$ represents the participation scale measured in wave 1, $CI(1987)_k$ represents each of the k 1987 collective interest variables, $SI(1987)_j$ represents each of the j 1987 selective incentives, and $C(1987)_i$ represents each of the i 1987 perceived costs of participation.⁷

⁷ It should be noted that equation 1 contains no instantaneous effect from the collective interest variables in wave 2 on wave 2 participation. According to the temporal logic developed in the paper thus far, we rule out the possibility that participation that took place in the 1987–89 interval could be caused by any 1989 attitudinal variable.

TABLE 2. Collective Interest and Selective Incentive Models of Protest Behavior, 1987–89

Variable	(1)		(2)

We then examine the reciprocal linkages between behavior and the variables in both the collective interest and selective incentives variables by specifying equations predicting the wave 2 values of each incentive in 1989 from its prior value and from prior participation reported in wave 1 between 1985 and 1987. In equation form:

$$SI(1989)_j = \beta_0 + \beta_1 SI(1987)_j + \beta_2 P(1985-87) + U_j, \quad (2)$$

and

$$CI(1989)_k = \beta_0 + \beta_1 CI(1987)_k + \beta_2 P(1985-87) + U_k, \quad (3)$$

where $SI(1989)_j$ and $CI(1989)_k$ represent the 1989 (wave 2) values of the j and k selective incentives and collective interest variables, respectively.⁸ Equations 2 and 3 are estimated separately for each collective interest and selective incentive, as will be seen in Table 4.

In combination, the two sets of analyses represent a variant of the basic two-wave cross-lagged panel model, which alleviates many of the ambiguities of the temporal ordering and simultaneity biases that have marred previous empirical tests of these relationships. Despite this attention to the problems of causal order, however, equations 1–3 still may have omitted relevant variables, and in later analyses we include education, age, and social class to control for these variables' own causal

effects as well as their effects as possible proxies for other factors that may influence both participation and the rational choice variables.

RESULTS

We examine first the collective interest model, which predicts protest from the individual's dissatisfaction with the provision of public goods, perceptions of the likelihood of group success, and perceived importance of personal participation. Model 1 in Table 2 shows the results of an equation predicting reported (logged) protest participation between 1987 and 1989 with the collective interest variables, controlling for reported 1985–87 behavior (logged) and several perceived costs of protest. All independent variables are taken from the 1987 (wave 1) survey, are measured as described in the previous section, and are logged to correspond to the logarithmic regression models conducted in previous research (Finkel et al. 1989, Muller et al. 1991). These log-log equations express in additive form the interaction between preferences for public goods and perceptions of group and individual efficacy that is posited by the collective interest model.

The first model in the table shows that three of the four variables from the collective interest model, measured in 1987, are all statistically significant predictors of future protest behavior. While the strongest influence on 1987–89 behavior is past behavior, these collective interest variables have standardized regression coefficients between .10 and .13, and taken together the model explains about one-fifth of the variance in reported 1987–89 protest behavior. Considering the two-year lag between measurements and the summary nature of the dependent variable, this is strong evidence supporting the hypothesis that the collective interest variables exert influence on future protest behavior, independent of possible reciprocal

⁸ It is also possible that wave 2 participation (which measures behavior undertaken in 1987–89) influences wave 2 (1989) incentives. If that is the case, then the results reported in Table 4 below may *underestimate* the effect of participation on the rational choice variables. But given that such a specification would directly contradict virtually all previous cross-sectional research in the field of political participation, we decided on the more conservative formulation, whereby we predict wave 2 incentives only from wave 1 (1985–87) participation.

relationships between these variables and independent of the contaminating effects of attitude rationalization.⁹

Interestingly, the cost variables also influence protest in the expected negative direction, with too much time achieving statistical significance at the .05 level and the effect of trouble with police having a *t* value of -1.6. This indicates that individuals are balancing the perceived benefits from their participation in protest with perceived opportunity costs and with potential costs related to legal or official sanctions. These results support the findings from the analysis of protest in Peru (Muller et al. 1991) but run counter to the finding of the so-called martyr effect among antinuclear activists in West Germany in the early 1980s (Muller and Opp 1986), where perceived costs were *positively* related to protest potential. It is possible that the latter effect, one that has puzzled scholars since its publication (cf. Klosko 1987, Opp and Ruehl 1988), was produced by individuals adjusting their perceptions of costs upward after having decided to participate in collective protest activities. The negative relationship between perceived costs and subsequent protest here supports a more traditional rational choice interpretation.

The second model from Table 2 represents the full participation model specific to equation 1 above and includes a series of material, social, and psychological selective incentives into the predictive equation: expected financial and occupational gains or losses, conforming to the behavioral norms of others or groups to which the individual belongs, and the "in-process" rewards of gaining knowledge, entertaining oneself through protest, standing up for one's political views, or conforming to one's own internalized norms for or against violent political behavior. In contrast to the results of previous cross-sectional research, we find that the values of these variables in 1987 are relatively weak predictors of subsequent behavior. The selective incentives add little to the explanatory power of the entire equation, with adjusted R^2 reaching .21, and only one variable in the entire set, belonging to groups that encourage protest, is statistically different from zero at the .05 probability level. In comparison, the coefficients for public goods dissatisfaction, perceived likelihood of group success, and perceived personal influence all remain statistically significant, with little change in their substantive magnitude from equation 1.¹⁰

It is possible, however, that the results in Table 2

⁹ We tested the hypothesized interaction effect of the variables in the collective interest model in another way by first creating a multiplicative variable comprised of public goods dissatisfaction, likelihood of group success, and perceptions of personal influence (the three significant variables in the model). We then tested whether the individual variables had a significant effect on participation independent of the multiplicative interactive variable. In each case the multiplicative variable was significant, and the individual variable was not.

¹⁰ The results are stable even after taking into account the possibility that measurement error accounts for some of the observed change in participation over time (cf. Finkel 1995). Under the assumption that the reliability of the participation scale is .76 in wave 2 and .78 in wave 1 (see p. 12), we reestimated the model of Table 3 in LISREL

TABLE 3. Regression Model Predicting Protest Behavior, 1987–89, with Summary Measures and Demographic Controls

Variable	Unstandardized	Standardized
1985–87 Behavior	.22*** (.05)	.22

* $p < .05$, ** $p < .01$, *** $p < .001$ (one-tailed). $N = 377$. Standard errors in parentheses.

underestimate the effects of selective incentives and material costs, as the ten individual variables may exert stronger influence when combined into more reliable summary indices. We therefore conducted a principal components factor analysis of the selective incentives and costs variables and uncovered a two-factor solution. Summary factors were created from the factor scores associated with each variable. One factor includes the variables too much time, trouble with police, and could get hurt, along with a (negatively loading) financial gain, and we label this factor "Material Costs." The other factor includes all other selective incentives in Table 2 except for group encouragement, which loaded on neither factor. We show in Table 3 the results of a model predicting protest behavior with these two factors, group encouragement, a summary multiplicative measure of the collective interest variables, and past behavior. We also introduce the demographic controls of education (coded from 1 for "left school without elementary diploma" to 5 for "completed Abitur or university entry diploma"), age (in years), and self-reported social class (coded from 1 for "lower class" to 5 for "upper class").

The results strongly confirm the conclusions reached above. The summary factor for selective incentives is irrelevant for protest participation, while the collective interest variable has the strongest standardized effect on 1987–89 behavior of any variable except for past behavior. Group encouragement also remains statistically significant, and the summary factor of material costs exerts a relatively strong and significant negative effect on participation. These effects, in addition, hold after controlling for standard demographic influences on behavior.

The panel analyses show clearly that the factors leading individuals to engage in political protest are those in the collective interest model, along with an independent effect of group mobilization. To some extent, these findings parallel those in previous research, in which the collective interest model as a whole typically outperformed models based on selec-

and found that the magnitude of the coefficients and their statistical significance remained largely unchanged.

TABLE 4. Regression Models Predicting 1989 Selective Incentives and Collective Interest Variables

Dependent Variable	Lagged Dependent Variable 1987	Participation 1985-87	Education 1989	Age 1989	Class 1989	Adjusted R^2

tive incentive variables in explaining protest in several national settings (Muller et al. 1991, Muller and Opp 1986). Yet, in prior cross-sectional studies, several of the most important explanatory variables have been the individual's desire to conform to the behavioral norms of important others, to stand up for one's beliefs, and to adhere to one's own internalized norms against protest behavior. We suggest that the cross-sectional findings may have been produced by the effect of past behavior on the selective incentives, and this possibility is explored with the panel data below.

The top half of Table 4 shows the results of the estimation of equation 2 above, the model predicting each of the selective incentives, as measured in 1989 (wave 2), from its value in 1987 and 1985-87 reported protest participation, with education, age, and social class included as controls. As can be seen, participation has a statistically significant effect on three of these variables: standing up for one's beliefs, the entertainment value of protest, and belonging to groups that encourage protest. Past participation also has a significant influence on the overall selective incentives factor described above. In combination with the results of Table 3, these findings indicate that, except for group encouragement, the relationship between participation and selective incentives is unidirectional: Participation affects these attitudes, but the attitudes have no independent effect on subsequent participation. This is evidence of a rationalization process, whereby individuals take part in protest activities and then claim, for example, that they "would feel good" for standing up for what they believe, *without those attitudes being true causes of future participation*.

Table 4 also shows that protest participation influences the individual's propensity to join groups that encourage these forms of behavior. This finding, along with the results of tables 2 and 3, supports the notion that integration into protest groups is both a cause and effect of collective action. Individuals are mobilized by their membership in groups that encourage protest; at the same time, taking part in protest stimulates indi-

viduals to extend their memberships in like-minded organizations. These tables demonstrate clearly a key element in the mobilization process, the mutually reinforcing relationship between organizational activities and participation in collective action.

A similar pattern of reciprocal linkages between participation and attitudes can be seen for several of the collective interest variables in the bottom portion of Table 3. Participation has a significant effect on individual and group efficacy, indicating that prior behavior leads individuals to adjust their perceptions of both group and individual influence upward. These variables were shown in Table 2 to have significant effects on subsequent participation as well, indicating that two of the critical attitudes that predict protest are reinforced by taking part in protest behavior. Protest participation thus sets in motion a process of attitude adjustment and reinforcement of several of the collective interest variables, which then facilitate subsequent behavior. Interestingly, adding the 1987 value of group encouragement to these models (not displayed) shows that prior membership in protest-encouraging groups leads to marginally higher levels of group and individual efficacy in 1989 (t statistics of 1.5 and 1.6, respectively), supporting the notion that protest groups attempt to increase future participation by influencing individuals' perceptions of the likelihood of group success and their own importance of contributing to the collective cause (Klandermans 1992, Snow et al. 1986). The mobilization process in general is thus characterized by a series of mutually reinforcing relationships among prior participation, group memberships, and key variables in the collective interest model.¹¹

¹¹ Taking measurement error into account under the assumption that the reliabilities of past participation and all other variables are .78, LISREL estimates of the models in Table 4 produce similar results. In particular, the standardized effects of past participation on perceptions of group success and personal influence are .11 and .12, respectively, and the effect of past participation on the summary

CONCLUSION

Previous research that has tested rational choice models of political protest with cross-sectional data has been unable to establish that the benefits perceived by individuals are the cause, and not the effect, of participation in collective action. Causal inference in the cross-sectional case has been hampered by the inability to use perceptions of the costs and benefits of participation at a given time to predict behavior that necessarily occurred in the past and by ambiguities associated with analyzing behavioral intentions instead of actual protest participation. We have argued that the analysis of panel data can overcome both of these difficulties. Using panel data collected on a national sample in West Germany between 1987 and 1989, we have shown that variables comprising what we have termed a collective interest model measured in 1987 do predict reported participation in protest activities during the subsequent two-year interval. Individuals participate in collective protest when they are dissatisfied with the current provision of public or collective goods, when they believe that group actions can be successful, and when they believe that their own participation is important for group success. Other variables related to rational choice—corresponding to the selective incentives or private material, social, and psychic payoffs associated with protest—are found to be weaker predictors of future behavior. Put simply, what matters for protest behavior are not private incentives but, rather, collective goals, collective chances for success, and the individual's estimates of his or her own importance for the collective outcome.

The findings have considerable implications for recent disputes surrounding the applicability of rational choice theory in explaining political participation (Green and Shapiro 1994, Whiteley 1995). Much of the controversy involves the legitimacy of including "soft selective incentives," such as social approval, entertainment, or standing up for one's beliefs, into rational choice models. We believe that these factors can be included *provided* that they are specified and measured in advance of the behaviors in question, thus overcoming the criticism that they represent post hoc embellishments to explain unanticipated behavior. But in so doing, the analyses here suggest that the "soft incentives" empirically are less important than previously found in cross-sectional research; moreover, the models in Table 4 show that these variables are largely rationalizations of prior participation, with weak independent explanatory effects.¹² To this extent, the results stand the traditional view of selective incentives on its head: Rather than participation being the "by-product" of private payoffs to the individual, it appears that expectations of social and psychological rewards are the by-products of past participation! Thus, the

heated debate about the "rational choice" status of these types of variables in this instance has relatively little empirical relevance.

We disagree strongly, however, with the criticism that the rational choice approach must necessarily exclude individual (mis)perceptions of personal influence, and by extension individual preferences for public goods and perceptions of the likelihood of group success. Theoretically, the collective interest model is consistent with the subjective expected utility framework, as individuals attempt to achieve benefits (such as a change in government policy), subject to the constraints that the benefits are collectively possible to obtain, that their own participation is important for the benefit's provision, and that the material and opportunity costs of participation are not too high. Some, however, assert that an "objectively" false belief, such as a nonnegligible perception of personal influence on the provision of a public good, has no place in a rational choice model (Klosko 1987, Green and Shapiro 1994). Yet, there is much philosophical disagreement on this point; scholars such as Simon (1985) and Benn and Mortimore (1976) assert that acting efficiently on the basis of even imperfect information may be considered "procedurally" or "practically" rational. Elster (1985, 9) similarly claims that an action is rational if, "given the beliefs of the agent, the action was the best way for him to realize his plans and desires." And given the fact that perceptions of efficacy correlate strongly with indicators of political resources, such as education, income, and cognitive skills (Barnes and Kaase 1979, Verba et al. 1995), it is by no means clear that the individual's belief in his or her own political influence is "objectively" false (see also Lohmann 1994). Following these notions, the collective interest model falls squarely within the family of rational choice explanations.

Empirically, the results attest unequivocally to the importance of personal influence and the other variables in the collective interest model in motivating individual participation. Equally important, we have shown with panel data that perceptions of individual and group efficacy are not merely rationalizations of an individual's prior willingness to participate or measurement artifacts of the "ideology of activism" (Green and Shapiro 1994, 85–6). Instead, these perceptions are significantly related to future behavior, and indeed they serve as the key links between individuals' political discontent and their decision to participate in or abstain from collective political action. This is the essence of the collective interest model, and this study provides its strongest confirmation to date.

The results reported here also shed light on more general issues related to political mobilization. Much recent literature (e.g., Lichbach 1995, Snow et al. 1986), for example, describes how dissident groups attempt to mobilize participation by altering perceptions of both the "probability of winning" and the individual's estimate of the "probability of making a difference," precisely the terms shown to be relevant here in motivating individual behavior. Moreover, we found considerable evidence that individuals who en-

selective incentives index is .16. The effect of participation on group encouragement is, however, weakened to a standardized value of .07.

¹² It is possible, however, that the soft incentives influence participation over a shorter time lag than was measured in this study, and future research should address this possibility with panel data collected over shorter intervals.

gage in protest begin to perceive that their own actions and those of the group may be more successful, and indeed many individuals who protest at one point go on to join organizations that encourage future protest behavior. These processes support the view in social movement research which claims that "the cognitions relevant to collective action—be they preferences, values, interests or utilities, costs or benefits . . . are . . . dynamic and evolving entities" (Snow and Oliver 1993, 33), with individuals who protest at one time coming to accept more readily the "motivational frames" that make future behavior more likely. The reciprocal causal effects found here suggest that the act of engaging in collective protest changes precisely those perceptions and cognitions that influence subsequent participation.

Finally, the fact that protest participation influences individual perceptions and cognitions serves as a caution against attempts to test attitudinal models of political behavior with cross-sectional data. We agree that "one may be rightly skeptical of surveys that ask people to recount the reasons behind [their] actions, . . . particularly when the survey takes place long after the fact" (Green and Shapiro 1994, 85; Leighley 1995), and it was precisely this skepticism that motivated our use of a panel design in this study. It must be recognized that attitudes measured at one point can best be used to predict subsequent political participation, as a substantial portion of the cross-sectional covariation between attitudes and behaviors may be due to the effect of past behavior on current attitudes. This problem, moreover, is not limited to rational choice models of protest; it potentially will affect other models, such as those based on theories of relative deprivation or postmaterialism, that specify political and social attitudes as causes of behavior. Panel data are ideal for the estimation of such models, and such data provide the additional benefit of allowing for more complex analyses of the dynamic processes by which individuals come to participate in the pursuit of collective ends.

APPENDIX. QUESTION WORDINGS FROM THE 1987–89 GERMAN PANEL STUDY

Collective Interest Variables

Public Goods Dissatisfaction

Concern about Problems. Would you tell me now, how concerned you are about the following problems?

Response values: 0 for "not at all concerned" to 4 for "extremely concerned."

1. The extent of unemployment
2. The differences between rich and poor
3. Environmental pollution
4. Nuclear power stations
5. Deployment of missiles

Performance of Government. Please tell me for each issue how you would rate the overall performance of the government. If you think that any of these issues are not a proper concern for the government, please tell me.

Response values: 0 for not a proper concern, 1 for "excellent" to 5 for "very poor."

Likelihood of Group Success

Past Group Success. On this sheet we have indicated what groups have done to try to attain their political goals. Please tell me whether you think they have by and large hurt or helped the cause of the group, regardless of whether you approve of these actions or not.

Response values: 1 for "hurt a lot" to 5 for "helped a lot."

1. When groups have collected signatures
2. When groups have undertaken legal demonstrations
3. When groups have seized buildings
4. When groups have blocked streets or staged sit-ins
5. When groups have participated in confrontations with police or other government authorities

Willingness of Others. Now, thinking more generally about people in your area who have political views similar to your own, would you tell us how many people would be willing to get involved in the following activities?

Response values: 1 for "none" to 5 for "almost all."

1. Seizing buildings
2. Blocking streets or staging sit-ins
3. Collecting signatures for a petition
4. Working with a citizen's action committee

Perceived Personal Influence

Influence through Specific Activities. Here is a list of political activities. Please indicate the extent to which you *personally* could have an influence on politics if you participated in each one.

Response values: 1 for "I would have no influence" to 5 for "I would have great influence."

1. Collected signatures for a petition
2. Worked with a citizen's action committee
3. Participated in an organized effort to solve a neighborhood problem
4. Seized buildings
5. Blocked streets or participated in sit-ins

General Political Influence. I would like to ask you some more questions on general issues. To what extent do you agree or disagree with the following statements?

1. There is no point in getting involved in politics because I would have no influence anyway. Response values: 1 for "strongly agree" to 5 for "strongly disagree."
2. If I were more involved in politics, I would have more influence on what happens. Response values: 1 for "strongly disagree" to 5 for "strongly agree."

Necessity of Group Unity

Now I would like to ask some general questions about political activities. To what extent do you agree or disagree with the following statements?

Response values: 1 for "strongly disagree" to 5 for "strongly agree."

1. Every individual member is necessary for the success of a political group, no matter how large it is.
2. For groups to have a reasonable chance of success by means of political action, everyone must contribute a small part.

Costs of Participation

Trouble with Police, Could Get Hurt, Take Too Much Time

If you were to participate in political action that is *permitted*, e.g., working in an election campaign, collecting signatures for a petition, or taking part in a permitted demonstration, how likely is it that the following will happen?

Response values: 1 for "very unlikely" to 4 for "very likely."

1. I would get into trouble with the police or the courts.
2. I could get hurt.
3. It would take too much of my time.

If you were to participate in political action that *breaks the law*, e.g., blocking streets or damaging property, how likely is it that the following will happen?

Response values: 1 for "very unlikely" to 4 for "very likely."

1. I would get into trouble with the police or the courts.
2. I could get hurt.
3. It would take too much of my time.

Selective Incentives

Financial Gain, Gain Knowledge, Stand Up for Beliefs

If you were to participate in political action that is *permitted*, e.g., working in an election campaign, collecting signatures for a petition, or taking part in a permitted demonstration, how likely is it that the following will happen?

Response values: 1 for "very unlikely" to 4 for "very likely."

1. I would gain financially.
2. I would understand politics better.
3. I would feel good because I had stood up for something I believed in.

If you were to participate in political action that *breaks the law*, e.g., blocking streets or damaging property, how likely is it that the following will happen?

Response values: 1 for "very unlikely" to 4 for "very likely."

1. I would gain financially.
2. I would understand politics better.
3. I would feel good because I had stood up for something I believed in.

Expectations of Others

Think about those people whose opinion is especially important to you, for example, your spouse, friends, colleagues, or other people you know. If you were to participate in political action that *breaks the law*, e.g., blocking streets, sit-ins, or damaging property, what would most of those people think of you?

If you were to participate in political action that is *permitted*, what would most of those people mentioned above think of you?

Response values: 1 for "very negatively" to 5 for *very positively*."

Group Encouragement

Do any of those groups (of which respondent indicated s/he was a member encourage or discourage you to take part in activities like signing petitions or taking part in demonstrations, or don't they care one way or another?

Do any of those groups encourage or discourage you to take part in actions like sit-ins, blocking streets, or don't they care one way or another?

Response values: 1 for "I'm encouraged," 2 for "I'm discouraged," 3 for "group does not care."

Entertainment

Now I would like to ask some general questions about political activities. To what extent do you agree or disagree with the following statements?

Response values: 1 for "strongly disagree" to 5 for "strongly agree."

Being involved in politics is a very enjoyable experience.

Internal Behavioral Norms

I would like to ask you some more questions on general issues. To what extent do you agree or disagree with the following statements?

Response values: 1 for "strongly agree" to 5 for "strongly disagree."

1. If a citizen is dissatisfied with the policy of the government, he has a duty to do something about it.
2. Politics should be left to our elected representatives.
Response values: 1 for "strongly disagree" to 5 for "strongly agree."
3. Violence against *property* in order to achieve certain political goals is morally justifiable.
4. Violence against *persons* in order to achieve certain political goals is morally justifiable.
5. If citizens struggle for important political causes, violating the law may be necessary.

Democratizing for Peace

MICHAEL D. WARD *University of Washington*

KRISTIAN S. GLEDITSCH *University of Colorado*

The argument that democratization can bring about war is a powerful critique suggesting limits to the linkage between democracy and peace. This research examines this claim. Our findings demonstrate that democratizing polities are substantially less war prone than previously argued. By focusing on the characteristics of the transition process, we show that as contemporary polities become more democratic they reduce their overall chances of being involved in war by approximately half. We also find that rocky or especially rapid transitions or reversals are associated with a countervailing effect; namely, they increase the risk of being involved in warfare. Both in the long term and while societies undergo democratic change, the risks of war are reduced by democratization and exacerbated by reversals in the democratization process. To reach these conclusions, we developed and applied a logit model linking authority characteristics and war involvement using Polity III and Correlates of War databases.

Do polities become more peaceful as they democratize? Alternatively, is political change toward greater political democracy associated with increased likelihood of war? Research following Babst's (1964) observation of an apparent absence of a war between democracies has produced considerable empirical evidence for the liberal proposition (Kant [1795] 1991) that democracies rarely if ever fight one another (Bremer 1992, 1993; Maoz and Abdolali 1989; Maoz and Russett 1993; Raknerud and Hegre 1997; Russett and Maoz 1992). Despite substantial variation and healthy debate over the specific causal mechanism linking joint democracy and peace, there appears to be an emerging, if heady, consensus at least on the empirical existence of a "democratic peace" or an absence of war among democracies. In April 1995 the *Economist* (p. 18) summarized this by noting that "it takes two *not* to tango."

Michael D. Ward is Professor of Political Science, University of Washington, Seattle, WA 98195-3530 (mdw@u.washington.edu). Kristian S. Gleditsch is a doctoral candidate in the Department of Political Science and a graduate research trainee in the Globalization and Democratization Program, part of the Program on Political and Economic Change, Institute of Behavioral Science, University of Colorado, Boulder, CO, 80309-0487 (ksg@isere.colorado.edu).

An earlier version was presented at the annual conference of the International Studies Association, Toronto, Canada, March 18–23, 1997. This research is supported by a grant from the National Science Foundation, SBR 9511577. We are grateful for this and for institutional support from the universities of Colorado, Maryland, and Washington. Kristian S. Gleditsch also received the gracious support of the American Scandinavian Foundation. We are grateful to our collaborators, John O'Loughlin, Corey L. Lofdahl, Jordin S. Cohen, David Reilly, and Michael E. Shin, for their support and help in this project. Jonathan Wilkenfeld, David Lalman, Harvey Starr, Christian Davenport, Jeff Kopstein, David John Longenecker, Richard Tucker, and participants in seminars at the University of California at Davis, the University of Colorado, and the University of Washington gave us many helpful comments on an earlier version, as did anonymous APSR reviewers. Randolph Siverson pointed us in the right direction when we were at the crossroads; we thank him for his wisdom.

The research was undertaken in the context of the Globalization and Democratization Program, also supported by the National Science Foundation (EHR 95-53453) and the University of Colorado. Faculty and students in the program have created a splendid interdisciplinary environment that supported our research, and we thank them, especially our faculty colleagues, Richard Jessor, Edward S. Greenberg, and Lynn Staeheli.

Research on the democratic peace has almost exclusively focused on the behavior of pairs of countries. The dyadic character of the unit of analysis applies not only to the issue of conflict (i.e., are the societies involved in a war with each other) but also to the major independent forces often employed to explain the conflict. The dyad is typically classified as being jointly democratic, mixed, or jointly autocratic. Some studies have also used measures of the mean or average level of political democracy in a dyad.¹ When the analysis has rested at this constructed dyadic level, the results have been consistent and have cumulated into what has become known as the democratic peace proposition.

When the unit of analysis is focused on the monadic level of individual states, however, most studies have failed to find strong or significant differences between the war participation of democracies and nondemocracies. While this conclusion has been questioned in some writings (Hewitt and Wilkenfeld 1996; Ray 1995a, 1995b; Rummel 1983, 1985, 1995), the conventional wisdom is that while democracies do not fight one another, they appear to be at least as war prone as other political systems (see, e.g., Dixon 1993, 1994; Morgan and Campbell 1991; Morgan and Schwebach 1992; Russett and Maoz 1993; Singer and Small 1976; but see also Gates, Knutsen, and Moses 1996). Why there is such a divergence between the national and bilateral versions of the idea that democracy leads to a more peaceful foreign policy continues to be puzzling. One early study (Chan 1984) suggested that ethnocentrism is at part to blame for the inference that democracies are by nature peaceful. A recent critique (Spiro 1994) suggests that the first finding is simply a result of having a very rare set of occurrences to study: Unusual (i.e., rare) events involving rare structures (democracies) are especially rare. The issue of whether it is useful to aggregate conflict initiators and targets into a

¹ The use of dyads as the unit of analysis does not require summing the parties' behavior. One alternative is to employ so-called directed dyads, for which the temporal sequence of the specific interaction between the parties is made explicit, e.g., indicating one party as initiator or recipient (see Rousseau et al. 1996, Rummel 1985).

single dyad at war is also viewed as problematic. The probability of participating in a war may also depend upon the number of politically relevant dyads in which a country is involved (Lemke 1995, Maoz and Russett 1993) as well as the regime characteristics of the other countries in these dyads. Relevant dyads are those in which there exists an actual opportunity for war, typically gauged by geographical proximity and/or the density of political interactions.

The conundrum of why democracies apparently do not wage war against one another but are not in general more pacific has failed to spawn a great deal of research. Thompson and Tucker (1997) note that in the past decade there have been more than 100 empirical papers targeted at the peaceful joint democracy proposition. A much smaller number of scholars have looked into why democracies are not considered *sui generis* to be more pacific.² Small and Singer (1976) found no difference between democracies and autocracies in the baseline probability of war involvement. Chan's (1984) research also demonstrated this empirical regularity. Both of the two major explanations of the democratic peace proposition, the normative and institutional, would seem to have broader implications for the putative peaceful nature of the modern polity. This conundrum is so important not only because it calls into question the theoretical underpinnings of the democratic peace hypothesis but also because it may undercut the idealist policy prescription shared by diverse political leaders; namely, widespread democratization will lead to widespread peace.

In this light, recent evidence has emerged that seeks—in part—to reconcile the differences between the bilateral and state-centric versions of Kant's long-standing ([1795] 1991) thesis. Mansfield and Snyder (1995a, 1995b, 1997) suggest that while democracies may eventually become more peaceful than autocratic societies, the transition phase of newly democratic states is especially dangerous. Nascent democracies are thought to be quite likely to become involved in foreign conflict. This is a consequence of the fragile position of the new elite, which is forced to appeal to nationalism in attempts to solidify its tenuous position. Accordingly, there is an increased propensity for war involvement. This may help explain the divergent empirical findings. If democracies are truly more peaceful, except during the very early stages of democratic institutionalization, then the nonpacific nature of democracies may be the result of war proneness in young democracies balanced by the pacific behavior patterns of mature democracies.

The notion that democratizing societies are war prone and conflict laden does call into question, however, whether democracies do in general have norms and institutions that prohibit conflict with other (similar) societies. This, in turn, raises the question of whether, in an era of widespread proliferation of weapons of mass destruction, democratization will

always be easily adjudged a good thing. On the one hand, the absence of a strong monadic link between democracy and peace would not necessarily disprove the dyadic proposition that democracies rarely if ever fight one another. On the other hand, its presence would not put to rest all questions about the validity of the democratic peace. Yet, information about the form and nature of any monadic link would get us closer to answers to these questions. These ambiguities between different levels of analysis suggest that research on the democratic peace proposition may have left unexplored some possible implications of domestic political structure for conflict behavior.

In this article we examine the monadic aspects of the democratic peace proposition by revisiting the question of whether democratizing states are less war prone than autocratic states. Our focus is upon the process of how exactly states become more or less democratically governed. We probe whether this may help explain why democracies apparently are not very likely to wage war with other democracies. In focusing on transitions, we follow the suggestion of Mansfield and Snyder (1995a, 1995b) that immature democracies undergoing rapid institutional change may be more prone to war involvement. We do not systematically examine simultaneous factors that may explain the differing relationships between political structure and conflict behavior found on the various levels of analysis. We ignore the characteristics of other societies. We also do not address the issue of the actual timing of changes in political or institutional arrangements and structures, an unexplored aspect in the extant data on regime characteristics. Instead, we focus on another set of neglected features of domestic political structure with possible implications for conflict behavior: the effects of political transitions and regime change. In short, we reexamine whether democratizing states are more war prone. We also examine whether reversals of the democratization process tend to threaten peace.

THE DANGER OF DEMOCRATIZATION

Many studies of the democratic peace examine the effect of current domestic political structures on war participation.³ Explanations of the democratic peace focus either on the existence of norms that facilitate the peaceful resolution of conflicts (Dixon 1993, 1994; Hewitt and Wilkenfeld 1996; Raymond 1994) or the structural features of democracies that make decision makers more cautious in the use of force (Bueno de Mesquita and Siverson 1995, Morgan and Campbell 1991, Morgan and Schwebach 1992). These include both formal institutional constraints on the executive decision to declare war and various electoral mechanisms that enhance the dependence of executive leaders on popular approval.

Contested elections increase the executive leader's sensitivity to political risk since they may call into question the tenure of the ruling authorities. The fear

² Rousseau et al. (1996) have examined dyadic versus monadic aspects of the democratic peace proposition as it relates to crisis behavior.

³ Exceptions are Rousseau et al. 1996, Thompson and Tucker 1997, and Mansfield and Snyder 1995a, 1995b.

that failure may lead to loss of political power in subsequent elections will ensure some restraint in the use of force. In the same way, legislative approval is an important source of constraint on political leaders. Bueno de Mesquita and Siverson (1997) and Bueno de Mesquita et al. (1997) construct a simple theory based on coalition theory (i.e., Riker 1962) that illustrates these points. They show that democrats are punished more quickly than autocrats for losing wars. Consequently, in the presence of uncertainty about the outcome of a conflict, they are more likely to press for compromise.

The distinction between these competing views is commonly portrayed as a difference between structural and normative explanations of the democratic peace. As illustrated in Bueno de Mesquita et al. (1997), however, the distinctions may be subsumed under a broader theory of what motivates democratic as well as autocratic decision makers.

Many who accept the notion that democracies do not fight one another still consider democratization and political change something of a double-edged sword. While stable, well-established democracies may not fight one another, a possibly rocky process of democratization or transition toward a fragile democracy need not necessarily imply that countries become immediately more peaceful. Indeed, as shown by Lichbach (1984), a smooth transition from low to high levels of democratic governance is the exception, not the rule. Classic sequences from monarchy, through concurrent democratic and autocratic rule, to an overwhelmingly democratic political structure are considered to be "historical rarities" (Lichbach 1984, 77). A full 30% of the historical European cases seem to oscillate between democratic and nondemocratic forms of governance, according to Lichbach's study.

The degree of democratic commitment or time since democratization may be important for explanations emphasizing the role of norms as well as institutions. It is quite plausible that some time may have to pass before democratic norms or informal institutions become sufficiently well established to have the effect of inhibiting conflicts. Some have suggested employing a turnover or two consecutive elections as classification criteria for democracy (Huntington 1991; Ray 1995a, 1995b). This perspective calls into question whether one should expect to find a decreasing likelihood of war attendant to democratic transitions.

Yet, much stronger and more pessimistic claims have been made regarding the effect of democratization on the likelihood of conflict and war. Political instability and change in general are often considered to be associated with increased likelihood of conflict and with possible subsequent escalation and war involvement. Rapid democratization may bring about weak regimes unable to establish effective control and political order. While these new regimes may be less repressive and permit greater political freedom than their precursors, they also are subject to instability and attempts by challengers to seize power. Political instability and disorder may even encourage attacks from

other countries. In fact, stable autocratic regimes may be less prone to conflict and escalation to war than transition regimes. In the same way, political leaders may be more dependent on popular support in young democracies. Absent fully established institutions and civic traditions, these are often considered subject to populist pressures emphasizing the short-term maximization of political support. Democratization often comes bundled with nationalism. In some cases certain groups, typically ethnic minorities, become targeted as second-class citizens and made scapegoats for existing problems. According to some observers, the transition in Eastern Europe has left the population "free to hate." In such circumstances, war often enjoys widespread support among the population. The invasion of the Malvinas/Falkland Islands by Great Britain initially boosted the popularity of the fledgling and increasingly unpopular Argentinean military regime. Populist politicians in struggling democracies may employ external aggression as a way of enhancing political support. The republics of former Yugoslavia provide another example of increased political freedom and external aggression seemingly going hand in hand.⁴

The above discussion suggests two competing hypotheses about the effect of democratization on the likelihood of war. Fortunately, these are nonnested, and evidence can be collected on each of them at the same time. Yet, our belief is that the dangers of democratization are less likely to be borne out in the analysis. Why? Primarily, we think there is a logical, if not necessarily empirical, inconsistency in accounting for the evidence on the democratic peace proposition while maintaining that democratizing states are war prone. If transitions to democracy are dangerous, then newly institutionalizing states will rely *more* on warfare in their foreign policy precisely because decision makers will rely on international violence during an important evolutionary period. That reliance will serve their internal political purposes, in terms of both retention of power and the initial shaping of institutions and norms. If warfare is evolutionarily dominant and successful in states undergoing democratization, it then seems likely that institutions and norms will emerge in a way to reflect this. Evidence of a general (nondyadic) trend of pacific relations in democracies would bolster the view that democracies do not wage war with one another. If democracies—even nascent ones—are more belligerent, however, then this raises considerable doubt about the logical status of a democratic peace. Perhaps that explains the great interest in the recent work of Mansfield and Snyder (1995a, 1995b) by scholars of the democratic peace.

Thompson and Tucker (1997) detail a number of potential weaknesses in the Mansfield and Snyder (1995a, 1995b) research design, and in one replication they conclude that "regime change and war involve-

⁴ The Yugoslav example is complex, since the major conflicts broke out before the breakup of a former state. It is moot whether the Croatian-Serbian conflict qualifies as an interstate war. Furthermore, few consider the self-proclaimed Serb Republic of Bosnia to constitute an existing state. A discussion of Serbia can be found in Gagnon (1994/5).

ment are independent" (p. 450). Similarly, Enterline (1996, 1997) found that democratization has a "negative impact on the likelihood of a state being on the initiating side of a dispute." These studies use slightly different case selection, variable definition, and statistical methods in arriving at differing conclusions. The first efforts in this area have not presented the accumulated, supporting replications that allow sweeping generalizations. It is clear that more work is needed and that the current findings seem especially fragile.

We are also persuaded that both norms and institutions may be said to produce greater caution in democrats than in autocrats. Because of swift and almost certain penalties for foreign policy failures in democracies, democratic leaders are likely to be cautious in the face of uncertainty. In representative forms of democracy, since legislatures must support foreign policy initiatives, there is an additional pressure for cautious, slow decision making that avoids conflict when faced with uncertainty. Empirical evidence is quite clear that even victories in war rarely enhance a leader's prospect of prolonging tenure (Bueno de Mesquita, Siverson, and Woller 1992). The incentives for war involvement are thus generally lower in democratic than nondemocratic countries. What is unclear is whether these pressures are muddled in the process of democratic (or autocratic) change.

Our research seeks to gain more information about this question by focusing on three aspects of regime change: direction, intensity, and nature. Is the direction of change toward or away from a greater level of democratic institutionalization? Is the modification in the structure of governance small or very large? Change from a monarchy to direct presidential elections by universal adult suffrage is substantial, whereas the shift from suppressed to restricted political participation is less so. Finally, is the change smooth or variegated? Since we know from Lichbach's (1984) study that smooth, linear change from autocratic to democratic forms of government is historically rare, it is important to find out whether some oscillation occurs or frequent reversals are evident. If the dangerous democratization argument is correct, then it is especially in turbulent situations that one would expect to find war-prone democracies.

We formulate this as a probability problem: Are states in transition, especially democracies, more likely to be involved in interstate wars? We choose to model this problem as logistic probability equation. We choose this form because it allows us to make reasonable statements about the probabilities of war behavior associated with certain trajectories of democratic change. The resulting direct and accessible model can be applied to a dependent variable that is binary, such as war involvement. Basically, we want to know the probability of a polity being involved in an interstate war at a given time based on its authority characteristics and how these have changed over the previous ten years. This is expressed as a logistic equation:

TABLE 1. Authority Characteristics and Democracy and Autocracy Scale Values in the Polity III Database

Authority Dimensions	Democracy "Points"	Autocracy "Points"
Competitiveness of political participation		
Competitive	3	0
Transitional	2	0
Factional	1	0
Restricted	0	1
Suppressed	0	2
Not applicable	0	0
Regulation of political participation		
Regulated	0	0
Factional or transitional	0	0
Factional/restricted	0	1
Restricted	0	2
Unregulated	0	0
Competitiveness of executive recruitment		
Election	2	0
Transitional	1	0
Selection	0	2
Openness of executive recruitment		
Election	1	0
Dual: Hereditary and election	1	0
Dual: Hereditary and designation	0	1
Closed	0	1
Constraints on chief executive		
Parity of subordination	4	0
Between parity or subordination and substantial limitations	3	0
Substantial limitations	2	0
Between substantial limitations and slight to moderate limitations	1	0
Slight to moderate limitations	0	1
Between slight to moderate limitations and unlimited		
Power	0	2
Unlimited power	0	3
Total scores	Σ	Σ

Note: Democracy and autocracy scores are simply the summation (Σ) of points from all of the authority dimensions. Following Jagers and Gurr (1996) no democracy points are given for the absence of regulation of political participation which is taken to represent anarchy.

$$P_i = E(W_i = 1 | A_i + A_i^d + A_i^m + A_i^v),$$

where W_i denotes conflict involvement, A_i represents the authority characteristics (i.e., $A_i \in \{\text{Democracy, Democracy minus Autocracy, Executive Constraints}\}$, and the superscripts $\{d, m, v\}$ refer, respectively, to the direction (the absolute value of the change over the ten years), the magnitude (the actual change over the ten years), and the variance (over the ten years) of change in A_i . The authority characteristics are defined in Table 1. The probability of war for a given observation has the following logistic form⁵:

⁵ The log-odds form (known as the logit model) is linear in variables

TABLE 2. Definitions of Independent Variables

Variable Label	Definition	Description
Current value (in nation <i>i</i> at time <i>t</i>)	$X_{i,t}$	The current value of the regime characteristics
Direction of change (in nation <i>i</i> between time <i>t</i> and <i>t</i> - 10)	$X_{i,t} < X_{i,t-10} \Rightarrow -1$ $X_{i,t} = X_{i,t-10} \Rightarrow 0$ $X_{i,t} > X_{i,t-10} \Rightarrow +1$	Positive, if the change is toward democratic regime characteristics; negative, if the change is toward autocratic regime characteristics; zero, if there is no change
Change (in nation <i>i</i> between time <i>t</i> and <i>t</i> - 10)	$X_{i,t} - X_{i,t-10}$	The signed, magnitude of change in regime characteristics, positive for democratic change
Variance of change (in nation <i>i</i> between time <i>t</i> and <i>t</i> - 10)	$\frac{1}{10} \sum_{t=1}^{10} \left(X_{i,t} - \frac{1}{10} \sum_{t=1}^{10} X_{i,t} \right)^2$	Large values indicate rapid change and/or changes that go back and forth between democratic and autocratic characteristics

$$P_i(\text{War} = 1) = \frac{1}{1 + \exp^{-(\beta_0 + \beta_1 A_i + \beta_2 A_i^d + \beta_3 A_i^m + \beta_4 A_i^v)}} \quad (1)$$

This simple model is quite different in some respects from most other efforts. First, our choice of independent variables focuses entirely on the transition process. Many other studies include only changes exceeding some specific magnitude or use dichotomous categories (i.e., change versus no change) over some period. These categorizations of political change risk being arbitrary. The mere existence of change is not by itself an adequate measure of democratization. Unlike those who conceive of democracy as an all-or-nothing affair, we think of democratization and political change as movements (though not necessarily smooth) along a continuum and examine the amount, direction, and variance of change along that continuum.

We believe that greater change toward democracy will be associated with a decreasing likelihood of war, while minor steps toward political democracy and cosmetic changes will exercise less effect on the avoidance of war. Political change or democratization can take many different forms, however, and need not proceed in a unidirectional or linear fashion. Our position contrasts with that of much of the literature, which claims that large or rapid change toward democracy often tends to be associated with greater instability and higher risk of reversal (e.g., Huntington 1984, 1991). The implication is that gradual changes involve a smaller likelihood of war than does rapid democratization. Furthermore, we posit that greater variability of political change within a country's political system will be associated with a higher likelihood of war. Accordingly, we focus on the moments of the distribution of change in authority characteristics, including the direction, magnitude, and variance, along with the actual current values.

and parameters, but it is even more difficult to interpret than estimated probabilities:

$$\ln\left(\frac{P_i}{1-P_i}\right) = \beta_0 + \beta_1 A_i + \beta_2 A_i^d + \beta_3 A_i^m + \beta_4 A_i^v.$$

Such a specification is novel in the literature, but it allows us to glean more details about the democratization process and how, if at all, it relates to the probability of being involved in a war. Unstable democratic transitions should exhibit a high degree of variance in their democratization scores. Countries moving quickly should exhibit a large value for the magnitude of change, but societies slow to democratize should exhibit a small magnitude of change, with low variance, over time. The next section describes the data, methods, and results from an empirical examination of the issue of whether democratization increases the risk of war.

EMPIRICAL EVIDENCE

Data

For assessing authority characteristics, we employ the 5.1996 version of the Polity III database (Jaggers and Gurr 1996). A more complete description of these data may be found in Gleditsch and Ward (1997), Gurr (1974), Gurr, Jaggers, and Moore (1989, 1990), and Jaggers and Gurr (1995). The data are more current than those available previously, with information on polities through 1994. In addition, a number of important revisions have been undertaken in the 5.1996 version, which are detailed in the web site (<http://www.colorado.edu/IBS/GAD/spacetime/data/Polity.html>). Most important are the corrected democracy scores of nineteenth-century monarchies and the inclusion of transition codes. Table 1 gave in tabular form the coding rules for assigning democracy and autocracy scale values in the Polity III framework. Table 2 provides the definition for each of the independent variables constructed from these values and employed in equation 1.

From these data and definitions we are able to calculate democracy scale values $\{D\}$; democracy scale values minus autocracy scale values $\{D - A\}$; the extent of constraints on the executive decision maker

{C}; and the direction—coded positively for movements toward democracy—and magnitude of change as well as the variance over the previous ten years in the above three variables, represented by the superscripts d , m , and v , respectively.⁶

Take for example the case of Argentina, which suffered a military coup d'état in 1966. As a result, its competitiveness of political participation moved from transitional to suppressed, resulting in a reduction of two democracy points and an increase of two autocracy points, the regulation of participation does not change, the competitiveness of executive recruitment changed from election to selection (with an attendant reduction of two democracy points and a gain of two autocracy points), the openness of executive recruitment remained the same, and the constraints on the chief executive were slight before the coup and unlimited thereafter (the democracy score does not change as a result of this, but Argentina gained two autocracy points). Taken together this set of changes resulted in the democracy score moving from 3 to 0, while the autocracy score rose from 4 to 9, and the democracy minus autocracy score moved from -1 to -9. During 1966, the direction of changes were toward autocracy (i.e., had a -1 value), the actual magnitude of change in democracy minus autocracy was -8, and the variance of change over the past ten years was calculated to be 6.4, a rather low value.

In 1983, Argentina experienced a return to more democratic forms of governance: When Raúl Alfonsín replaced the military junta, the democracy minus autocracy score moved from -8 in 1982 to +8 in 1983. This reflected change in the competitiveness of political participation, which moved from restricted to factional (leading to an increase of one democracy point and a decrease of one autocracy point), the regulation of political participation changed from restricted to factional or transitional (leading to a decrease in the autocracy score by two points), the openness of executive recruitment remained unchanged, the competitiveness of executive recruitment changed from selection to election (with a resulting increase in the overall democracy score by two points and a reduction of two for the autocracy score), and the extent of constraints on the chief executive went from a previous situation of unlimited power to parity or subordination (thereby yielding an increase of four democracy points, and reducing the autocracy score by three points). In this instance, the direction of change is positive (i.e., toward greater democracy) and the magnitude of change is large (17), while the variance of change over the prior highly unstable decade was calculated to be 55.66.

Two available Correlates of War (COW) databases address a similar spatial and temporal frame: the International War (COW-IW) (Singer and Small 1994, also described in Small and Singer 1982) and the

Militarized Interstate Dispute (COW-MID version 2.0) (Gochman and Maoz 1984; Jones, Bremer, and Singer 1996). Yet, there are substantial differences between the two. COW-IW encompasses wars among member states in the international system as well as among those states and extrasystemic organizations or movements. Any conflict with more than 1,000 battle deaths is classified as a war. The extrasystemic category largely consists of colonial and/or imperial wars. COW-MID is more inclusive, focusing on "cases in which the threat, display or use of military force short of war by one member state is explicitly directed towards the government, official representatives, official forces, property or territory of another state" (Jones, Bremer, and Singer 1996, 168). This excludes extrasystemic wars. Mansfield and Snyder (1995a, 1995b, 1997) analyzed the democratization and war hypothesis by including extrasystemic wars, based on the rationale that nationalist aggression and diversionary use of force may lead to involvement in imperial and colonial wars outside the state system. Since wars are relatively rare, many analysts have examined the relationships between regime characteristics and conflicts that are well below the threshold of 1,000 battle deaths. The issue of whether available theories would pertain to weaker forms of conflict is disputed, however (Chan 1997, Enterline 1996, Gochman 1996).

The COW-MID database is considered by some to be more current and reliable than COW-IW. The theoretical criteria for inclusion are the same, and except for some minor revisions, analysts should expect the two databases to have nearly identical entries (except for the exclusion of extrasystemic events). No codebook is yet available for COW-MID, but a recent article (Jones, Bremer, and Singer 1996, 171) quotes the Small and Singer (1982) criterion of 1,000 battle deaths as a threshold for interstate war. We have not found the similarities between the two databases to be overwhelming. There are many important differences. Some nation-war-years found in COW-IW are not found in COW-MID (e.g., France in 1942–43). Some nation-war-years in COW-IW are classified as "display of force" in COW-MID (among others, China and Vietnam in 1985, Italy in 1912, and Kuwait in 1991). As many as 185 (nation-) war-years in COW-MID are not found in COW-IW. Small and Singer (1982, 55) make certain restrictions in order for individual country involvement to qualify as being "at war." Specifically, a member state either must suffer a minimum of 100 fatalities or have a minimum of 1,000 armed personnel engaged in active combat. Jones, Bremer, and Singer (1996) do not mention this issue, but COW-MID includes a separate coding of the specific level of hostility reached in a given country's dispute involvement. Excluding cases of participation at a level below interstate war reduces the discrepancies to 92 war-years. The major share of these seem to stem from different starting years. COW-MID typically assigns a more comprehensive coding; for example, it has the duration of the Mexican-American war as 1843–48,

⁶ Following Mansfield and Snyder (1995a, 1995b), we use a ten-year period of change in democratization to explore its effect on the probability of conflict. We also estimated the model using windows of thirty and five years (the latter to follow Thompson and Tucker's [1997] use of a five-year window). These provide essentially the same information as the ten-year windows.

TABLE 3. Two Sets of Empirical Estimates of Logit Models of the Probability of War Based on Authority Characteristics

Independent Variables	Democracy Scale		Democracy minus Autocracy	
	Estimated Coefficient	Standard Error	Estimated Coefficient	Standard Error
Intercept	-2.528	.049	-2.510	.039
Current value	.012	.010	-.004	.006
Direction of change	.277	.119	.190	.091
Change	-.100	.029	-.030	.013
Variance of change	.016	.011	.008	.003
Likelihood ratio χ^2	14.58	$p = .006$	11.81	$p = .018$
Number of cases	10,681		10,681	

compared to 1846–48 for COW-IW.⁷ This information could be mined to help reduce the discrepancies, but there are 162 conflict-years in COW-MID without country-specific involvement values.

We use COW-IW here because it is more conservative in coding war involvement—our main dependent variable—and because it includes extrasystemic wars, which are especially pertinent to the hypothesis of the dangers of democratization. Thus, we have used the most recent version of the COW database to ascertain whether each polity was involved in an interstate or extrasystemic war during each year from 1815 to 1992. We call this variable *war involvement*, denoted $\{W\}$. We coded countries as being at war in years in which they were classified by COW (Singer and Small 1994) as parties to one or more interstate or extrasystemic wars.⁸ Data from Polity III (May 1996 version) and COW were merged to provide annual observations on each independent polity from 1815 to 1992. We estimate the model given in equation 1 with these data.⁹

Estimation and Results

Table 3 gives the results of two logit estimations of equation 1. These suggest that the direction, magnitude, and variance of change are important in determining the log-odds of a polity being at war. Focusing first on the democracy scale and democracy minus autocracy results (which are substantively equivalent), we find that the current level is not especially important, but the direction and magnitude of change are

both strongly related to the log-odds of being at war, although these two effects are of opposite sign.¹⁰ Changes toward greater democratization are associated with significantly greater log-odds of war involvement, a finding consistent with the dangerous democratization thesis put forward by Mansfield and Snyder (1995a, 1995b) and others. Yet, the actual magnitude of that change is also important as a predictor of war involvement, with larger changes toward democracy associated with *smaller* probabilities of war involvement. The latter result is not consistent with the findings of Mansfield and Snyder (1995a, 1995b, 1997). When one focuses only on whether a change occurs, greater democratization appears to enhance the probability of war involvement, whereas examining the extent of those changes reveals that the probability is reduced. Averaging these two effects may lead to the conclusion in some studies that there is no effect, a finding reported in Thompson and Tucker (1997).

It seems important to look at the cumulative, integrated effect of the direction, magnitude, and variance of change on the probability of war. Examining the logit results independently may be misleading, since these three variables do not vary independently; they are mathematically related. For example, if there is no change over a decade, the magnitude of change is zero, as is the variance. Although many possible combinations of these variables are possible, they are not completely independent. Moreover, these log-odds ratios are not especially easy to interpret in substantive terms, though they are positively related to the probability of war involvement.

What does this mean about the probability of being at war? Rather than present another table, we calculate the probabilities for the dependent variable as a function of some scenario involving the independent variables. For example, Figure 1 uses the empirical estimates from Table 3 and equation 1 to illustrate what happens if a country moves smoothly (at mean levels) from a low level of democratization (democracy scale

⁷ While there was a border dispute during this period, it seems overly inclusive to code the 1843–45 period as a war between the United States and Mexico. The annexation of Texas occurred in late December 1845, and Taylor's "invasion" was in April 1846.

⁸ Since the COW definition pertains primarily to properties of the conflict rather than characteristics of the individual states' participation, the criteria for war involvement on the monadic level can be ambiguous. A country may be classified as participating in a war while its own involvement remains low and few or no casualties occur. Alliance commitments with the warring societies may lead countries to declare war but not actively enter the conflict. Other countries may be involved in conflict and suffer battle-related deaths but not be classified as being at war if the overall level of violence does not reach the 1,000 threshold.

⁹ We use SPLUS™ version 3.4 running on a SUN™ SPARC™ 5 running Solaris™ 2.4 for the analysis reported here; these results have been replicated using LIMDEP™ 7.0 running under MS-DOS™ 6.0 and SPLUS™ for Windows version 3.3.

¹⁰ Based on these results and equation 1, prototypic democracies that do not change over ten years, for example, have a probability of being at war of 0.07, while prototypic autocracies have a corresponding probability of 0.08. This underscores the relative unimportance of the current regime characteristics. It should be pointed out, that the model was developed to assess the importance of changes in regime characteristics.

FIGURE 1. Estimates of the Probability of War Attendant to Democratization

Note: Empirical estimates in Table 3 applied to equation 1 as democracy score moves smoothly from 1 through 10.

of 1) to a high level of democracy (with a scale value of 10). The scenarios preserve the mathematical relationships among the independent variables. We examine the process of democratization and construct scenarios in which there is a transition of the authority characteristics over ten years. We look at democratization as well as "reversal." We present these results graphically in Figure 1, which displays the estimates of the probability of war involvement for societies undergoing democratic change. This yields the marginal changes in probabilities due to changes in the underlying process of democratization.

As Figure 1 details, democratization—whether in mild or strong degrees—is accompanied by reduction, not increase, in the risk of war. Though we do not present graphs of the converse, changes toward autocracy and reversals of democratization are accompanied by increased risks of war involvement. These risks are proportionally greater than the decline or benefits of further democratization. Thus, there is strong evidence that democratization has a monadic effect: It reduces the probability that a country will be involved in a war. Although the probability of war involvement does not decrease linearly, it does decrease monotonically, so that over the entire range of democracy minus autocracy values, there is a reduction of about 50%. During the democratic transition, at every point along the way as well as at the end points, there is an attendant reduction in the probability of a polity being at war.

We also find that reversals toward greater levels of autocracy (not shown) not only increase the probability of war involvement. Apparently, it is more dangerous to be at a given level of democracy if that represents an increase in the level of authoritarianism than it is to be at the same level of democracy if that represents a decrease in the authoritarian character of the regime. Stated differently, reversals are riskier than progress.¹¹

¹¹ Recent work by Rousseau et al. (1996) has questioned the appropriateness of using summed measures of dyadic behavior such as war involvement for testing possible monadic effects of authority structures. It is maintained that a crucial distinction must be made between the use of force in response to aggression and the initiation

TABLE 4. Empirical Estimates of Logistic Model of the Probability of War Based on Executive Constraints

Independent Variables	Executive Constraints	
	Estimated Coefficient	Standard Error
Intercept	-2.663	.068
Current value	.043	.015
Direction of change	.229	.133
Change	-.110	.044
Variance of change	.07	.022
Likelihood ratio χ^2	21.89	$p = .0002$
Number of cases	10,681	

Note: These results are based on the executive constraints variable defined in Table 1. The range for the variable is [1,7]

It has been argued that institutional constraints are theoretically important in translating the effect of democracy into foreign policy (Bueno de Mesquita, Siverson, and Woller 1992; Siverson 1995). If the idea of *democracy* is separated into its major components, then the degree of executive constraints empirically dominates the democracy and autocracy scales (Gleditsch and Ward 1997). Accordingly, we demonstrate that moving toward stronger executive constraints also yields a visible reduction in the risk of war.

Table 4 presents the empirical findings from estimating the basic model using the executive constraints variables on the right-hand side of equation 1. These results are largely consonant with those found for the democracy and democracy minus autocracy scales presented in Table 3 but are much stronger in two respects. First, the overall model is more statistically distinct, with a probability of type II error at least one order of magnitude smaller (likelihood ratio $\chi^2 = 21.89$, $p = .000$). Second, and more important, the direction of change variable is not significant, but all other variables in the model are strongly significant. The current value of executive constraints is shown to put upward pressure on the log-odds of being involved in war, while the magnitude of change toward greater executive constraints dampens the probability. As in the case for the democracy minus autocracy scale, the variance is strongly significant and has the effect of substantially increasing the likelihood that a polity will be at war.¹²

These results also suggest that Mansfield and Snyder (1995a, 1995b) may not have the story completely right but have not completely missed the boat. Democratic change, particularly increased constraint on chief executives, has a compound and confounding effect. Rocky changes toward democracy in general (or autocracy,

of force. While we consider the problem of identifying the conflict initiator troublesome—especially in protracted conflicts—supplementary tests for effects of democratization on the initiation of war nevertheless may provide additional evidence for evaluating our conclusions. We find that the likelihood of war initiation is reduced by more than 75% as countries move from a prototypic autocracy to a prototypic democracy, and it drops to less than 1% as polities reach higher values on the democracy minus autocracy scale.

¹² We find virtually identical results for the analysis of war initiation with executive constraints.

FIGURE 2. The Probability of War Attendant to Changing Executive Constraints

Note: Empirical estimates in Table 4 applied to equation 1 as executive constraints move smoothly from 1 through 7.

for that matter) appear to heighten the likelihood of war involvement. Yet, *sui generis*, changes toward greater democracy via increased executive constraints appear to reduce the risk of war. The total effect of these forces is displayed graphically in Figure 2, which illustrates that if a polity moves from having no constraints on the executive decision maker (i.e., a value of 1.0) to a position of parity or subordination with the legislature (a value of 7.0), the probability of being involved in an interstate war is reduced by one-third, from about 9% to about 6%. This sheds light on precisely what aspect of democratization may reduce the probability of war: shared power between the executive and legislature, each largely staffed by officials pressured by public opinion. To the extent that changes toward democracy bring with them constraints on the executive branch of government, the attendant reduction in the risk of war appears quite robust.

How does the smoothness of the transition toward democracy or autocracy affect these conclusions? We find that transitions with periods of substantial changes toward and away from democracy are marked by an increased risk of war. Smooth transitions tend to be associated with a considerably lower risk. Figure 3 shows these results based on empirical estimates from Table 2, using the democracy minus autocracy scale. Democratic countries with the highest variance in authority characteristics over time have a risk of war approximately twice that of democracies without much variance.¹³ This temporal investigation of the scope and extent of regime change allows us to understand two sets of competing findings. On the one hand, as countries become more democratic, other things being equal, they become more peaceful. On the other hand, if they experience setbacks as well as progress on the "road to democracy," then they are more likely to be involved in warfare along the way. At issue, apparently,

¹³ Examples of countries with high variances include Argentina during the 1970s and 1980s, Guatemala during the 1960s, Austria before the World War II, Nigeria in the 1980s, and both Greece and Turkey during the post-1945 era.

FIGURE 3. The Probability of War Attendant to the Instability of Regime Change

Note: Empirical estimates in Table 3 applied to equation 1 as the variance of regime change (democracy minus autocracy) moves from 1 through 100 for the case in the middle of the scale moving quickly toward complete democracy.

is not the rapidity of change toward democracy but the linearity of the process. Smooth monotonic transitions are associated with the least risk and greatest benefit. Reversals, even in the short term, have the greatest risk. Prior analyses that did not focus on the process of transition could not discover these nuances.

CONCLUSION

Our results show that the process of democratization is accompanied by a decrease in the probability of a country being involved in a war, either as a target or as an initiator. These results were obtained with a more current (and corrected) database than was used in earlier work, and our analyses also focus more clearly on the process of transition. In comparison to studies that look only at the existence of change in authority characteristics, we examine the direction, magnitude, and smoothness of the transition process.

It is necessary to temper these results, however. First, our focus on the transition process excludes other important aspects of domestic and international politics that may affect the probability of being at war. We have not presented a complete framework. Although our model passes conventional statistical muster, it should not be used as a predictive model of war. We can correctly predict more than 90% of the outcomes, but all relate to the absence of war, the mode. War is rare, of course, and the predicted probabilities associated with these cases are higher, but they do not approach the 0.50 level that would be a minimum for predicting the presence of a war.¹⁴

Furthermore, our logistic analyses cannot rule out temporal or spatial effects that may outweigh the linkages we found between democratization and the propensity for war involvement. We know from other studies that both war involvement and democratization exhibit temporal as well as spatial patterns that are not

¹⁴ Nevertheless, the highest estimated probabilities are generally associated with cases in which there was a war involvement.

random. Statistical techniques for separating these effects and controlling for them in logistic models are not available. Indeed, it is necessary to transform the problem into a survival analysis with a spatial component in order to address these concerns more directly. That is a point of departure for future research but is a weakness in the current study.

Moreover, our focus on the monadic aspects of changes in regime characteristics ignores the strongest findings of the democratic peace literature. As a result, we have not examined the potentially powerful hypotheses that posit *joint* effects of democracy, common interests and alliances, the balance of capabilities, economic interdependence, and international commerce. Yet, by concentrating on the transition argument alone, we lose any traction that may be gained from these notions as well. In the same way, by focusing on democratization, we avoid generalizing about the causes of war. All these issues undoubtedly are important, and each is receiving considerable attention in the literature. Our purpose here was not to bring any evidence to bear on these ideas. Instead, we chose to look at whether democratizing states are more war prone than others.

Despite these limitations, our study makes a valuable contribution to knowledge about the linkages between democratization and conflict. We find evidence of a heightened propensity for war involvement in certain patterns of democratization and a diminished likelihood in others. Our analysis shows how the dangerous democratization thesis may be modified to be more consistent with the data. In particular, some aspects of democratization appear to increase the likelihood of war, as initially suggested by Gagnon (1994/5) and pursued by Mansfield and Snyder (1995a, 1995b, 1997). At the same time, it appears that the broad and overall effect of democratization is to promote peace.

Strong images support the notion of dangerous democratization. One is that of an incapacitated Russian leader faced with a welter of nationalist competition. The small bandage placed over the gaping wound in Grozny may be perceived as a opportunity that motivates a democratic consolidation. The conflict in the Balkans is often offered as stylized evidence that democratization is not only fragile but also dangerous. Events in Eastern and Central Europe have spawned considerable speculation about the dangers of democratization (e.g., Mansfield and Snyder 1995a, 1995b). Typical examples are Serbia, Croatia, Armenia, and Azerbaijan. Nevertheless, while these regimes may enjoy considerable popular support, it seems dubious whether they may accurately be characterized as democracies.¹⁵ These were not independent countries before 1991, and it is hard to say how democratiza-

tion—even if it is under way—can be separated from the process of state building and institutionalization. It is appropriate to question whether these examples are typical at all.¹⁶ Many conflicts in the area have been predicted but have failed to materialize (e.g., Hungary versus Romania, Russia versus Ukraine, Poland versus Lithuania, Russia versus the Baltic Republics). Even the stylized facts are quite complicated and do not necessarily lead to the conclusion that newly emergent democracies are war prone. Indeed, not every political change is toward greater institutionalization of democratic norms and practices.

The democratic peace hypothesis has maintained that democracies do not go to war against other democracies. The dangerous democratization hypothesis has suggested that emergent democracies may be quite prone to international violence, largely because of “deformed” institutional forces. Our research does not rule out such an outcome, but it does demonstrate that democratization generally proceeds in a way to reduce the risk of war. It also shows that there is little statistical evidence to suggest that the movement toward more democratic practices renders the state more dangerous to international peace *unless* that transition is rocky and involves reversals along the way. Thus, it appears that the safest conclusion from these analyses is that democratic *reversals* increase the likelihood of warfare.

¹⁶ In their reply to Thompson and Tucker (1997) in the *Journal of Conflict Resolution*, Mansfield and Snyder (1997) list a number of cases to which they believe their model applies, including Rwanda in the 1990s. It is dubious whether these cases are consistent with their hypothesis that democratization and not autocratization may lead to war. It is hard to see how Rwanda can be classified as a democratizing regime. Many forms of political instability can be identified—domestic conflict, political violence, labor unrest—as having the potential to induce external conflict, but a regime losing control does not necessarily constitute democratization.

Constructing a Supranational Constitution: Dispute Resolution and Governance in the European Community

ALEC STONE SWEET and THOMAS L. BRUNELL, *University of California, Irvine*

We present a theory of European legal integration that relies on three causal factors: transnational exchange, triadic dispute resolution, and the production of legal norms. After stating the theory in abstract terms, we explain the construction of the legal system and test the relationship among our three variables over the life of the European Community. We then examine the effect of the EC legal system on policy outcomes at both the national and supranational levels in two policy domains: the free movement of goods and gender equality. Our theory outperforms its leading rival, intergovernmentalism. The evidence shows that European integration has generally been driven by transnational activity and the efforts of EC institutions to reduce transaction costs, behavior which governments react to but do not control.

No international organization in world history has attracted as much scholarly attention as the European Community (EC).¹ The reason is straightforward: The EC has evolved from a relatively traditional (albeit multifaceted) interstate system into a quasi-federal polity. In a word, Europe has *integrated*, as the linkages between politics on the EC level and politics on the national level have expanded in scope and deepened in intensity. Scholars working in diverse fields, including public law, international relations, and comparative politics, have been fascinated by the integration process, not least because of the challenge of understanding the reciprocal effect, over time, of international and domestic systems of governance.

Current theoretical disagreements about how to understand European integration are largely disputes between intergovernmentalists, whose imagery is drawn from the international regime literature (Garrett 1992; Keohane and Hoffmann 1991; Moravcsik 1991, 1993; Taylor 1983), and supranationalists, whose imagery is often federalist (Burley and Mattli 1993; Leibfried and Pierson, eds., 1995; Marks, Hooghe, and Blank 1996; Sandholtz 1993, 1996; Sbragia 1993; Stone Sweet and Sandholtz 1997). Intergovernmentalists accord relative priority to member state governments—representatives of the national interest—who bargain with one another in EC fora to fix the terms and limits of integration. Supranationalists (especially the heirs of neofunctionalism), accord relative priority to EC institutions—representatives of the interests of a nascent transnational society—who work with public and pri-

vate actors at both the European and national levels to remove barriers to integration and to expand the domain of supranational governance. This paper is implicated in these disputes. One of our claims is that, on crucial points, the intergovernmentalists have gotten it wrong.

More important, we propose a theory of European legal integration, the process by which Europe has constructed a transnational rule-of-law polity. The theory integrates, as interdependent causal factors, contracting among individuals, third-party dispute resolution, and the production of legal norms. We test the theory, with reference to the EC, in two stages. First, we explain the construction of the legal system, and analyze the relationships among our three key variables over the life of the EC. Second, we examine the effect of the operation of the legal system on governance, that is, on policy processes and outcomes, at both the national and supranational levels.

CONTRACTING, DISPUTE RESOLUTION, AND LAWMAKING

Our theory relies on three analytically independent factors that we expect to be interdependent in their effect. Because we believe the theory has general application (it helps us understand how all rule-of-law governmental systems may emerge and develop), we present it in an abstract form here. It has been elaborated more formally elsewhere (Stone Sweet n.d.)

The first factor is a simple contract—an exchange relationship—between two persons. Contracts, which are codified promises, fix the rules for a given exchange by establishing the rights and obligations of each contracting party with respect to the other. The contract is an inherently social institution, embedded in a cultural (or normative) framework that enables individuals not only to conceive, pursue, and express their interests and desires but also to coordinate them with those of others. Furthermore, to get to the very notion of a codified promise we must have language, notions of individual roles, commitment, reputation, and responsibility (which have no meaning outside a social setting) as well as some set of collective expectations about the future. As exchange proceeds over the life of the contract, or as external circumstances change, the

¹ Although "European Union" is now commonly used to denote the European polity, we use "European Community" throughout. Formally, the EC remains distinct from the EU, and the EC is the most inclusive term for how the organization and its legal system function most of the time.

meanings attached to the same set of rules by the contractants may diverge. To the extent that such conflicts arise, contracting generates a social demand for third-party dispute resolution, for law and courts, the function of which is to sustain social exchange over time.

The second factor, then, is effective triadic dispute resolution. Without it, the costs of exchange may be prohibitive, since each prospective party may doubt that the other will abide by promises made over the life of the contract. A judicial system lowers these costs, providing a measure of certainty to each contractant and a means of reconsecrating the terms of the contract over time, given the certainty that differences in interpretation will arise as unforeseen circumstances arise. Transaction costs are particularly high in situations in which strangers—those who do not share a common normative framework (whether cultural or legal)—contemplate exchange and no effective triadic dispute resolution exists.

The triad—two disputants and a dispute resolver—constitutes a basic, probably primal, institution of governance (Simmel 1950, 145–69). In every human community about which we know anything, we find such triads, arrayed along a spectrum that stretches roughly from consent-based mediation to arbitration to coercive-adjudication. Commonly, triadic dispute resolution performs profoundly political functions, including the construction, consolidation, and maintenance of political regimes (Shapiro 1980, chapter 1), functions that inhere in the lawmaking dynamics of dispute resolution itself.

Consider formal adjudication, wherein judges are required, for legitimacy purposes among others, to provide legal reasons to support their decisions. When a judge decides, the lawmaking effect of the decision is always twofold. First, in settling the dispute at hand, the judge produces a legal act that is particular (it binds the two disputants) and retrospective (it resolves an existing dispute). Second, in justifying the decision, the judge signals that she will settle similar cases similarly in the future; this legal act is a general and prospective one (it affects future and potential contractants). Thus, judges do not simply or only respond to demands generated by social exchange. Rather, they adapt, continuously, the abstract legal rules governing exchange in any given community to the concrete exigencies of those individuals engaged in exchange.

The third factor is legislating, the elaboration of legal rules. Rules facilitate and also structure exchange by restricting some practices while permitting others. Conceived in this way, the legislator serves a social function rather similar to that of the judge: both produce rules that serve to reduce the transaction costs, enhance the legal certainty, and stabilize the expectations of those engaged in or contemplating exchange. Legislating, of course, is a far more efficient means of coordinating activity than is case-by-case adjudication and rule making. But because legal norms are so efficacious (immediately binding on broad classes of people and activities), their production poses a collective action problem. Partly for this reason, and

partly due to the dynamics of judicial rule making, judges may legislate on matters before legislators do. In any case, in polities that possess both a permanently constituted legislature and an independent judiciary, lawmaking powers are shared, and boundaries allegedly separating institutional functions blur. Thus, legislatures rely on the legal system to enforce its law; and the judiciary possesses broad capacity to generate legal rules where none existed prior to a given dispute as well as to reconstruct legislative norms in interstitial processes of interpretation.

Viewed in dynamic relation to one another, contracting, triadic dispute resolution, and legislating can evolve interdependently and, in so doing, constitute and reconstitute a polity. Thus, as the number of contracts rise, the legal system will increasingly be activated. To the extent that the legal system performs its dispute-resolution functions effectively, it reduces contracting costs, thus encouraging more exchange. As the scope of legislation widens and deepens, the conditions favoring the expansion of exchange are constructed, the potential for legal disputes increases, and the grounds available for judicial lawmaking expand. New collective action problems are posed as older barriers to exchange are removed, and these problems push for normative solutions.

Components of the virtuous circle just described have been identified empirically and theorized by scholars working in diverse fields. North (1981, 1990) argues that differential rates of national economic development are in large part explained by the relative effectiveness of legal systems to reduce the costs of exchange among strangers. Although they did not focus on law and courts, Haas (1958, 1961) and Deutsch (1957) understood, somewhat differently, that sovereign states will respond to increasing levels of transnational interaction by integrating politically, that is, by creating common institutional and normative frameworks that in effect give birth to new systems of transnational governance. Haas used the term “spillover” to capture the expansive logic of integration. In their studies of the birth and subsequent development of legal systems, Kommers (1994), Landfried (1984, 1992), Stone (1992, 1994b), and Burley and Mattli (1993) show that tight linkages can develop between self-interested litigants and judges; these interactions generate a self-sustaining dynamic, which by feeding back into the greater political environment can reconfigure the inner workings of the polity itself. These sorts of “policy feedbacks,” and their political consequences, are also familiar to historical institutionalists, who give them pride of place (Pierson 1993; Steinmo, Thelen, and Longstreth 1992).

In the rest of this paper, we examine the development of the European polity, focusing on the construction and operation of the legal system.

CONSTRUCTING THE SUPRANATIONAL POLITY

The emergence of a transnational rule-of-law governmental system cannot be presumed. Our theory sug-

gests that transnational exchange is a critical catalyst for such an event, generating a social demand for dispute resolution (transnational triadic dispute resolution), revealing important collective action problems that beg for normative solutions (transnational rules), and thereby pushing for modes of supranational governance. The theory further suggests that once the causal connections among exchange, triadic dispute resolution, and rules are forged, the legal system will operate according to a self-sustaining and expansionary dynamic. But the development of causal linkages among our three variables implies the existence of, respectively, some measure of individual property rights, some form of adjudication, and a lawgiver. For well-known reasons (e.g., Waltz 1979), these conditions have been notoriously difficult to achieve and sustain in the interstate system.

In Europe, the six states that signed the Treaty of Rome in 1958, establishing the European Economic Community, were able to overcome some of these difficulties but only partly. The treaty contained important restrictions on state sovereignty, such as the prohibition, within the territory constituted by the EC, of tariffs, quantitative restrictions, and national measures "having equivalent effect" on trade after December 31, 1969. It enabled the pooling of state sovereignty by establishing legislative institutions and a process for elaborating common European policies. And it established "supranational" institutions, including the European Commission and the European Court of Justice, to help the Council of Ministers (the EC institution that is controlled by national executives) legislate and resolve disputes about the meaning of EC law. Despite these and other important innovations, the member states founded an international organization, not a transnational rule-of-law polity. Some treaty provisions announced principles that, if implemented, would directly affect individuals (e.g., free movement of workers, equal pay for equal work between the sexes), but the treaty did not confer on individuals judicially enforceable rights.

Even within a European free trade zone we would expect the transaction costs facing transnational exchange to be higher than costs faced by those who contract within a single national jurisdiction, other things equal, to the extent that at the supranational level there exists no secure common legal framework comparable in its efficacy to that furnished by national legal systems. In the absence of such a framework, those who exchange cross-nationally would face a kaleidoscope of idiosyncratic national rules and practices that would act as hindrances. The establishment of an effective European system of dispute resolution as a means of overcoming national barriers to exchange is therefore a crucial first step.

In the next section, we briefly examine the European Court of Justice (ECJ) "constitutional" case law. These judgments recast the normative foundations of the EC, radically upgrading the capacity of the legal system to respond to the demands of transnational society. It bears emphasis that this case law constitutes a neces-

sary condition underlying all the causal models tested in this paper.

The Constitutionalization of the Treaty System

The constitutionalization of the treaty system refers to the process by which the EC treaties have evolved from a set of legal arrangements binding upon sovereign states into a vertically integrated legal regime conferring judicially enforceable rights and obligations on all legal persons and entities, public and private, within EC territory. The phrase thus captures the transformation of an intergovernmental organization governed by international law into a multi-tiered system of governance founded on higher law constitutionalism. Today, legal scholars and judges conceptualize the EC as a constitutional polity, and this is the orthodox position (Lenaerts 1990; Mancini 1991; Shapiro 1992; Weiler 1981, 1991); international relations scholars are more reticent to do so for reasons internal to the development of international relations theory (Stone 1994a). In its decisions, the ECJ has implicitly treated its terms of reference as a constitutional text since the 1960s and today explicitly refers to the treaties as a "constitutional charter" or as "the constitution of the Community" (Fernandez Esteban 1994).

The ECJ, the "constitutional court" of the EC (Shapiro and Stone 1994, Weiler 1994), is the supreme interpreter of this constitution. The court's function is to enforce compliance with EC law. Although the outcome was not anticipated, the greater bulk of the court's case load is generated by preliminary references from national judges responding to claims made by private actors. The preliminary reference procedure is governed by Article 177 of the Rome Treaty. According to that article, when EC law is material to the resolution of a dispute being heard in a national court, the presiding judge may—and in some cases must—ask the ECJ for a correct interpretation of that law. This interpretation, called a preliminary ruling, shall then be applied by the national judge when settling the case. Article 177 was designed to promote the consistent application of EC law throughout EC territory. The member states did not mean to provide a mechanism by which individual litigants could sue their own government, or to confer on national judges the power of judicial review of national legislation. Both of these outcomes, however, inhere in the ECJ's vision of the community as a constitutional polity.

The constitutionalization process has been driven almost entirely by the relationship among private litigants, national judges, and the ECJ interacting within the framework provided by Article 177 (see Burley and Mattli 1993). The process has proceeded in two phases. In the 1962–79 period, the court secured the core constitutional principles of supremacy and direct effect. The ECJ made these moves without the express authorization of treaty law and despite the declared opposition of member states (Stein 1981). The doctrine of supremacy, announced in *Costa* (ECJ 1964), lays down the rule that in any conflict between an EC legal rule

and a rule of national law, the former must be given primacy. Indeed, according to the court, every EC rule, from the moment of entry into force, "renders automatically inapplicable any conflicting provision of . . . national law" (*Simmenthal*, ECJ 1978). The doctrine of direct effect holds that provisions of EC law can confer on individuals legal rights that public authorities must respect and that may be protected by national courts. During this period, the ECJ found that certain treaty provisions (*Van Gend en Loos*, ECJ 1963) and a class of secondary legislation, called "directives" (*Van Duyn*, ECJ 1974a), were directly effective. The "regulation," the other major type of secondary legislation, is the only class of Euro-rule that was meant (according to the Treaty of Rome) to be directly applicable in national law.

These moves integrated national and supranational legal systems, establishing a decentralized enforcement mechanism for EC law. The mechanism relies on the initiative of private actors. The doctrine of direct effect empowers individuals and companies to sue national governments or other public authorities for not conforming to obligations contained in the treaties or regulations or for not properly transposing provisions of directives into national law. The doctrine of supremacy not only prohibits public authorities from relying on national law to justify their failure to comply with EC law but also requires national judges to resolve conflicts between national and EC law in favor of the latter.

In a second wave of constitutionalization, the ECJ supplied national courts with enhanced means of guaranteeing the effectiveness of EC law. In *Von Colson* (ECJ 1984), the doctrine of indirect effect was established, according to which national judges must interpret national law in conformity with EC law. In *Marleasing* (ECJ 1990a), the court clarified the meaning of indirect effect, ruling that when a directive either has not been transposed or has been transposed incorrectly into national law, national judges are obliged to interpret national law as if it were in conformity with European law. The doctrine thus empowers national judges to rewrite national legislation—in processes of "principled construction"—in order to render EC law applicable in the absence of implementing measures. Once national law has been so (re)constructed, EC law, in the guise of a de facto national rule, can be applied in legal disputes between private legal persons (i.e., nongovernmental entities). Finally, in *Francovich* (ECJ 1991a), the ECJ declared the doctrine of governmental liability. According to this rule, a national court can hold a member state liable for damages caused to individuals due to the state's failure to implement a directive properly. The national court may then require the state to compensate such individuals for their financial losses.

In this case law, the ECJ has imagined a particular type of relationship between the European and national courts: a working partnership in the construction of a constitutional rule-of-law European Community. In that partnership, national judges become agents of the community order—they become community judg-

es—whenever they resolve disputes governed by EC law. The ECJ obliges national judges to uphold the supremacy of EC law, even against conflicting subsequent national law; encourages them to make references concerning the proper interpretation of EC law to the ECJ; and empowers them (even without a referral) to interpret national rules so that these will conform to EC law and to refuse to apply national rules when they do not.

The effectiveness of the EC legal system thus depends critically on the willingness of national judges to refer disputes about EC law to the ECJ and to settle those disputes in conformity with the court's case law. Although national judges embraced the logic of supremacy with differing degrees of enthusiasm, by the end of the 1980s every national supreme court had formally accepted the doctrine (Stone Sweet 1997a). National judges, persuaded by compelling legal arguments in support of supremacy; empowered themselves by, among other things, appropriating the power of judicial review of national legislation (Burley and Mattli 1993; Weiler 1991, 1994). The ease with which they were able to accommodate supremacy contrasts with the slower and more conflictual consolidation of the U.S. federal system (Goldstein 1994).²

Figure 1 plots the annual rate of Article 177 references, beginning with the first reference in 1961. It also temporally locates the leading constitutional decisions discussed here. The growth in the number of references is steady and dramatic. Without the doctrines of supremacy and direct effect, the level of preliminary references doubtlessly would have remained stable and low. In proclaiming supremacy and direct effect, the ECJ broadcast the message that EC law could be used by individuals, businesses, and interest groups to obtain policy outcomes that might otherwise be impossible, or more costly, to obtain by way of national policy processes. It is evident from the graph that litigants and national judges heard this message and responded.

Finally, it cannot be stressed enough that the EC legal system was constructed without the explicit consent of the member states. They possessed the means to reverse constitutionalization, but only by revising the EC's constitution. Treaty revision requires the unanimous vote of all members, acting as a constituent assembly, followed by national ratification (according to diverse procedures, including referenda). Given this decision-making rule, it is not surprising that the member states have never overturned an ECJ interpretation of the treaties.

Data Analysis

Our theory yields a set of testable propositions. First, transnational exchange generates social demands for transnational triadic dispute resolution. Specifically, higher levels of cross-national activity will produce

² In the nineteenth century, transformations in the common law, rather than in constitutional law, were fundamental to American economic development and therefore to American integration (Horwitz 1977).

FIGURE 1. Annual Number of Article 177 References to the European Court of Justice

Source: The source for Article 177 references is data collected by the authors and the ECJ.

Note: Landmark decisions are highlighted: A, Doctrine of Direct Effect of Treaty Provisions (1963); B, Doctrine of Supremacy (1964); C, Doctrine of Direct Effect of Directives (1974); D, Simmenthal Doctrine (1978); E, Doctrine of Indirect Effect (1984); F, Marleasing Doctrine (1990); and G, Doctrine of State Liability (1991).

more conflicts between national and EC law and therefore more Article 177 references. Second, higher levels of transnational activity will push for supranational rules (judicial or legislative) to replace national rules. Third, to the extent that European judicial and legislative institutions function with minimal effectiveness, European integration—as evidenced by the rising tide of the ECJ's case law and of EC legislation—will feed back into society. The consolidation and expansion of European governance will fuel more transnational activity and provide the normative context for more Article 177 references in an increasing number of domains. Fourth, to the extent that the above propositions hold, transnational activity, transnational judicial activity, and the production of European legislation will develop interdependently, and this interdependence will drive European integration in predictable ways. That is, once the causal linkages among these three factors have been constructed, a dynamic, self-reinforcing process will push for the progressive expansion of supranational governance. These propositions, of course, depend critically on the prior announcement by the ECJ of supremacy and direct effect.

We tested our theory with data collected in 1995 at the ECJ in Luxembourg. With the help of the court, we gathered information on Article 177 reference activity from 1961 to mid-1995 for a total of 2,978 references. We then coded each by country of origin, year of referral, the national court making the reference, and the subject matter of the dispute, among other things. These data had never been compiled. We also compiled data on transnational exchange and the production of European legal rules; for the former, we make heavy use of data on intra-EC trade, because it is the only reasonable indicator of transnational exchange for which we have reliable information reported annually, partner-by-partner, over the life of the EC.³

³ We are not arguing that intra-EC trade, one type of transnational

We have argued that transnational exchange is fundamental to the construction of a transnational legal system. To begin testing the proposition, we confronted one of the deepest mysteries of European legal integration: What accounts for the wide cross-national variance in the number of Article 177 references? The scholarly literature on the problem has produced a handful of reasonable candidate explanations, including the role of legal culture, the bureaucratic organization of the courts, the extent of constitutional monism or dualism, and the length of a judiciary's experience with judicial review. Two recent studies, one by Dehousse (1996) and the other a collaborative project focused on the reception of supremacy by the national courts (Slaughter, Stone, and Weiler 1997), assessed these and other factors in comparative perspective. Both studies generally conclude that variance in the intensity of the ECJ-national court relationship is overdetermined and/or explained by factors operating with different effects across national borders.⁴

Our theory provides an alternative explanation, one based on cross-national activity. Figure 2 depicts the correlation of the average level of intra-EC trade over 1961–92 on the average number of Article 177 references per year from the national courts of each of the twelve member states.⁵ We averaged the number of references annually in order to correct for the fact that some states joined the EC later than others, and we have combined reference data for Belgium and Luxembourg because the trade data for those states are combined by Eurostat reporting services. The linear relationship between intra-EC trade and references is nearly perfect ($\text{adj. } R^2 = .92$), with countries that trade more with their partners in the EC generating higher levels of Article 177 references. The results broadly support our theoretical claims. We also examined the effect on references of other plausible and quantifiable independent variables, including cross-national measurements of “diffuse popular support” for the EC legal system, population, and GDP, but none came

activity, subsumes other important forms of exchange, such as labor and capital flows, and the formation of EC interest groups and social movements. Unfortunately, data on these and other forms of exchange are incomplete and often unreliable. We would expect that increasing transnational activity of a particular type, within a given domain, will drive integration processes in that area (e.g., patterns in cross-national flows of workers will drive litigation in social security). Generally, we had good reason to expect that trade would dominate the construction of Europe since, for most of the life of the EC, the core of the European integration project has been the creation of a common market for goods and agriculture. For further discussion of this point, see tables 3 and 4.

⁴ There is little point in formally testing these explanations. We know by simply looking at the raw data on references comparatively that alleged relationships do not hold between the factors cited above and national levels of Article 177 references (e.g., the more monist the constitutional order, the more references generated). If these factors do affect levels of Article 177 references, they must operate with different effects across the EC.

⁵ In 1995, the Eurostat reporting service furnished annual intra-EC trade figures for 1958–92. Because the service has not yet updated these figures, and because subsequent data are reported on different scales, we have not used data after 1992 in any of the regression models reported here.

FIGURE 2. Intra-EC Trade and Average Number of Article 177 References

close to performing as well as intra-EC trade. See Appendix B.

Figure 2 depicts the relationship between intra-EC trade and Article 177 references cross-nationally, with no time element. Figure 3 depicts the relationship between the same two variables over time, since 1961, with no cross-national element. In this model, we include a dummy variable to account for (1) the constitutionalization of the treaties and (2) the prohibition of national restrictions on intra-EC trade (Article 30, EEC) that took effect on January 1, 1970. As we have seen, the doctrines of supremacy and direct effect made it possible for individuals to have their rights under EC law protected before their own national courts; and, as of 1970, Article 30—which proclaims the free movement of goods—provided the legal basis for traders to claim those rights (Poiarés Maduro 1997).⁶ We coded the dummy variable 0 from 1961-69 and 1 from 1970-92 (hereafter the “post-1969 dummy”).

Figure 3 plots the actual and predicted annual levels of Article 177 references for the EC as a whole. The predicted level—generated by a regression analysis in which the dependent variable is the yearly number of

Article 177 references and the independent variables are annual intra-EC trade and the post-1969 dummy—plots the references predicted by the independent variables. The adjusted $R^2 = .91$, and the coefficients for both intra-EC trade and the dummy variable are positive and statistically significant.

Our time-series data for intra-EC trade and Article 177 references are nonstationary (the augmented Dickey-Fuller test), a common problem for data containing a strong trend. We argue that our results are nevertheless valid for two reasons. First, the data on intra-EC trade and Article 177 references are cointegrated, indicating that a linear combination of the two variables is stationary.⁷ Second, we checked for serial autocorrelation in the error terms and found none.⁸

We would be more confident in our results if we had more observations. By using our time series and our cross-national data together, we were able to increase the number of observations and provide a more stringent test of the effect of transnational exchange on judicial activity. Table 1 presents the results of two pooled models. The first examines the effect of in-

⁶ In addition (pursuant to Article 33, EEC), in 1970 the European Commission produced a directive clarifying the meaning of the principle of free movement of goods and the lawful exceptions to it.

⁷ Using the Johansen cointegration test, we reject the hypothesis of no cointegration between these two variables at the .01 level.

⁸ Using Econometric Views 2.0, we examined the correlogram. All the autocorrelations of the residuals, with the exception of one (at $t = 8$), were within plus or minus two standard errors of zero.

FIGURE 3. Actual and Predicted Annual Levels of Article 177 References from Intra-EC Trade

Source: Trade data are from Eurostat (1995). The source for Article 177 references is data collected by the authors and the ECJ.

Note: The actual line plots the yearly number of Article 177 references by national courts to the ECJ, 1961–92. The predicted line plots the number of annual references predicted by the regression analysis in which intra-EC trade and a post-1969 dummy variable (coded 0 from 1961–69 and 1 from 1970–92) are the independent variables, and the dependent variable is the annual number of Article 177 references for the EC as a whole. Levels of aggregate trade begin with the original six member states (Belgium, France, Germany, Italy, Luxembourg, and the Netherlands); as new member states join the EC, their trade figures are included. The regression equation is $y = 3.56 + .0000938(\text{intra-EC Trade}) + 39.93(\text{post-1969 dummy}) + e$. The adjusted $R^2 = .91$, $n = 32$, $SEE = 17.92$, and the Durbin-Watson statistic for the regression equation = 1.85. The t -statistics are 0.59 for the constant, 10.59 for intra-EC trade, and 4.52 for the post-1969 dummy.

Source: The source for the trade data is Eurostat (1995). The source for Article 177 references is data collected by the authors and the ECJ.

Note: Entries are unstandardized regression coefficients, with t -statistics reported in parentheses. The dependent variable is annual Article 177 references for each member state, per year. The independent variable for model 1 is intra-EC trade, the value of both imports and exports for each member state (Belgium and Luxembourg combined) with all other member states, for each year. The independent variables for model 2 are intra-EC trade and a dummy variable coded 0 from 1961–69 and 1 from 1970–92. The model consists of 246 observations: Belgium-Luxembourg 1961–92; Denmark 1973–92; France 1961–92; Germany 1961–92; Greece 1981–92; Ireland 1973–92; Italy 1961–92; Netherlands 1961–92; Portugal 1986–92; Spain 1986–92; and United Kingdom 1973–92. Econometric Views 2.0 was used to estimate a fixed effects model. See Stimson (1985) and Sayrs (1989) for a discussion of pooled models.

*** $p < .001$.

tra-EC trade on Article 177 references, cross-nationally and over time; the second examines this same relationship but with the post-1969 dummy included as a second independent variable. The trade variable in both models is positive and highly statistically significant. Following the advice of Stimson (1985) and King (1986), after estimating the models, we ensured that no serial autocorrelation of the errors existed.⁹

Thus, we find strong support for our claim that transnational exchange has been a crucial factor driving the construction of the EC's legal system.¹⁰ Furthermore, our analysis does not conflict with—indeed, it builds on—the basic narrative told by legal scholars of how the ECJ constitutionalized the treaties.

⁹ Using Econometric Views 2.0, we examined the correlograms for each panel. All the autocorrelations of the residuals were within plus or minus two standard errors of zero, and no significant patterns were found.

¹⁰ We expect that as the European polity matures, the litigation of EC legal disputes will increase. We do not expect that Article 177 references will continue to rise indefinitely. The capacity of the ECJ to process references is limited. We predict that national judges themselves will increasingly resolve EC legal disputes on their own, without a prior reference. For a discussion of the problem of Article 177 and the overloaded docket of the ECJ, see Weiler 1987.

FIGURE 4. Actual and Predicted Annual Levels of Article 177 References from Intra-EC Trade and Euro-rules

Source: Trade data are from Eurostat (1995). Euro-rules are the annual number of directives and regulations promulgated by the EC. The source for Article 177 references is data collected by the authors and the ECJ.

Note: The actual line plots the yearly number of Article 177 references by national courts to the ECJ, 1961–92. The predicted line plots the number of annual references predicted by the regression analysis in which intra-EC trade, Euro-rules, and a post-1969 dummy variable (coded 0 from 1961–69 and 1 from 1970–92) are the independent variables, and the annual number of Article 177 references for the EC as a whole is the dependent variable. Levels of aggregate trade begin with the original six member states (Belgium, France, Germany, Italy, Luxembourg, and the Netherlands); as new member states join the EC, their trade figures are included. The regression equation is $y = 2.84 + .0000731(\text{Intra-EC Trade}) + 2.04(\text{Euro-rules}) + 31.35(\text{post-1969 dummy}) + e$. The adjusted $R^2 = .92$, $n = 32$, $SEE = 17.01$, and the Durbin-Watson for the regression equation = 2.18. The t -statistics are .50 for the constant, 5.55 for intra-EC Trade, 2.04 for Euro-rules, and 3.34 for the post-1969 dummy.

We have also argued that the emergence of effective transnational triadic dispute resolution is seminal to the emergence of supranational governance. Our theory suggests that the operation of the legal system will produce powerful feedback effects, the most important of which are normative (rule based). One crucial function of triadic dispute resolution is to produce stable, normative solutions to collective action problems. In principle, a governmental system can be constituted entirely by judicial rule making: The dispute resolver governs by the pedagogical authority of its decisions. In practice, courts share governmental authority with legislative bodies, not least because legislating is a more efficient way to produce legal rules than is adjudicating. Once a transnational legal system has been consolidated, the production of European legal rules—whether by judicial or legislative processes—will facilitate the expansion of transnational exchange.

To evaluate the interrelationships that may have developed among our three variables, we collected data on the annual production of the two general categories of EC legislation: regulations and directives (hereafter called Euro-rules). Both types of legislation

are drafted and proposed by the European Commission, a supranational body that blends legislative and administrative functions (Ludlow 1991). Simplifying a complicated process, these proposals can be amended in interactions involving the European Parliament, the commission, and the Council of Ministers (Tsebelis 1994). Euro-rules are finally adopted by the council, a body composed of ministers from member governments, the exact composition of which is determined by the subject matter of EC law under discussion (Wessels 1991).

Figure 4 plots the actual and predicted annual levels of Article 177 references for the EC as a whole. The predicted line (generated by a regression analysis in which the dependent variable is the yearly number of Article 177 references and the independent variables are annual intra-EC trade, the annual number of Euro-rules promulgated, and the post-1969 dummy) plots the level of references predicted by the independent variables. The adjusted $R^2 = .92$, and the coefficients for all three variables are positive and significant, as expected.¹¹

¹¹ Using the Johansen cointegration test, we rejected the hypothesis

FIGURE 5. Annual Levels of Intra-EC Trade, Euro-rules, and Article 177 References

Note: The Article 177 references are the yearly number for the EC as a whole, 1961–92. The Euro-rules are the annual number of directives and regulations promulgated by the EC. The intra-EC trade line plots levels of aggregate intra-EC trade for the EC as a whole. The graph has been rescaled since the variables are on different scales.

Figure 5 depicts the growth of transnational exchange (in the form of intra-EC trade), the evolution of transnational judicial activity (in the form of Article 177 references), and the development of transnational legal norms (in the form of Euro-rules). It thus shows the development of the European polity. The high intercorrelation among the three variables is another way of describing the virtuous circle at the core of our theory.

Do European integration processes serve to expand transnational activity? To answer that question, we compared annual rates of growth in trade over the life of the EC among (1) EC states with one another and (2) non-EC states with EC members. In order to maximize comparability, we focused on two groupings: the original six members and the three states (Den-

mark, Ireland, and the United Kingdom) that joined in 1973. As the numbers in Table 2 show, before 1973, the growth in trade was far higher among EC members than between EC states and the three nonmembers. Once these latter joined the EC, their growth rates rose above levels achieved by the original six. Although trade is a crucial measure of the degree of integration among EC members, its relative importance in activat-

TABLE 2. Average Growth Rates in Trade between Individual States and All EC Members, by Period, in Percentage

	1961–72	1973–92	Percentage Change

Average	8.0	10.9	+38.4

Source: Eurostat (1995).

Note: Entries under the 1961–72 and 1973–92 columns are the average rate of growth in trade between each member state listed with all members of the EC. Entries under the third column are the change registered, between the two periods, in the growth rates in trade between each state listed with all members of the EC. Belux combines Belgium and Luxembourg. Denmark, Ireland, and the United Kingdom entered the EC in January 1973.

of no cointegration among these three variables at less than the .05 level. To test further the existence of a cointegrating relation, we undertook two separate tests (see Johnston and DiNardo 1997, 266–70). First, using the augmented Dickey-Fuller test, we checked to ensure that the residuals from the regression analysis were stationary. We were able to reject the hypothesis of nonstationarity at the .01 level. Second, we fitted a general autoregressive distributive lag (ADL) specification to these variables. This entails using lagged values of the three variables on the right-hand side of the OLS equation. We then conducted *F*-tests on the sums of the coefficients for current and lagged values for each variable (results omitted). Results show that the sums of the coefficients for both the Article 177 references and intra-EC trade variables differ significantly from zero at the .01 level. The *p*-value for the sum of the coefficients for the Euro-rules variable was .076, which approaches statistical significance. Taken together, these tests provide further support for our claim that these three variables have come to develop interdependently.

TABLE 3. Distribution of Legal Claims by Subject Matter, Article 177 References

<i>Subject Matter</i>		1961-70	1971-75	1976-80	1981-85	1986-90	1991-95

Percentage of total claims by period		3.8	9.1	18.2	19.6	21.2	28.1

Source: Data compiled by the authors with the help of ECJ.

Note: The table lists only the thirteen most important legal domains, which together comprise more than 80% of the 3,855 total claims. We coded references by subject matter and relevant provision of the EEC Treaty. Each of the legal subject matters listed in the first column corresponds to the articles of the EEC Treaty following in parentheses: agriculture (38-47); free movement of goods (9-37); social security (51); taxes (95-9); competition (85-94); approximation of laws (100-2); transportation (74-84); establishment (52-66); social provisions (117-22); external free movement of workers (48-50); environment (130R-T); and commercial policy and dumping (110-6). Although most references are limited to a single subject matter of EC law, some references contain claims based on as many as five subject matters. This accounts for the difference between the total number of references and the total number of subject matters invoked in references.

^aThe freedom to establish undertakings and to provide services.

^bA miscellaneous category including all EC economic policies affecting the European Free Trade Area, the GATT, food aid, and special agreements with non-EC states.

ing the legal system also must be evaluated in terms of changes in the density and scope of Euro-rules.

The theory, after all, posits an expansive logic to integration processes. According to this logic, the growing interdependence of transnational exchange, judicial activity, and Euro-rules drives the progressive construction of the supranational polity. By that we mean the process by which governmental competences, in an increasing number of domains, are transferred from the national to the supranational level. Simply put, as triadic dispute resolution and other processes remove the most obvious hindrances to transnational exchange (border inspections, fees and duties, and so on), and as supranational coordinative rules replace the disparate rules in place in the member states, new obstacles to integration are revealed and become salient (such as regulations protecting consumers and the environment). These national rules and practices will be targeted by litigants, and pressure will be exerted on EC legislative institutions to widen the jurisdiction of EC governance into new domains. We think of this dynamic as a kind of legal "spillover."

Our data provide some preliminary support for our

contention. First, we examined the evolution of the substantive content of Article 177 references. Recall that these claims constitute allegations, by private litigants, that rules or practices in place in an individual country conflict with Euro-rules. Litigants have therefore requested national judges to enforce EC law by, in effect, eliminating conflicting national rules or practices. Table 3 charts this evolution, vividly recording the extent to which the domain of EC law has expanded. The percentage of claims involving the direct exchange of goods—the free movement of goods and agriculture—has steadily declined, dropping from more than 50% in 1971-75 to 27% in 1991-95. At the same time, more indirect hindrances to trade, such as national rules governing equal pay for equal work (social provisions), environmental protection, and taxation policy, have become important sites of contestation.

Second, we assessed the relationship between trade and Article 177 references over time by including a variable to capture the interaction of intra-EC trade and time. Table 4 presents the results of this model. Our expectation about the interaction variable was that

TABLE 4. The Declining Effect of Intra-EC Trade on Article 177 References: Pooled, Cross-sectional, Time-series Models

Intra-EC trade	.000283*** (5.26)

Source: The source for the trade data is Eurostat (1995). The source for Article 177 references is data collected by the authors and the ECJ. Note: Entries are unstandardized regression coefficients, with *t*-statistics reported in parentheses. The dependent variable is annual Article 177 references for each member state, per year. The independent variables are intra-EC trade, or the value of both imports and exports for each member state (Belgium and Luxembourg combined) with all other member states, for each year; a dummy variable coded 0 from 1961–69 and 1 from 1970–92; and an interaction variable, which is intra-EC trade multiplied by year. The model consists of 246 observations: Belgium-Luxembourg 1961–92; Denmark 1973–92; France 1961–92; Germany 1961–92; Greece 1981–92; Ireland 1973–92; Italy 1961–92; Netherlands 1961–92; Portugal 1986–92; Spain 1986–92; and United Kingdom 1973–92. Econometric Views 2.0 was used to estimate a fixed effects model. See Stimson (1985) and Sayrs (1989) for a discussion of pooled models.

** $p < .01$; *** $p < .001$.

the coefficient would be negative, indicating a declining effect of trade on Article 177 references over time. The coefficient for the interaction variable is indeed negative and statistically significant. We believe that the growing articulation and differentiation of the Euro-rules that constitute the EC's normative structure will gradually generate more Article 177 references.

In the next section, we examine more closely our contention that the operation of the EC legal system both provokes and reinforces the spillover effects that partly drive the construction of supranational governance.

DISPUTE RESOLUTION AND THE DYNAMICS OF SUPRANATIONAL GOVERNANCE

We have argued that integration processes are *generally* driven by transnational activity, by efforts of supranational institutions to reduce transaction costs, and by the positive feedback effects on transnational society of supranational judicial lawmaking and legislating. In this section, we cross-check our theory by, among other things, examining concrete policy outcomes in specific domains of EC law. We therefore shift the perspective from the broad relationships depicted in the statistical analysis to a more fine-grained examination of how, and to what effect, the legal system operates. Because our theory fundamentally conflicts with the dominant framework, intergovernmentalism, we begin by summarizing our differences.

Intergovernmentalists argue that national executives are in control of every crucial step in the construction of the European polity. Employing a logic derived from two-level game imagery (Evans, Jacobson, and Putnam

1993), Moravcsik (1993, 1994), for example, claims that governments, acting in the Council of Ministers and in summit meetings, establish the parameters that determine the content, scope, and pace of integration. Governments cooperate to achieve their policy goals and to enhance their autonomy in domestic politics. Due to the decision-making rules in place in most EC legislative processes (unanimity and super-majority voting), the Euro-rules produced reflect the preferences of those governments which support the least amount of integration in any given area (the lowest common denominator). The behavior of private actors, subnational public authorities, and the EC's organs are secondary; they serve to "consolidate" new levels of integration (Moravcsik 1995).

Intergovernmentalists also have sought to explain the operation of the legal system. Employing a logic derived from principal-agent theories of delegation (Kiewiet and McCubbins 1991), Garrett (1992) argues that the ECJ (the agent) serves the interests of the dominant members in the EC (the court's principals). The ECJ, intergovernmentalists claim, codifies the preferences of these states in its case law. It does so in order to avoid court-curbing measures and to secure compliance with its rulings.

In contrast, we argue that governments do not control legal integration in any determinative sense and therefore cannot control European integration more broadly. We do not want to be misunderstood. The EC polity contains strong "intergovernmental" components, that is, EC politics are partly constituted by the interactions among representatives of the governments. But it is our contention that "intergovernmentalism," when that term denotes the body of theory and causal propositions about European integration, is deeply flawed (see also Pierson 1996). In using the word *intergovernmentalism*, we need to distinguish the descriptive from the theoretical label. Moreover, any theory of European integration must notice and take account of the role of governments, clearly stating how that role is conceptualized.

The Council of Ministers and representatives of the member states are important actors in European politics. We understand their effect on integration to be positive when they (1) work with supranational institutions to adopt, at the supranational level, Euro-rules and (2) transpose, on the national level, European directives into national law. They have a negative influence on integration when they (1) block EC legislation (in their capacity as members of the council) and (2) refuse to comply with the Euro-rules they do not like (in their capacity as national governments).

Generally, we expect governments to be more reactive than proactive within integration processes. European integration facilitates not only transnational trade but also the construction of associations and social movements, and this exchange, as it rises, pressures governments to act in prointegrative ways. At any point in time, and in any particular area, governments can fail to respond to transnational interests, but (if levels of exchange are rising) only at ever-increasing costs. Thus, we expect that the pace of integration will vary

across issue areas, partly as a function of the relative intensity of transnational activity in a given area. And we expect the EC's legal system to serve the interests of transnational society, not individual governments, or even a consortium of powerful governments (the argument is elaborated more fully in Stone Sweet and Sandholtz 1997).

Empirically, our differences with intergovernmentalists must begin with the challenge of explaining the constitutionalization of the treaty system. As we have tried to demonstrate, constitutionalization profoundly transformed the EC polity. As discussed above, the ECJ, activated by Article 177 references, constructed the EC legal system: It worked to diffuse the doctrines of supremacy and direct effect and to provide national judges with the means to enforce EC law, even against national governments and the legislatures that governments control. Further, constitutionalization did not take place surreptitiously. During the proceedings that preceded the ECJ's announcements of supremacy and direct effect, various governments argued, in formal "observations"—briefs advising the court how it should decide—that the Treaty of Rome could not be interpreted so as to support either doctrine (Burley and Mattli 1993, Stein 1981). Nevertheless, the court revised the treaty by authoritatively interpreting it, and these interpretations transformed the nature of EC governance. Governments agreed to this transformation, but only after the fact and only tacitly, by progressively adjusting their behavior to the emergence of new rules.

We view the ECJ, not unlike Weiler (1981, 1991, 1994) and Burley and Mattli (1993), as generally working to enhance the autonomy of the EC legal system, autonomy that is then exercised to promote the interests of transnational society and to facilitate the construction of supranational governance. The court does not work in the interests of member governments, except in the very loose sense in which those interests can be construed as being in conformity with the treaty's purposes broadly—not narrowly—conceived. The move to supremacy and direct effect must be understood as audacious acts of agency. The ECJ could afford to move aggressively to revise the treaty on its own, because its formal relationship with the member states is a permissive one. Given the decision-making rule in place (unanimity), the credibility of the threat that the member states would reverse constitutionalization—or any ECJ treaty interpretation—was and remains low.

We now examine the dynamics of integration in two very different areas: the free movement of goods and the Europeanization of social provisions. While we cannot claim a representative sample, the cases selected vary along a number of dimensions, several of which deserve emphasis. The free movement of goods domain constitutes *negative integration*, the removal of national rules that hinder transnational exchange. This domain is a core value of the EC polity and is the most highly developed of European law. The production of EC social provisions constitutes *positive integration*, the elaboration of supranational rules that replace (or fix

standards for) national rules governing in a particular area. Such rules regulate exchange among individuals and between individuals and their government. Unlike negative integration processes, wherein the dominance of the ECJ and its case law is virtually total, the competence to make rules in the social area is shared by the court and the EC's legislative institutions (including the Council of Ministers, which generally has the last word). Since the late 1970s, the EC has produced five major directives on equal treatment and nondiscrimination between the sexes in the workplace and in benefits. In negative integration processes the potential for large collective gains from trade is obvious; in positive integration processes, the efficiency logic of integration is greatly reduced. Given these and other important differences, to the extent that the EC legal system operates in invariant or similar ways, our claims are better supported or undermined.

We begin with Article 177 references. Recall that most are triggered by litigants who claim that rules or practices in place in a member state are not in compliance with EC law and request, nevertheless, that a national judge enforce EC law. Activated by these references, the ECJ was able to construct the EC legal system by taking decisions that voided the application of national rules and practices in favor of Euro-rules. Thus, most rulings are rendered in the bright light of clearly revealed preferences on the part of a member state *not* to comply. This dynamic belies, on its face, intergovernmentalist assertions. And, as mentioned above, governments participate directly in Article 177 processes by regularly filing with the court legal briefs defending the legality of their own (or any other national) rule or practice, and by indicating to the court how they believe the dispute ought to be decided. Thus, in advance of any important decision, the ECJ is normally well informed of governmental preferences.

Congruent with our theory, we expect Article 177 litigation to be patterned in predictable ways. In stating these expectations as testable propositions, we further clarify our differences with intergovernmentalists. First, other things being equal, references will target disproportionately those national barriers to transnational activity that hinder access to larger markets relative to smaller markets. The hypothesis can be tested by examining the effect of litigation on negative integration, that is, the removal of barriers to trade and other activity. Second, other things being equal, references will target disproportionately those national rules and practices that operate to downgrade the effect and application of European secondary rules. The legal system will then operate to push the lowest common denominator upward, in a progressive and prointegrative direction, nullifying the lawmaking effects of unanimity voting in the council. The hypothesis can be tested by examining the effect of litigation on positive integration via the production of harmonized European rules and their transposition into national legal regimes. Our general claim is, therefore, that the EC legal system works to dismantle barriers to transnational activity in place in the dominant member states and to ratchet Euro-rules upward from the lowest

TABLE 5. Article 177 References Regarding Free Movement of Goods and Social Provisions: Percentage Difference, Actual Number, and Proportional Share

Member State	Free Movement of Goods			Social Provisions		
	Percentage Difference	Actual Number	Proportional Share	Percentage Difference	Actual Number	Proportional Share
Austria	-.05	0	.4	.55	1	.1
Belgium	-4.89	42	74.8	.22	19	18.36

Source: Excerpted from Appendix A.

Note: The first column indicates the positive or negative extent to which litigants are attacking the rules of a particular member state in a particular legal domain relative to other member states and other areas. The second column indicates the number of Article 177 references in that legal domain in each member state. The third column indicates the number of references each member state *would have registered* if there were no difference between overall litigation rates for each member state and rates of litigation for each member state in each policy area. For instance, France accounts for slightly less than 17.1% of all references. Thus, France's proportional share of free movement of goods references is 17.1% of the 670 total references in that category, or 114.3. In other words, the proportional share entries are from the table of no association (the basis for the chi-squared test). French courts actually made 116 references in this same legal domain. Therefore, the percentage difference for France is calculated as follows: $(116 - 114.3)/670$. Entries may differ slightly due to rounding.

common denominator. If we are right, another proposition follows logically: State preferences will not have a significant effect on judicial outcomes. These claims and predictions conflict, fundamentally, with intergovernmentalist expectations.

Table 5 depicts cross-national patterns of litigation in the legal domains of free movement of goods and social provisions (more complete material is contained in Table A-1). The "percentage difference" column provides us with a rough benchmark for evaluating these patterns. The "actual number" column indicates the total number of Article 177 references registered in each of the member states, per legal domain. The "proportional share" column indicates the number of references each state would have generated if there were no difference between overall litigation rates and rates of litigation in specific legal areas. Thus, if a state accounted for 12% of total references, we assigned a proportional share of 12% of the references in each domain to that state (in other words, they are entries from the table of no association, the basis of the chi-squared test). We then subtracted, for each category and for each state, the predicted number of references from the actual number of references and standardized the difference by percentage. Thus, the percentage differences have positive and negative signs. A high positive value indicates that litigants are attacking the rules of a particular country in a particular legal domain relative to other countries and other areas. A negative value indicates that a country is not being dragged to the ECJ as often as we might expect based on overall litigation rates relative to other member states and policy areas.

Note that in the free movement of goods domain,

accusations of German noncompliance dominate EC litigation. Of 670 references concerning that domain, 265 (40%) target German laws. This does not mean that Germany has been more protectionist than every other EC member. It does mean that the German market, the largest in the EC, is the prize of free traders. Furthermore, it means that the matrix of trade-relevant rules in place in Germany has provided the predominant context for the ECJ's construction of an integrative case law.

Confidence in our theory is further strengthened by empirical studies of outcomes. Kilroy (1996), in her analysis of free trade cases, assessed the relationship between observations—the briefs filed by the European Commission and governments in pending cases—and the ECJ's rulings. She found that in 81 decisions (two-thirds of her pool), the court struck down national rules as treaty violations; in 41 cases (one-third of her pool), the court upheld national rules as permissible under EC law. She further found that in 98 of 114 cases in which the commission intervened, the court sided with the commission. The commission's position therefore predicted the ECJ's decision 86% of the time. The position of governments utterly failed to predict the court's rulings; German interventions were found to be particularly ineffectual in generating outcomes. Following the logic of Garrett (1992), Kilroy (1996, 23) finds it "surprising that Germany has a relatively lower impact on the Court." But we do not. The EC's supranational institutions—especially the commission and the court—operate to facilitate transnational activity, not to codify or give legal comfort to the preferences of the dominant states.

These numbers tell only part of the story. As impor-

tant has been the positive feedback effect of ECJ decisions on integration processes. The free trade case law, initiated in 1974 with *Dassonville* (ECJ 1974b), sustained the integration project at a time when the legislative process was stalled by disputes among governments and between the Council of Ministers and the commission (Gormley 1985, Oliver 1988). Out of this case law came the famous principle of mutual recognition of national standards, which the ECJ used to help construct the common market. In developing this principle, the court demonstrated how member states might retain their own national rules, capable of being applied to the production and sale of domestic goods within the domestic market, while prohibiting members from applying these same rules to goods originating elsewhere in the community. The ECJ's case law also placed national regulations in "the shadow of the law," raising the specter of relentless litigation against rules that do not comply with the dictates of mutual recognition.

Simplifying a complex chain of events, the adjudication of disputes over free movement of goods between traders and member states triggered a political process by which the commission, in alliance with transnational business coalitions, converted mutual recognition into a general strategy that could be extended beyond free movement. That strategy ultimately resulted in the 1986 Single European Act. The literature on the act has sufficiently demonstrated that governments did not meaningfully control this process (Alter and Meunier-Aitshalia 1994, Dehousse 1994, Sandholtz and Zysman 1989). Instead, governments were forced to adapt to it. Governments did act, of course, in negotiating a treaty that codified prointegration solutions to collective action problems (Moravcsik 1991), including the principle of mutual recognition. But most of these solutions had already emerged out of the structured interactions among transnational actors, the ECJ, and the commission.

We turn now to social provisions, the cluster of treaty rules and directives governing nondiscrimination on the basis of sex in pay and employment benefits. Table 5 shows that litigation originating in the British judiciary has driven the ECJ's docket in this area. Fully 24% (40/167) of all references in this domain have attacked, as inconsistent with EC law, legal rules and administrative practices in the United Kingdom. It is well known that the British government has constituted the crucial veto point in legislative deliberations within the Council of Ministers on social provisions (Pillinger 1992, 85–101). Indeed, since the first directive was adopted by the Council of Ministers in 1975, the British government has not wavered in its intention, publicly declared, to veto any European proposal that would enshrine in EC law any rules not already enacted by Parliament (Kenney 1992). The data show that, in this sector, litigation has disproportionately attacked the national rules and practices that represented the lowest common denominator position on EC secondary legislation adopted by the council.

We then tested our predictions concerning outcomes and the effect of observations made by the commission

and the governments in all Article 177 references to the ECJ in the social provisions area, from 1970 (the date of the first reference in this domain) through 1992. Rulings were coded into one of two categories: either the court accepted a national rule or practice as consistent with EC law or declared it to be in violation. Of the 91 judgments that could be unambiguously coded,¹² the ECJ declared violation of EC law in 48, a success rate of 53% for plaintiffs in national courts. The ECJ considered the lawfulness of British practices in 24 rulings, declaring violations in 13. Aggregating results from litigation involving the big three—France, Germany, and the United Kingdom—the court ruled violations in 24 of 41 decisions (59%). We also found, as Kilroy had in the free movement area, that the commission's briefs tracked results far better than did the observations filed by governments. The commission's success rate is a whopping 88%: 73 of its 83 observations predict the direction of the final ruling. The United Kingdom's rate of success was 58% (31 of 54 observations tracked final results). This challenges the intergovernmentalist assertion that the preferences of the most powerful states systematically constrain the ECJ.

The effect of the ECJ's case law on national and supranational policy processes and outcomes in the social domain has been deep and pervasive. A large body of scholarship (e.g., Ellis 1991; Harvey 1990; Kenney 1994, 1996; Pierson 1996; Pillinger 1992; Prechal and Burrows 1990) has documented the extraordinary extent to which the ECJ has used its powers for creative interpretation of EC secondary legislation, like directives, and to ratchet up the lowest common denominator position in the Council of Ministers. Kenney (1992, chapter 3), who has examined the relationship between EC and British sex discrimination law in great detail, shows that by the mid-1980s "the EC [had] eclipsed the British parliament as the arena of innovation" in this respect. Tory governments have been forced by national court decisions to ask Parliament, on successive occasions over the past fifteen years, to amend British statutes to conform to the ECJ's evolving case law.¹³ In this area, at least, lowest common denominator bargains struck in the council of Ministers have not stuck. Instead, the court has more or less systematically ratcheted obligations upward, in a prointegration direction.

Finally, we examined the relationship between this case law and the work of the Council of Ministers. We found that the ECJ has used Article 177 references to

¹² We were forced to exclude data from ECJ judgments rendered in 1993 (14 cases); as of June 1997, the European Court Reports for that year were unavailable, having been recalled to correct for errors.

¹³ Relative to other European judiciaries, one would expect the British courts to enforce EC law only with great difficulty. The doctrine of parliamentary sovereignty formally prohibits judicial review of legislation, on any grounds, and doctrines governing the resolution of conflicts between treaty law and parliamentary statutes conflict with the ECJ's doctrine of supremacy. Both of these long-lived orthodoxies have been swept aside, in areas governed by EC law, as the British judiciary has incorporated as national law the doctrines of supremacy, direct effect, and indirect effect (Craig 1991, Levitsky 1994).

legislate, by judicial fiat, provisions vetoed in the council. In a wave of cases decided in 1990 and 1991, the ECJ boldly usurped the council's legislative primacy by enacting (as a matter of treaty interpretation) the substance of provisions contained in three different legislative proposals.¹⁴ Each of these proposals had been drafted by the commission, either to extend nondiscrimination provisions to new areas or to enhance the enforceability of Euro-rules on equal treatment in the national courts. And each had been vetoed by the United Kingdom, among other governments, in the council.

Thus, outcomes in both of the legal domains examined are broadly consistent with predictions derived from our theory, but they are inconsistent with intergovernmentalist expectations. Although our analysis does not constitute a definitive test, we are confident that our theory outperforms intergovernmentalist theories more generally.¹⁵ Again, we have not argued that member state governments are irrelevant. It is our contention, however, that they do not meaningfully control integration processes. Existing intergovernmentalist theories of integration may well help us understand the bargaining processes in the Council of Ministers and in European summits. But this bargaining takes place within contexts constructed by processes explained by our theory.

In summary, we believe that the EC legal system operates according to a generalizeable dynamic. Individuals ask national judges to void national rules or practices in favor of EC legal rules within a particular domain of activity. Transnational dispute resolution—the interaction among litigants, national courts, and the ECJ—recasts the law governing that domain of activity and, therefore, the policymaking environment. As new rules are generated and existing rules are reinterpreted, national governments (in whose territory rules or practices are now out of step with EC rules) are placed in an ever longer and darker “shadow of the law.” The court's case law provides the commission with the constitutional backing for its own policymaking goals, to the extent that these goals are them-

selves integrative. And this case law enhances the capacity of individuals to initiate future litigation, by providing potential litigants with more precise information about the content and scope of European law. Thus, in process tracing, we see again the self-sustaining dynamic that we theorized and then found in the quantitative analysis.

CONCLUSION

We have proposed a theory of how a transnational rule-of-law polity may emerge. This emergence, the theory implies, depends critically on the construction of causal linkages among three factors: exchange, triadic dispute resolution, and the production of legal rules. We derived a set of propositions from the theory and tested them in the case of the European Community. We then cross-checked our quantitative results by process-tracing in two discrete areas of EC law. We found broad support for the general theory and for specific claims about how the EC legal system operates.

We emphasized the transformative effect of the ECJ's early case law, which “constitutionalized” the treaty system. Relative to the EC as originally conceived by the member states (and relative to pure intergovernmental fora), constitutionalization made the EC far more responsive to the demands of transnational society—those who exchange across borders. In the EC, individuals can activate transnational adjudication processes on their own. In virtually all other international regimes, individuals must rely on intermediaries, usually representatives of governments, to press their claims and to pursue their other interests. But in the EC, the operation of the legal system has progressively reduced the capacity of national governments to control policy outcomes, while it has enhanced the policy influence of the EC's supranational institutions, national judges, and private actors.

We end by suggesting that our theory may help us understand the evolution of rule-of-law systems more generally. North (1990) has shown us that individual behavior, governmental organizations, and rules often evolve symbiotically, determining a great deal of what is most important about modern economic and political systems. North (1990, 35) has further argued that “impersonal exchange with third party enforcement . . . has been the critical underpinning” of successful modernization and political development. Shapiro (1980) has demonstrated that courts are crucial to regime formation, state-building, and the consolidation of political legitimacy. Judges, because they are agents of normative (rule-oriented) change in rule-of-law societies, possess the broad capacity to configure and reconfigure the polity. Certainly, they have done so in North America (e.g., Horwitz 1977; Russell, Knopff, and Morton 1989; Wolfe 1986), in Europe (e.g., Burley and Mattli 1993; Kommers 1989; Shapiro and Stone 1994; Stone 1992, 1994b; Weiler 1991), and in some international regimes (e.g., Hudec 1993, Stone Sweet 1997b). As we are now experiencing a “global expansion of judicial power” (Tate and Vallinder 1995), we have

¹⁴ The court enacted: (1) in *Barber* (ECJ 1990b), abrogations of those provisions of the Equal Treatment (1976) and Social Security (1979) directives that had permitted member states to derogate from principles of equal treatment in retirement pensions; (2) in *Dekker* (ECJ 1991b), the main provisions of the “pregnancy directive,” which were designed to protect pregnant women from discrimination; and (3) in *Hertz* (ECJ 1991c), the core elements of the proposed “burden of proof” directive, which was designed to shift the burden to the member states in cases involving sex discrimination.

¹⁵ Intergovernmentalists tend to conceptualize the activities of the ECJ in terms given by game theory or principal-agent theory. In this imagery, the Eurolaw “game” is dyadic, played by member states (or principals) in one seat and the ECJ (the agent) in another (e.g., Garrett 1992, Kilroy 1996). Such analyses all but ignore two sets of actors—private litigants and national judges—who are crucial to how the legal system functions. Moravcsik (1993, 513) openly admits that his intergovernmentalism cannot explain the construction of the legal system (but see also Moravcsik 1995). It is our contention that the operation of the legal system—highly structured interactions among private litigants, national judges, and the ECJ—is at the very core of European integration processes writ large. Political scientists cannot begin to explain the dynamics of European integration without a coherent account of legal integration.

Actual number	34	41	4	2	33	40	3	10	16
Proportional share	42.9	48.8	14.3	4.0	24.9	10.7	2.8	10.5	8.8

Note: A = free movement of goods; B = agriculture; C = competition and dumping; D = external policy; E = social security; F = social provisions; G = environment; H = establishment; I = free movement of workers; J = taxes; K = transportation; L = common policy; M = approximation of laws; N = other. Actual number indicates the number of Article 177 references in that legal domain for each member state. Proportional share entries are the number of cases that each member state would have registered in each legal domain if there were no difference between overall litigation rates for each member state and rates of litigation for each member state in each policy area. Thus, if Germany accounts for 30% of the references overall, we assigned a proportional share of 30% of the references in each policy area to Germany. In other words proportional share is the "table of no association" (the basis of the chi-squared test). Bold entries are percentage differences, which are calculated the following way: (Actual number - Proportional share)/total number of references in the legal domain. These entries are indicative of the positive or negative extent to which litigants are attacking the rules of a particular member state in a particular domain relative to other member states and other areas.

every reason to theorize more rigorously the political effect of triadic dispute resolution.

APPENDIX B

We tested whether higher levels of references per member state are generated, respectively, by (1) higher levels of diffuse support for the European legal system (measures developed by Caldeira and Gibson 1995), (2) larger populations (aggregated as the average population for each member state, 1961–93), and (3) larger economies (aggregated as the average GDP for each member state, 1961–93). The dependent variable for each model is the average number of Article 177 references per member state, and $n = 11$. Our results are summarized as follows:

	Inter- cept	<i>t</i>	coefficient	<i>t</i>	Adj. <i>R</i> ²	SEE
Diffuse						
support	10.08	3.92	19.88	1.18	.04	8.54
Population	6.40	1.55	9.43 (10 ⁻⁸)	1.16	.03	8.55
GDP	3.33	1.48	1.48 (10 ⁻¹¹)	4.30	.63	5.27

The index of diffuse support for the ECJ is from Caldeira and Gibson (1995, 364). Population data are from the World Tables of Economic and Social Indicators (World Bank 1990). GDP data for 1960–69 are from the Cross-National Time-Series Study Banks 1976; and GDP data for 1970–94 are from the World Tables (World Bank 1995).

Liberal Theory and the Idea of Communist Justice

ARTHUR DIQUATTRO *William O. Douglas Institute*

My aim is to bring Marx's general theory of exploitation into line with contemporary theories of distributive justice advanced by liberal egalitarians, theories that stress the ideal of equal concern and respect for persons qua persons and require implementation of the ideal consistent with what historical circumstances permit. I begin by dismissing the labor theory of value as relevant to Marx's general theory, emphasizing instead a "property rights matching power" account. I conclude with some speculative comments about Kantian influences in Marx's sense of justice. Throughout, I assume that Marx believes that exploitation is unjust, and I pursue and sharpen this view in my analysis of Marx's criticism of the distributive principle of socialism.

Jeder nach seinen Fähigkeiten, jedem nach seinen Bedürfnissen!" (Marx and Engels [1875] 1962, 21).¹ This is the distributive principle advocated by Marx and his followers for communist society. In this society, there is no market for production or consumption goods, the market having been phased out during the transition period separating capitalism from communism. During this transitional interval, people consent to the gradual substitution of their individual purchase in the marketplace for the collective provision of consumption goods. The substitution would be piecemeal, geared to providing an increasing number of public goods.² Beginning with basic necessities, prices would be lowered slowly while the government's exchange branch notes the reaction of demand to price changes. If demand is fairly inelastic and goods nonsubstitutable, then prices can be lowered to zero. The reduction of prices and their eventual disappearance would be paid for by lowering the money wages paid to individuals in exchange for their work, by substituting a social payment for an individual wage. For example, instead of a worker receiving \$100 daily, s/he might receive \$80, but that person's medical care, education, musical training, access to national parks, bread, fish, and salt would be "free" for the taking.

Already in advanced capitalist countries, especially those with strong labor movements (e.g., Sweden), there is a not insignificant public welfare sector, one which "foreshadows, at least potentially, the mode of distribution of the future" (Mandel 1968, 657). Erik Olin Wright thinks that state institutions in social democracies which specialize in the decommodified production of public health, education, public recreation, and so forth, "should be regarded as also constituting elements of an *embryonic postcapitalist mode of production*" (1997, 463). Since under the communist mode all costs would be socialized and all goods would become public, there is a sense in which communism is the ultimate welfare state.³

How Marx justifies the move from market distribution to the ultimate welfare state constitutes the topic of my article. Having once sided with the prevalent view that Marx defends the choice of communism over socialism (the transition period with its market in consumption goods) by appealing to communitarian values (DiQuattro 1978), I have now come to encourage an interpretation attributing to Marx a sense of justice that does not differ fundamentally from that found in egalitarian versions of liberal theory. Communism is assuredly beyond markets, but it is not beyond liberal justice, as followers of Hume's criteria of justice have it. Indeed, for Marx, communism is the perfectly just society, and it is from this ideal that Marx works up his theory of exploitation and assesses the status of justice in precommunist societies. In what follows, I elucidate the liberal and individualistic roots of Marxian justice by focusing on the Marxian concept of exploitation. I set out the view that Marx has a general normative theory of exploitation derived from a model of a perfectly just society in which everyone, by virtue of personhood, is deserving of equal welfare. Accordingly, societies that deny this by permitting morally arbitrary factors to determine distributive shares stand condemned as exploitative and unjust. I begin clearing the path of analysis by dismissing the thesis that the labor theory of value, as a technical theory of exploi-

Arthur DiQuattro is Senior Research Associate, William O. Douglas Institute, 824 NE 94th Street, Seattle, WA 98115.

Some of the ideas in this paper were first presented at the annual meeting of the American Political Science Association, August 1990, San Francisco, and later at the Political Theory Convocation, Department of Political Science, Texas A&M University. I have benefited from comments by John Roemer and Danny Goldstick on earlier versions of this paper. Their disagreements with parts of my analysis prompted elaboration and revision. Thanks also to John Paddy Burke and Lyman Legters of the Douglas Institute.

¹ "From each according to ability, to each according to wants!" I later justify translating "Bedürfnissen" as "wants."

² "A public good is any good or service which is *de facto* provided for or subsidized through government budget finance" (Birdsall 1965, 235). In this definition, "publicness" is an act of legislative designation, not of any technical characteristics of the goods or services. It is a deliberately broad definition, circumventing narrow criteria of public goods, such as "indivisible in principle" or the more ideologically laced "what the market cannot produce" (Markovich and Pynn 1988, 48). In the broad definition, something such as the provision of health care can be either private (divisible and purchased individually in the market) or public (state-rendered indivisible and publicly available) depending on the decisions of the government's exchange branch. The expression "exchange branch" is from Rawls (1971, 282).

³ The nature of the communist state is for Marx different from that in class-divided societies (Schmitt 1987, 198–200). Furthermore, on the Marxian view, in capitalist economies there are structural limits on how far decommodification can proceed, entertainingly revealed in Wright's "parable of the schmoo" (1997, 4–9).

tation, has an important bearing on Marx's general normative theory of exploitation. Having dispensed with the labor theory, I proceed to delineate and defend a "property rights matching power" account of the general technical theory. And though this account draws on the work of John Roemer, it differs importantly by rejecting both his interpretation of Marx and his game-theoretic approach to exploitation. My aim is to bring Marx's general normative theory into line with contemporary theories of distributive justice advanced by liberal egalitarians, theories that stress the ideal of equal concern and respect for persons *qua* persons and require implementation of the ideal consistent with what historical circumstances permit. I conclude with some speculative comments about Kantian influences in Marx's sense of justice. I should add that I do not start from scratch in my consideration of Marx on the topics of morality, justice, and exploitation. In the debates over whether Marx believes exploitation is unjust, I am on the side that argues he does, and in this article I pursue and sharpen this interpretation, in particular in my analysis of Marx's criticism of the distributive principle of socialism.⁴

LABOR THEORY OF VALUE

If there is such a thing as the general Marxian theory of exploitation, by which I mean a technical and normative theory according to which inequalities generated by any economic system can be explained and ethically evaluated,⁵ then it does not matter that the labor theory of value is false. Even the most orthodox Marxists must agree to its irrelevance, since for Marx the labor theory of value finds application only in capitalist economies, whereas the general theory of exploitation covers all economic systems. The labor theory purports to explain the values of and ratios at which commodities exchange in competitive markets, indeed, only in competitive *capitalist* markets, since for Marx only in those markets does labor take on an abstract form.

In the first part of *Capital*, Marx conceptually ties together "abstract labor" and the "value" of commodities, with the theoretical result that commodities possess value only if produced by abstract labor. "A use-value, or useful article, therefore, has value only because human labor in the abstract has been embodied or materialized in it" (Marx [1867] 1965, 38). Since abstract labor is the numeraire commodity and accordingly essential to value calculation, only in capitalism can the labor theory of value do any explanatory work. Furthermore, as indicated below, *abstract labor* and the *value* it produces are not merely logical or theoretical

abstractions but, instead, concrete historical phenomena associated with the rise of capitalism.

Previous to capitalism, labor is mainly heterogeneous, employing specific facilities in distinct ways and generating products of determinate physical properties capable of satisfying particular wants. This power to satisfy wants stamps these products with use-value. But because use-values are themselves qualitatively different—precisely because the concrete labors that produce them are—they lack a commonality that renders them comparable for purposes of aggregation. On this account, they are not reducible to exchange-value and cannot constitute the factor according to which exchange-values are determined. There is a problem of aggregation here, analogous to that of the utilitarian's calculation of the interpersonal comparison of utilities. "The *very* fact that these different labour-times, expended in a capitalist economy, are added together means that they are treated as abstract labour-time. (One can no more add 7 hours of *concrete* coal-mining to 3 hours of *concrete* tea-making than one can add 7 apples to 3 oranges)" (Steedman 1977, 19).

In capitalism, labor gets stripped of its concrete particularity and is transformed into a simple, homogeneous, and aggregative form; it is labor as such, all types of labor rolled into one, universal, simple, the kind of labor that Adam Smith incorporated into his analysis. Paul Sweezy (1942, 31) notes that this reduction of labor to the common denominator of simple units is not an arbitrary abstraction forced on reality by the Marxist conceptual framework: "It is, as Lukács correctly observes, an abstraction that belongs to the essence of capitalism." Or as G. A. Cohen puts it, "under capitalism the abstract aspect [of labor] takes precedence *in fact* and in consciousness" (1974, 247, emphasis added).

Just why labor *actually* assumes this distilled form under capitalism has prompted different explanations from Marxist theorists. Does labor take on an abstract form because of the compelling *efficiency* of competitive capital and labor markets? Or is it because a deskilled, interchangeable, and mobile labor force assists managers in *controlling* workers in capitalist enterprises? These explanations are not always complementary and may be contradictory, as reflected in the tension implicit in Adam Smith's ([1776] 1982, chapter 1) description of the debilitated state of workers in his famous pin factory. Even in the face of his praise of the efficiency aspect of abstract labor, he called attention to the alienated, stunted human beings whose creative capacities and entrepreneurial talents were lost forever to productive endeavor. Unlike Smith, Marx had at his disposal a theory that accounted for the "contradiction." To paraphrase Marx ([1867] 1965, 486–8) and Engels ([1878] 1947, 441–4), "modern industry" (which develops the forces of production) compels the replacement of the detail worker, reduced to a fragment of a person by the division of labor, by the fully developed, multifaceted individual, adapted to a variety of social functions that gives free scope to his or her natural and acquired powers; but the capitalist character of modern industry, its relations of production

⁴ One of the best discussions of these debates is in Peffer (1990, chapters 4–7).

⁵ Following John Roemer, I distinguish throughout this paper between "technical exploitation" and "ethical exploitation." I am concerned with both. The former is a positive theory that explains how inequalities come about; the latter is a normative theory that morally assesses these inequalities (e.g., as just or unjust) and how they come about (e.g., justly or unjustly). See Roemer 1988, chapter 2.

(which sustain class power), generate a compliant, unifacted, subdivided, and “Taylorist” work force. This results in the “contradiction” that reproduction of class power gets in the way of the development of the forces of production, in particular, technology and the all-around development of human labor.

At any rate, on whichever side of the control-versus-efficiency debate the weight of argument leans (see Marglin 1976), Marx is of the view that abstract labor prevails only in capitalist market economies. “The abstract category ‘labor,’ ‘labor as such,’ labor *sans phrase*, the point of departure of modern economics, thus becomes a practical fact only there [the United States, the most modern form of bourgeois society]” (Marx [1859] 1970, 210). This means that the labor theory of value and its corollary, the theory of surplus value, cannot be an essential part of Marx’s general theory of technical exploitation. The labor theory explanation of allocation and distribution is limited to capitalism. The labor theory, for example, does not explain allocation and distribution in slavery or feudalism. In these societies, labor is still concrete and produces mainly use-values.

To say that abstract labor, and therefore value, prevail only in capitalism implies that the labor theory does not apply to simple commodity production, where independent producers, owning their own means of production, engage in market exchange. To some students of Marxism (e.g., Meek 1977, chapter 7) this is a controversial claim, since it seems to them that Marx, in the first part of *Capital* and after the manner of Adam Smith, initially employs the labor theory to explain exchange in simple commodity production, and only after asserting its validity there does he move on to apply it to capitalism proper. But this reading of Marx is off because the labor theory requires the existence of competitive capital and labor markets without which there would be nothing to compel the transformation of concrete labor into an abstract form and, as we have seen, minus abstract labor, there is no value, no law of value, and therefore nothing for the labor theory of value to explain. It suffices to refute the claim that the labor theory applies to simple commodity production to point out the absence of abstract labor there. When this is combined with a key element in Marx’s theory—that abstract-labor markets emerge through pressure and compulsion and are sustained only by competition in capital markets—we end up with a tight account of Marxist theory that looks like this:

Under simple commodity production the labourers are united by ownership with their means of production. As a result there is no free and unconstrained labour mobility from industry to industry, and no labour market. Hence there is no force which brings the labourers’ rates of remuneration into equality. Such equality is only possible with private ownership when the link between labour and its means of production is severed. This tallies with an argument . . . that the orthodox Marxian notion of “abstract labour” is only applicable to capitalism. Hence no homogeneous measure of labour time is possible under simple commodity production. The category of abstract labour is a reflection, according to Marx, of a situation

under capitalism where all forms of labour are united by the fact that they are exchanged on a market. Abstract labour, thus defined, has no material basis under simple commodity production (Hodgson 1981, 106; also see Morishima and Catephores 1978, chapter 7).⁶

POWER AND MATCHING PROPERTY RIGHTS

If the labor theory of value does not matter to the general theory, then what does? I argue that property rights do. In this respect, my argument resembles that of John Roemer, but it deviates insofar as it considers Marxian exploitation theory interesting for the same reason that property rights theory is.⁷ These theories are one and the same. My rendition of property rights theory stresses the role of power and the property rights matching it, which implies that the analytical Marxists are on to something in saying that “the Marxist condemnation of the injustice of capitalism is not so different from the conclusion that other and apparently less radical and contemporary theories of political philosophy reach, albeit in language less flamboyant than Marxism’s” (Roemer 1988, 5). In particular, I argue that Marx and liberal theorists such as John Rawls are the same in their ruling out, on the grounds of justice, the role of morally arbitrary influences in the determination of distributive shares. By way of getting there, I start with a tale spun by Milton Friedman (1962, 162, 165), which I embellish as follows.

Imagine four Crusoes shipwrecked on the high seas, with each happening to land on one of four proximate

⁶ John Weeks (1981) traces the idea that the labor theory explains exchange in simple commodity production to Engels and accounts for its popularity in light of its accession to authority in Soviet Marxism. His exegesis shows that, for Marx, “value systematically rules exchange only under capitalist relations of production and in no other system, historical or hypothetical” (p. 28). I think that empirical evidence backs up Hodgson’s and Weeks’s reading of the labor theory. For example, colonial North America resembled a simple market economy—one without significant capital and labor markets—and there the prices of exchanged commodities were not largely market driven. Prices were largely set by custom and prevailing (often religious) conceptions of justice, not by what the market would bear. Prices or “exchange values” of *this* kind can hardly be explained by the labor theory (see Henretta 1991; Kulikoff 1992). Marx ([1867] 1965, 765ff) himself characterized the economy of the American colonies as simple commodity production.

⁷ Roemer thinks that Marx’s general theory of technical exploitation is uninteresting because it relies on the labor theory of value. Throughout his work, Roemer contrasts his property relations definition of exploitation to that of Marx’s labor theory, referring to and “discarding” the latter as the “classic” or “traditional” definition of Marxist exploitation (1988, 11–2). Roemer (1994a, 97) considers an “unequal exchange of labor” definition of exploitation to be a “generalization of Marx’s,” and he writes that “capitalist exploitation turns out to be equivalent to Marxian exploitation, when labor is homogeneous and equally endowed to all” (1982, 29). My view differs from Roemer’s in asserting that property relations theory *is* Marx’s general technical theory of exploitation. Perhaps what leads to Roemer’s mistake is his belief that the labor theory applies to noncapitalist economies. He thinks, for example, that socially necessary labor time, as Marx conceives of it, exists not only in simple market economies but also in autarkic economies which lack exchange among producers (Roemer 1988, 16). For reasons I have already provided, this cannot be the case, since the fact of abstract labor, which is peculiar to capitalism, is a logical precondition of the existence of socially necessary labor.

islands, only one of which is rich in resources and the rest barren and inhospitable. The islands, previously unowned by anyone, fall prey to ownership claims, with the result that the lucky Crusoe, *X*, holds the rich property. Friedman implies the moral legitimacy of this distribution by appealing to the values of liberty and consent, which he drives home by analogy to lotteries. Unless everyone initially agreed (hypothetically, no doubt) to leave it to happenstance to decide distributive outcomes, everyone would be denied the opportunity to win the jackpot prize. Robert Nozick (1974) would place more emphasis on natural rights and their origin in being in the right (previously unowned) place at the right time (no one else got there first). But in spite of their different emphases, both Friedman and Nozick agree that brute luck can be ethically decisive in deciding who gets what, in this case effecting a configuration of property that advantages *X* relative to the other Crusoes. Continuing the tale, suppose that *X* expends some of his abundant resources to employ the services of individuals on subsequently discovered adjacent Pinkerton Island. The inhabitants of this island are a soldierly lot and especially suited to policing *X*'s productive assets.⁸ The Pinkertons' initial task is to prevent incursions upon *X*'s assets by the unlucky islanders, but their work extends to enforcing contracts. Since the unfortunate Crusoes can barely scratch out a living on their desolate properties, they bite at the Pareto-optimal offer to exchange their labor power for access to *X*'s island. For every five deer they jointly hunt and catch, they get to keep three, the remainder go to *X*, who gets two deer in comparison to their one each.

Two points need to be made at this point in the story, one bearing on the labor theory of value, the other on power and choice. First, we assume that though hardly any labor goes into their catch, deer are nonetheless highly valued because of their scarcity and utility on the poorer islands. Indeed, it costs twice the labor to catch beavers, which are abundant on the poor islands, but they have less value than deer because they yield less utility. Labor time does not determine the value of deer, whether it is the labor embodied at the time of the catch or the socially necessary labor time required at the time the catch is exchanged at the end of the week, when the workers give *X* five deer and get three back.⁹ What determines the value of the deer is their scarcity and utility, and what gets *X* his share of this value are the terms of the agreement negotiated with the other Crusoes. Is this a case of Marxian exploitation? The workers have hunted down what has value, even though their labor did not create that value. But

must not the charge of ethical exploitation still hold for Marxists because *X* appropriates some of the value "even if wholly determined by the extent and intensity of desire for it" solely on the basis of his ownership of scarce and useful resources (Cohen 1980)? Even if we worked up this illustration into a full-blown capitalist market system, complete with competing capitals and capitalist supervision of work, the labor theory could be false, and the charge of exploitation still convincing.

This fundamental point receives sophisticated and mathematical treatment in the various models Roemer constructs to illuminate how Marx's normative concerns need not depend upon the labor theory of value. Roemer shows how all sorts of arrangements, developed in stories like the one above, count as ethically exploitative even in the absence of the unequal exchange of labor, which he (wrongly) takes to be at the heart of Marx's general technical exploitation theory. Leaving the mathematical models aside, consider once again the Crusoe fable. Instead of *X* hiring out the other Crusoes, he lends them some deer to breed on their islands. He charges interest in the form of a cut of the deer's offspring. Assume, further, that deer-breeding involves no labor on the part of the Crusoes and that all of them, including *X*, work the same amount of socially necessary labor time in catching deer. But *X* ends up with more deer than he catches. Not because he works less than is socially necessary to catch deer, but because he owns scarce resources that he has lent out at interest.¹⁰ Labor has hired capital, and, as a consequence, technical exploitation emerges through the credit market. Moreover, Roemer shows in another of his models that technical exploitation can result without either labor or credit markets. It can also result from initially unequal resource distribution plus trade (as Marx understood; see Elster 1985, 181–2). In the Crusoes scenario, the trade advantage would accrue to *X* since he owns the more valued deer; in exchanging them for the less valued beaver, he would get the better of the deal even though, let us suppose, it costs twice the labor to catch beaver than deer.

Oskar Lange, one of the pioneers in meshing neo-classical formulations with Marxian exploitation theory, more than fifty years ago captured the basic idea underlying this kind of analysis of exploitation. He stressed as the distinguishing feature of Marxian economics its emphasis on the "institutional datum" or class relations of society and pointed out the lack of advantage the labor theory has over the property relations account of technical exploitation.

Thus the labor theory of value has no qualities which would make it, from the Marxist point of view, superior to the modern more elaborate theory of economic equilibrium. . . . In the Marxian system the labor theory of value serves also to demonstrate the exploitation of the working class under capitalism. . . . But the same fact of exploitation can also be deduced without the help of the labor theory of value. . . . If interest is explained by the marginal

⁸ I leave aside the whole issue of why the Pinkertons contract with *X* rather than simply take his island. As far as the point of this tale is concerned, we could just as well have imagined that the shipwrecked Crusoes, having landed on the poor islands, found themselves adjacent to the rich island already occupied by the Pinkertons.

⁹ I am not saying that this part of the story captures what goes on between capitalists and workers in a capitalist market system. There, workers get paid wages for laboring a set time. This allows the bosses to keep as many deer as the workers can be pressured to catch, while keeping their wages down to the contractual limit of three deer.

¹⁰ The deer are scarce relative to the demand of the poor Crusoes. They are not scarce relative to the demand of *X*. In this case, scarcity is created by the system of property rights, and *X* undergoes no disutility or "waiting" by giving credit to the poor Crusoes.

productivity theory of capital, it is only because the workers do not own the capital they work with that interest is the personal income of a separate class of people. If interest is regarded as due to a higher valuation of present rather than future goods it is only because the workers do not possess the subsistence fund enabling them to wait until the commodities they produce are ready that the capitalist advancing it to the workers gets the interest as his personal income. Just as in Marx's case it is because the workers do not possess the means of production that surplus value is pocketed by the capitalist (Lange [1935] 1968, 77–8).

If none of this persuades about the irrelevancy of the labor theory, assume that instead of *X* contracting with the other Crusoes he forces them to work for him, as in feudalism. This is the clincher in the argument that the labor theory is dispensable to Marxian exploitation theory. Serfs do not produce value, according to Marx (for the reasons covered in the first part of my article); yet, as Cohen (1980, 155) says, “if anything, [feudalism] is the *paradigm* of exploitation in Marxism.” *X* uses the Pinkertons (in feudalism, many of the *X*'s are Pinkertons) to compel directly the other Crusoes to catch deer so many days a week, giving over to *X* as many deer as required by political command and consistent with the minimal consumption needs of the serfs. Here use-value reigns supreme; there is no value, no place for socially necessary labor (by definition, the quantity of abstract labor required at the time of market exchange), and hence no way of explaining technical exploitation by the labor theory. Still, Marx dubs feudalism as exploitative. So how can his general theory of exploitation consist in, or be based on, the labor theory?

True enough, Marx explains how inequality comes about in feudalism by noting that serfs produce a surplus product from the labor they expend beyond what goes to themselves. But this talk about necessary and surplus labor does not imply that Marx's explanation is based on the labor theory of value. The serf's surplus product does not possess surplus value; if anything it possesses surplus *use-value*. Since, in feudalism, it is impossible to say that serfs produce value and to measure their socially necessary labor time, it cannot be said that lords end up with the surplus-value generated by the socially necessary labor of the serfs. Inequality cannot be explained in terms of the unequal exchange of labor, as in the labor theory, since that entails the aggregation of abstract labor. Lords do end up with appropriating part of the use-value of products, but in feudalism use-value is not (cannot be) calculated in terms of abstract labor time. What the lord gets is an amount of use-value that is determined by a combination of custom and coercion; that is, property rights backed by power. Cohen is right that feudalism, not capitalism, is the paradigm of exploitation in Marx. It is because capitalism is like feudalism that the former is exploitative. Roemer puts things backward in portraying capitalist exploitation as the model of Marxian exploitation theory (“capitalist exploitation turns out to be equivalent to Marxian exploitation”; see footnote 7 above), and this is why he fails to see that the Marxian

theory of exploitation is interesting for the same reason that property relations theory is.

Consider, finally, this twist in the story, which leads into the promised consideration of power and choice in Marxian exploitation theory. The asset-poor Crusoes overthrow *X* and his goons, redistribute property, and end up with an equal share of collectively held alienable productive assets. Socialist property rights supplant feudal and capitalist ones (whether by “skipping stages” need not concern us), and now all the Crusoes have free access to hunting deer. Now according to a certain definition of exploitation (e.g., Reiman 1987), which is supposed to elicit an understanding of Marxian exploitation, socialism and exploitation are mutually exclusive. This is because (1) there are no classes in socialism, and (2) workers control the workplace in socialism. This account includes *classes* as a necessary condition of Marxian exploitation: A society is exploitative when unpaid labor is forced out of one class and put at the disposal of another. It also insists that this surplus is squeezed out of workers at the point of production. For example, in capitalism the bosses organize the workplace to maximize the production of surplus value; to make the most of the labor power the worker has sold to the capitalist for a set time.

But how can there be an affinity between this definition and Marx's if Marx intimates that socialism itself involves exploitation? In the *Critique of the Gotha Programme*, Marx expresses dissatisfaction with socialist distribution—to each according to work—despite the absence of classes and coercion in the workplace. Marx thinks there is something ethically amiss here because, even though everyone has property rights in alienable means of production (deer, in my example) and the principle of distribution “recognizes no class difference since everyone is only a worker like everyone else,” some workers get larger consumption bundles than others irrespective of the concern for equal welfare ([1875] 1955, 24). Marx is bothered that “one will be richer than another” (p. 24), signifying that an unequal distribution of welfare, even when it does not result in class division (as Marx defines it), is of normative importance to Marx. That this is so tips us off that the core of Marx's general theory of exploitation no more requires classes than it does workplace domination or the labor theory of value.

For Marx, a problem arises in socialism because nonalienable assets (e.g., hunting talents and skills) are unequally distributed among the workers so that those Crusoes with superior endowments are able to get more deer, either as a consequence of working longer (due to their physical endurance) or working less but catching more deer (thanks to talent, cleverness, etc.). Since the main distributive standard is “to each according to duration and intensity” of labor performed, individuals who are “superior to others physically and mentally” can cash in on their fortuitous endowments or “natural privileges” (Marx [1875] 1955, 24). The “right” to a greater income stems from a property right in human capital, which is unequally distributed. Differential power to produce relatively more of those things geared for production by the social plan is thus

given an important place in deciding distributive outcomes.

Notice that, for Marx, in socialism *an unequal exchange of labor is not a necessary condition for exploitation to occur*. For example, *A* and *B*, engaged in joint production, may work the same amount of labor time and receive equal wages, but *B* may be prone to greater fatigue or have greater wants than *A* that cannot, moreover, be satisfied by the limited amount or kind of public goods available in the decommodified sector. Marx talks about *B*'s being married, having more children, and "so on and so forth" than *A*, so that *B*'s wants (quantitatively or qualitatively understood) cannot be satisfied by the expenditure of income generated by labor ([1875] 1955, 24). The distributive standard of socialism allows *A*, who benefits from *B*'s participation in joint production, to exploit *B* by denying *B* want satisfaction equal to *A*'s. This is defective from the standpoint of Marxist justice. It is this moral defect that prompts Marx to refer to the distributive standard of socialism as "stigmatized by a bourgeois limitation," a not unsurprising characterization, since the transition period contains both bourgeois muck and communist promise ([1875] 1955, 23). As we shall see, which way this transition tilts turns on the competition between contending ideas of justice.

For Marx, the most important determinant of distributive outcomes in capitalism is class structure and its matching system of property rights. Class relations are power relations, and they find expression in property institutions. "Find expression in" is an obscure Marxist way of saying that property rights are legal relations tied contingently to power relations. Cohen (1978, chapter 4) reads Marx as treating property rights as a legal category connected functionally to power relations, with property rights "matching" power relations in a way that the latter explain the former. In all class-divided societies, one class holds the means of production; another class, lacking free access to these means, is under a combination of political and economic pressure to surrender a part of the social product to the owning class. But *class* power is not the only determinant of distributive inequality, especially in capitalism, whose system of property rights matches both class power *and* the power of individuals generally. That Marx understood this is indicated in his criticism of "crude communism" in the *Manuscripts*, one which, as Shlomo Avineri (1968, 225–6) says, "closely resembles the account of socialism given in the *Critique*." In both places, Marx focuses on *individuals*, who during the transition period suffer the consequences of left-over bourgeois norms and practices.

Though there is a difference in emphasis—in the *Manuscripts* Marx attacks wage equality because it results in invidious comparisons among individuals, and in the *Critique* he criticizes wage inequality because it is unfair—Marx consistently condemns the infectious bourgeois strains of social alienation and welfare inequality that carry over to individuals in socialism. Marx is keenly aware that capitalism differs from other social formations by releasing individuals from previous customary and political restraints on egoistic be-

havior, with the market providing the procedure wherein individuals can and *must* use their power to bargain for advantage. The market, as a *distributive* device, forces among individuals a self-interested rationality geared to the competitive struggle for existence. It provides no insurance that those who lose out in the competitive game will be compensated for their loss, and it leaves its players no choice but to join in the fray in the hope of furthering advantages or maintaining positions. Indeed, as Hobbes knew so well about the competitive game, the maintenance of position translates into the seeking of advantage over others, such that even merely self-interested persons graduate to egoism under the pressure of unrestrained competition (see Macpherson 1962, chapter 2).

What is involved here is ironically exposed by libertarian defenders of capitalism. Friedrich Hayek (1976, 94) writes: "Our only moral title to what the market gives us we have earned by submitting to those rules which make the formation of the market order possible." The rules are those of the game of "catallaxy," which "spontaneously" yield the right moral result, a result dubbed "just" precisely because it is the outcome of people's acting within the market rules of the law of property, tort, and contract. Like most games, the outcome results from "a contest played according to rules and decided by superior skill, strength, or good fortune" (Hayek 1976, 115), which to Milton Friedman reduces to the latter. For Friedman, despite the lip service that we all pay to "merit" as compared to "chance," market distribution is akin to a game or lottery that everyone agrees to enter with the anticipation of winning a jackpot prize. "Most differences of status or position or wealth can be regarded as the product of chance at a far enough remove," so that it is luck which determines largely who gets (and should get) what in capitalist market society (Friedman 1962, 165–6). If one is fortunate enough to be born into a wealthy family,¹¹ or to be born in a part of the world rich in natural resources,¹² or to have certain naturally or socially acquired characteristics that fetch high market prices,¹³ or to make profitable investments under conditions of uncertainty,¹⁴ then one qualifies

¹¹ For example, 67% of the large fortunes in the United States are derived from inheritance (Brittain 1978).

¹² Consider, for example, how the natural animal resource distribution hundreds of years ago affected the consequent world distribution of economic and political power. Successful mammal candidates for domestication—the cow, sheep, goat, pig, and horse—were found almost exclusively in Eurasia, giving its population long-lasting advantages over human populations on other continents (especially sub-Saharan Africa). These animals provided meat, fertilizer, wool, hides, milk, labor, and means of transport prior to the Industrial Revolution. And in war, there is the standout example of Eurasia's horses in the European conquest of the Aztec and Inca empires, not to mention the even more devastating infectious diseases carried by imported domesticated animals that decimated non-Eurasian peoples lacking prior exposure. See Diamond 1994, 1997.

¹³ On the multitudinous and subtle ways that luck significantly influences social mobility in market societies such as the United States, see Jencks 1979.

¹⁴ Christman (1994, 89–95) makes a good case that the entrepreneur is undeserving of profit because it results from imperfect market conditions for which s/he is not responsible.

for disproportionate rewards. Coming to the marketplace with whatever resources or factors of production they “happen” to own, individuals engage in exchange and are aware that the initial distribution of property rights affects the outcome. The bourgeois principle—“To each according to what he and the instruments he owns produces”—calls on individuals to accept the resulting distributive configuration as “just” (Friedman 1962, 161–2). Justice is here reduced to a market concept, far removed from any nonmarket standards identified in “substantive” (Hayek) or “patterned” (Nozick) terms conforming to overarching social ends or purposes. Justice is the outcome of the pure procedure peculiar to the market. It describes the result of market competition and sanctions the successes of the lucky, the cunning, and the powerful.

Thinkers such as Hayek, Friedman, and Nozick are embarrassed by this procedural result, prompting their convoluted treatment of the theory and practice of liberty. Friedman (1962, 14) conflates choice with liberty, asserting that all choices in market capitalism are “strictly voluntary.” Nozick (1974, 262–4), the more sophisticated of the bunch, redefines liberty so that its presence finds detection paradigmatically only in exchanges that take place in the context of capitalist property relations. For Nozick, by definition, owners of “properly-acquired” property do not possess any economic power and cannot logically force anyone to come to terms.¹⁵ And for Hayek (1976, chapter 10), since coercion implies personal intention and responsibility, there can be none exercised in the marketplace, which coordinates things in impersonal fashion and with unforeseen consequences.

Frank Knight, Friedman’s mentor,¹⁶ knew that moves like these are all a sham. In “The Ethics of Competition,” one of the few honest defenses of capitalism I have ever seen, Knight goes down the list of the fashionable ethical defenses of capitalism and finds all of them wanting. Capitalist markets systematically reward luck, not moral desert; they work to undermine the virtues of friendship and moral excellence and, most important, substitute for them the “ethics of power.”

Everyone is compelled to play the economic game and be judged by his success in playing it. . . . The luck element is so large—far larger than fairly successful participants in the game will ever admit—that capacity and effort may count for nothing. And this luck element works cumulatively, as in gambling games generally. . . . Differences in the capacity to play the game are inordinately great from

one person to another. But as the game is organized, the weak contestants are thrown into competition with the strong in one grand melee; there is no classification of the participants or distribution of handicaps such as always recognized to be necessary to sportsmanship where unevenly matched contestants are to meet. In fact the situation is worse still; there are handicaps, but as we have seen, they are distributed to the advantage of the strong rather than the weak. . . . It is in terms of power, then, if at all, that competitive economies and the competitive view of life for which it must be largely accountable are to be justified. Whether we are to regard them as justified at all depends upon whether we are willing to accept an ethics of power as the basis of our world view (Knight 1935, 64–5, 68).¹⁷

The role that power plays in assigning distributive shares in capitalism is an unwanted legacy bequeathed to socialism, one of the “birth pangs of the old society from whose womb it emerges” ([1875] 1955, 23). It is the basis of a distributive standard and practice based on “bourgeois right,” as we have seen Marx put it, or what Rawls (1971, 65–83) calls the systems of natural liberty and liberal equality, according to which individuals are forced to compete for outcomes with whatever resources they happen to have. “Natural liberty” requires only formal equality of opportunity whereas “liberal equality,” the more meritocratic, concedes the need for fair equality of opportunity, yet both permit the distribution of goods according to natural and social contingencies. The initial distribution of naturally or socially acquired powers, when mediated by the distributive standard of socialism, yields differential outcomes. The legitimizing principle is “equality of opportunity,” both formal and fair, to secure advantage.

What is wrong with socialism, then, is that it permits universal exploitation among individuals. Its distributive principle justifies the use of power to gain advantage with the consequence that welfare gets distributed not according to wants possessed by persons qua persons but persons as possessors of differential power, and this constitutes a morally arbitrary basis for the distribution of welfare. Marx rarely says explicitly, as in the quotation which concludes this section, such a Kantian-sounding thing, but it is, I venture, the plausible interpretation of his theory of ethical exploitation and the sense of justice underlying it. Marx is for everyone having his or her wants satisfied equally. Welfare equality is the aim of communism, Marx’s good society in which the productive forces

¹⁵ Nozick writes: “A person’s choice among differing degrees of unpalatable alternatives is not rendered nonvoluntary by the fact that others voluntarily chose and acted *within their [capitalist property] rights* in a way that did not provide him with a more palatable alternative. . . . [Whether other people’s option-closing] action makes one’s resulting action nonvoluntary depends on whether these others *had the right* to act as they did” (1974, 262–4, emphasis added). Cohen (1991, 226), reviewing Nozick’s argument, observes that “it should be clear that ‘libertarian’ capitalism sacrifices liberty to capitalism, a truth its advocates are able to deny only because they are prepared to abuse the language of freedom.”

¹⁶ Friedman studied under Knight at the University of Chicago’s Department of Economics.

¹⁷ The thrust of Knight’s essay is that this justification does not mesh with the ethical point of view. “Thus we appear to search in vain for any really ethical basis of approval for competition as a basis for an ideal type of human relations, or as a motive to action. It fails to harmonize with either the Pagan [Greek] ideal of society as a community of friends or the Christian ideal of spiritual fellowship. Its only justification is that it is effective in getting things done” (1935, 74). When this point is added to Knight’s view that alternative economic systems (e.g., socialism) fare even worse with respect to liberty and the ideals he mentions, we have his defense of market capitalism. It is the least worse of all possible worlds, surely a less flashy defense than we find in Nozick, though socialists would insist that Knight’s opposition to socialism rests on an honest mistake.

have been developed sufficiently to accomplish this distributive ambition.

Welfare equality differs from resource equality. That Marx is a welfare egalitarian shows up in his rejection of wage equality (*Manuscripts*) and in his strategy of enlarging the public goods sector to achieve communism (*Manifesto* and *Critique of the Gotha Programme*). This contrasts Marxist egalitarianism to that of theorists such as Rawls and Dworkin (1981a and b), who advocate an egalitarian distribution of resources (e.g., wealth and income) and leave it up to individuals to use or expend most of them in a market setting.¹⁸ The Rawls-Dworkin approach attracts some egalitarians because it is inspired by a concern with individual choice and responsibility, but its weakness has been underscored by other egalitarian theorists (e.g., Cohen 1989), who argue convincingly that resources are often a bad proxy for welfare. They ask: Is it not welfare that resources are supposed to provide, why resources are important? The telling cases are those of individuals who suffer severe disabilities or who have expensive tastes, neither of whose deprivations are adequately addressed by equal distribution of resources. Clearly, Marxists side with the strategy that best accords with egalitarian intuitions. But if so, then what kind of welfarist is Marx, assuming that welfare translates into preference satisfaction?

Marx's criticism of Bentham for confusing the preferences and utilities of the English shopkeeper with those of people in other classes and different historical periods (Marx [1867] 1965, 609) and Marx's theory of false consciousness, which distinguishes between subjective preferences and objective interests, demonstrate that though he begins his analysis with people's extant, subjective preferences, he does not end there. As Buchanan interprets him, Marx distinguishes between distorted and undistorted preferences or desires, describing communism as a unique form of social life because of the absence of the malformed desires that go with the roles people occupy in class-divided societies. It is from the standpoint of the preferences that people would have or would develop in communism that preferences prevailing in precommunist societies receive ethical evaluation (Buchanan 1982, 27–31).¹⁹ I

will say more about this later, given its relevance in securing to Marx liberal credentials, but for now it will do to say that Marx is interested—in his ethical theory—in that kind of welfare involving ideally considered preferences, what Arneson (1990, 163) calls “hypothetical rational preferences” and what Cohen (1989, 909n) includes as belonging to a type of “objective theory of welfare.” Notice that treating wants in this counterfactual way conflates wants with needs, rendering it conceptually easy to say that wants, “as corrected by full information and considered reasonable judgment” (Arneson 1987, 527n), mean nothing less or more than needs, the basic intuition being that what a person needs is what s/he would ideally prefer. Arneson (1990, 191) writes: “The conviction that mere preferences [ideally considered] are analytically distinguishable from true human needs may prove to be illusory.”²⁰ This is similar to the view of Marcuse (1964, 4–6), nicely condensed by Miller (1976, 129–30): “Marcuse is claiming that under conditions of freedom individuals' preferences are to be taken as defining their needs, but not otherwise.”

But even if one resists this conceptual compression, as does Braybrooke (1987), it seems both lexicographically and theoretically warranted to read Marx, in *Critique of the Gotha Programme*, as talking about wants, not needs, which is what Braybrooke himself asserts. He notes that *Bedürfnisse* expresses variably the concepts “want” or “need,” and that when Marx uses the word he is frequently translated as meaning “want” (e.g., he defines use-value as the power to satisfy wants; and there is the famous reference to labor as “life's prime want”). Braybrooke thinks that the best way to fill in Marx's communist principle of distribution—“to each according to”—is with *wants* because needs fail to gel well with Marx's theoretical emphasis on the infinitely expandable desires made possible (if not driven) by the development of the forces of production, which reaches its apex under communism. Because these desires are so Promethean, it is likely that Marx was not thinking of needs “strictly speaking, derived or otherwise,” but of wants “whether or not the wants answered to needs” (Braybrooke 1987, 239). Or as Ignatieff (1985, 125) puts it: “The task of human progress [for Marx] was to increase the productivity of labour so that all human beings could be freed from the slavery of basic need to embrace the free choice of desire.” It is an added benefit of this interpretation that it comports with the mature (post-*Manuscripts*) Marx's rejection of strong talk about a universal human nature and with his dismissal of appeals to “truly human nature” as a way of grounding the ethical worth of communism. An objective theory of welfare differs from more traditional—nonliberal and perfectionist—

¹⁸ Rawls and Dworkin allow for public provision to accommodate urgent wants, but their main distributive device is the market. Rawls makes it difficult for the government's exchange branch to trade private for public goods if the basic institutions are already ordered according to his two principles of justice. Following Wicksell, he requires a near-unanimous vote to accomplish the trade. For criticism of Rawls on this point, see Krouse and McPherson 1988.

¹⁹ Buchanan (1982, 54) thinks that Marx's theory “admits of either an objectivist or subjectivist, perfectionist or welfarist reading [and that] Marx neither specifically addresses this question nor writes anything that definitively commits him to one or another response to it.” Allen (1973) argues that the texts favor a welfare reading. If Marx is a welfarist, more needs to be said about (1) how justice rules out certain kinds of welfare and (2) how far a welfarist is committed to the satisfaction of expensive preferences in the face of scarcity of resources. Marx, I think, handles the first satisfactorily but has little to say about the second, perhaps because he assumes a lack of scarcity in communism. The analysis of contemporary egalitarian theorists who are not as optimistic as Marx on the scarcity issue, yet who are sympathetic to Marx, is highly useful (e.g., Cohen 1989).

Schwartz (1995) thinks Marx is *dangerously* utopian on the scarcity issue.

²⁰ The conceptual tie between wants and needs is analogous to the conceptual compression of informed preferences and interests, as found in Mansbridge 1983 and Goldstick 1994. For more on the objective theory of welfare, see Railton 1986 and Brandt 1979. Wood (1990, 33), who disapproves of this theory, names it “idealized preference naturalism.”

theories that rest heavily for their justification upon thick claims about needs peculiar to an unchanging human nature.

Leaving behind this excursus on Marx and welfare theory, and returning to Marx's criticism of socialism, I conclude this section with the reminder that for Marx socialism gives way to communism through the abolition of (alienated and "necessary") labor and the enlargement of the public goods sector. Communism is the "realm of freedom," the freedom for all *to* satisfy freely developed wants and the freedom *from* a system of exploitation that allows some to realize their wants only at the expense of others. "In the place of the old bourgeois society . . . we shall have an association in which the free development of each is the condition for the free development of all" (Marx [1848] 1962, 54).

COMMUNIST JUSTICE

Is communism also the realm of justice? My argument suggests an affirmative response. I want to say, in agreement with Elster (1985) and taking issue with Lukes (1985) and others, that Marx has a "hierarchical" or ideal theory of justice according to which an equal distribution of welfare counts as a perfectly just distribution.²¹ Marx subscribes to an ideal theory that determines what is the nearest thing to full justice in less than favorable historical circumstances, so that historically prior distributive principles provide second-best criteria of justice. Unless we read Marx in this way, we cannot make sense of his criticism of precommunist societies, including socialism, as unjust. The fact that Marx sometimes characterized slavery, feudalism, and capitalism as exploitative even during their heyday, when they still played a role in developing the forces of production on the historical stage and while their own ideologies of justice held sway, implies that Marx was working with ethical criteria external to those systems. And his criticism of socialism implies that the distributive principle of socialism cannot constitute the ideal evaluative perspective. Lukes (1985, 70) is wrong in claiming that "Marxian exploitation counts as such only when set against the external standard of justice provided by the contribution principle of socialism," as is Buchanan (1982, 59) in arguing that "for Marx, the very need for principles of distributive justice is conclusive evidence of defects in the productive processes that form a society's core."

For thinkers such as Lukes and Buchanan, Marx's communism is beyond justice. "The superiority of communism is not that it finally solves the problem of distributive justice, rather it makes the whole issue of justice otiose" (Buchanan 1982, 59). This not unpopular view, in recent times resurrected by Rawls, is inspired by Hume's criteria of justice, which include

scarcity and conflict of the kind absent from Marx's image of communism. But why should we let Hume's conceptual fiat forbid us to ascribe justice to a society lacking in his circumstances? Hume himself is unclear about what it means to say that a society failing to meet his criteria is beyond justice, his wording suggesting something less and other than the conclusion that there is no place for the *concept* of justice in a society such as communism. Hume ([1777] 1968, 185–8) talks about appeals to justice being "suspended" or "useless." But does it follow that a society in which *appeals* to justice are moribund is neither just nor unjust, that the *concept* of justice has no place? Why might not the society be so just that there are few, if any, occasions for anyone to protest injustice or claim justice? In a qualifying passage in *A Theory of Justice*, Rawls writes that

a society in which all can achieve their complete good, or in which there are no conflicting demands and the wants of all fit together without coercion into a harmonious plan of activity, is a society *in a certain sense* beyond justice. It has eliminated the occasions when the appeal to the principles of right and justice is necessary [in a footnote, Rawls mentions Marx's communism as beyond justice in this sense]. I am not concerned with this ideal case, however desirable it may be. We should note though that even here the theory of justice has an *important theoretical role*: it defines the conditions under which the spontaneous coherence of the aims and wants of individuals is neither coerced nor contrived but expresses a proper harmony consistent with the ideal good. I cannot pursue these questions further. The main point is that the principles of justice are compatible with quite different types of regime (Rawls 1971, 281–2, emphasis added).

The Rawlsian version of Hume's criteria suggests that from the standpoint of ideal theory, with its emphasis on the theoretical role of justice, it is sensible to characterize a society lacking scarcity and conflict as just—indeed, as *perfectly* just. Plato and Aristotle inhabit this tradition in ideal theory. In their ideal states (kingship and aristocracy, respectively), citizens and noncitizens occupy their proper roles and shape their wants in accord with them. In their justly ordered paragon states, there is neither conflict nor scarcity, and it is from the vantage point of their models that they evaluate actual states. My point, of course, is not that Marx's good society resembles Plato's or Aristotle's. In important respects its egalitarianism, especially its antipathy to the division of labor, renders it antithetical. Marx is one, however, with the classical distinction in political philosophy between the ideal and the actual, assessing the latter in light of the former, and doing so without falling into the trap of utopianism. Marx is no utopian; he has no quarter with schemes that try to institute ideals prematurely. He justifies exploitation in history even in the face of his characterization of it as unjust. It is justified because it is an essential ingredient in developing the forces of production, and that development is a necessary precondition for the perfectly just society—communism—the practical vantage point

²¹ I may not be in complete agreement with Elster if, for him, "self-realization" means something other than the type of welfare I have attributed to Marx. If welfare is understood differently, especially as hedonistic, then self-realization and welfare may contrast, as they do for Roemer (1994b, 11–2). Note that I have equated welfare with preference satisfaction, which covers preferences for self-realization, and not with an agreeable state of consciousness.

from which the justified exploitation of the past is condemned as unjust.²²

Marx's justification of exploitation is neither (1) a species of "the end justifies the means" ethics, in the pejorative sense that evil means are deliberately chosen from an array of viable options, nor (2) a morally incoherent idea. First, Marx's justification of exploitation needs to be understood in the context of his theory of history that accounts for exploitation. In Marx's theory, class oppression and exploitation are likely a necessary condition for the development of the forces of production up to the point at which the creation of a massive surplus and parallel cultural accomplishments set the stage for communism. "Class oppression is necessary to bring society to [the socialist and communist] stage[s] of productive development. . . . The oppression of one class by another [is] an inevitable cost attached to [the] technically necessary differentiation [entailed by the division of labor]" (Cohen 1978, 207, 211). Far from recommending exploitation, Marx takes it to be an inevitable injustice which, in a way I suggest below, receives ethical scrutiny from the standpoint of communist justice.

This sense of justification can be found even in the theory of history of Kant, the last theorist to whom we would think of attributing an "end justifies the means" ethics. Kant accounted for the "cunning of nature" (on this expression, see Yovel 1980) at work in history according to which exploitation and other evils unwittingly prepare humanity for that which is also morally demanded. In his historical and political work, writes Kain (1988, 16, 44), Kant argued that "the historical development of culture and social institutions is a necessary presupposition for the possibility of morality . . . [and that] antagonisms, propelled by vainglory, lust for power, and avarice, activate us and cause us to develop our powers and capacities. In time, Kant thinks, such a society will be transformed into a moral whole." For Kant, the main antagonists are nations, for Marx they are classes, "but aside from this . . . the notion of a conflict of particular interests leading toward what would be demanded by the categorical imperative is much the same for both Kant and Marx" (Kain 1988, 44). Yet, neither Marx nor Kant recommends injustice when it can be avoided, and neither preaches acceptance of exploitation when historical openings permit its amelioration or elimination. Their explanations of injustice should not be mistaken for their sanctioning it, when avoidable.

Second, the idea of justifying exploitation is ethically coherent and can be located in the best of what are commonly designated nonconsequentialist theories. Rawls (1971, 542), for example, justifies the sacrifice of rights and liberties if it "is necessary to enhance the quality of civilization so that in due course the equal freedoms can be enjoyed by all." Even slavery is

justified if historical circumstances impose a choice between slavery and alternatives even less just (Rawls 1971, 248). In Marx's case, exploitation is justified because, according to historical materialism, exploitation is a necessary precondition for the attainment of a civilization free from exploitation. And each form that exploitation takes throughout history is justified during its period of vitality because it is progressively less unjust. Feudal injustice is morally preferable to the injustice of slavery, capitalist injustice is preferable to feudal injustice, socialist injustice is superior to capitalist injustice, all the way up to communist justice, which sets the standard of assessment and, consistent with Marx's antiutopianism, establishes the guidelines for moral praxis: Settle for the least unjust form of exploitation from the choices on the historical agenda; struggle against exploitation when it is historically feasible and hence not counterproductive. Within these limits, Marx ([1844] 1964, 52) appeals to "the *categorical imperative to overthrow all those conditions* in which man is an abased, enslaved, abandoned, contemptible being." As Yack (1986, 256) puts it, "Marx obliges us to attack the *conditions* that fail to respect man's humanity. If Kant demands that we overcome heteronomy in the will, Marx [inspired by the leftist Kantians] demands that we overcome heteronomy in the world."

It is because Marx sometimes represents societies as ethically exploitative in their historical prime that Roemer's counterfactual definition of exploitation misses the Marxian ethical point that it is supposed to capture, and it does so because it substitutes an aggregative principle for Marx's distributive one. According to Roemer's game-theoretic definition, people are ethically exploited if they *would be better off* in the event that the distribution of the means of production were rendered more egalitarian. "A group of people S is exploited by its complement S' in a society with private ownership of the means of production if S would benefit, and S' would suffer, by a redistribution of ownership in the means of production in which each owned his per capita share" (Roemer 1994a, 97). On this definition, serfs were feudally exploited if they would have been better off had the distribution of feudal property been egalitarian, which is to say if feudal lords had not controlled the labor of serfs. The abolition of feudalism would still leave us with capitalism. And workers are capitalistically exploited since they would be better off if the distribution of property under capitalism were egalitarian, which is to say if capitalists did not own the bulk of the alienable means of production.

Now, if we go along with this definition of exploitation, it follows that a society is not ethically exploitative prior to its historical task in developing the forces of production; that feudalism, for example, was not exploitative during the period when a more egalitarian distribution of property would not have improved the welfare of the serfs. Yet, Roemer knows that Marx considers feudalism and capitalism exploitative during their period of bloom. "Historical materialism," writes Roemer, "claims that each form of *exploitation* is socially necessary from a dynamic point of view," and

²² "From the moment the workingmen class movement became real, the phantastic utopias evanescenced, not because the working class had given up the end aimed at by these Utopists, but because they had found the real means to realize them" (Marx, first draft to *The Civil War in France*, cited in Elster 1985, 218).

the view that "early capitalist society was not unjust, assuming that capitalism was an optimal economic structure for the development of the productive forces, and even for human welfare, at that time... is a noncredible position" (1988, 145, 144, emphasis added). Thus, we get Roemer's conundrum: On his game-theoretic definition, there is no exploitation in feudalism, capitalism, and so forth, during their heyday, but on the Marxian and credible account there is exploitation, as in the concept of "socially necessary exploitation" that Roemer (1988, 143-7) tacked on in his more recent theorizing, trying to accommodate his original theory to Marxian concerns. But this latter concept counts not so much as an amendment to the game-theoretic approach as a contradiction. It goes against the grain of the general theory forced by the game-theoretic methodology, with its neoclassicist emphasis on aggregative principles. On my reading (which attributes to Marx the ideal of equal welfare), and on Roemer's admission, Marx condemns exploitation on *distributive* grounds, so that even if exploited "coalitions" would suffer an aggregate reduction in their average or total welfare in the event that they were to withdraw their per-capita share of assets from their extant situation, they still would count as being ethically exploited. This reflects both the Marxist and an intuitive sense of justice and thus has the advantage over the game-theoretic approach as a way of elucidating the Marxian project.

For Marx, the development of the forces of production is a necessary precondition for communism but, as Moore (1980) has argued persuasively, this precondition is not sufficient. The theory of historical materialism does not explain the transition from socialism to communism. In other words, upon the achievement of socialism, it becomes historically possible to stay there or to move to communism, the point being that the distributive practice of communism does not seem to be required by (explained by) the development of the forces of production. "That transition is explained in terms of the superiority of communism as an ideal of distributive justice" (Moore 1980, 36). "The argument from historical materialism proves at most that classless economies will develop to a point where men can choose between socialism and communism. The prediction that they will choose communism rests wholly upon the argument from distributive justice" (Moore 1980, 45). It turns out, then, that Marx's ideal theory functions both negatively as critique of precommunist societies and positively as recommendation encouraging the move to the good social life, an association that ensures an equal distribution of welfare, which is to say the full development of the inequality among individuals, of the inequality of their capacities, desires, and personalities. Communist justice establishes the equal right to personal inequality in a setting of social equality. This equal right, respectful of persons qua persons, transcends bourgeois right, which safeguards those whose interests can be realized only at the expense of others. This "higher right," which Moore traces to the influence of Hegel's *Philosophy of Right*, corresponds to the ideal justice of Marx's communist

society. Whether Moore is correct in his genealogy is an issue I take up in the following speculative remarks.

Marx correctly says, in *Critique of the Gotha Programme*, that every right, in its content, is a right of inequality. He is confused, however, in claiming that every right suffers from the defect of treating each individual in one particular aspect only, for example, basing distributive rights on the equal standard of labor contribution. Marx's general rule for communist distribution, after all, accords to all the "higher right" to equal welfare and thus considers recipients in all the unequal aspects that define their particularity. Communist right does not discriminate according to "one-sided" criteria, à la bourgeois *recht*, but transcends that narrow horizon with a distributive principle making possible for each person an all-sided individuality that finds realization in both the spheres of production and consumption. In other words, Marx's communism does not consist in an identity of interests or homogeneity among some amorous communal assemblage with the unity of man with man as its basis, but rather

a community [within which] people may still express themselves in different ways and have different interests. Marx's point is that these interests will be harmoniously related and united. They may be different as the notes of a musical chord, and yet still fit together to form a coherent, harmonious, meaningful whole. The unity or harmony of interests will then preserve the particularity of the individual parts: "The unity of man with man" . . . is based on the real differences of men (Brenkert 1979, 121).²³

The concept of communist right, therefore, does not entail prejudice against the welfare of individuals with different abilities, wants, or plans of life. To whom are we to trace this conceptually coherent and pluralistic idea of right?

It would be a mistake, following Moore (1980), to attribute unqualifiedly Marx's "higher right" to Hegel. First, Hegel's superior right embodies not only general rules (which is fine) but also patterns of solidarity that characterize *communities*. But we have good reason to believe that Marx's communism is anything but a community, especially if the latter possesses the sense given to it by contemporary communitarian theorists such as Sandel (1982), MacIntyre (1981), and Taylor (1979). There is little in Marx suggesting that in communism the *identity of persons* is constituted by parochial, national, neighborhood, or family attachments, and there is everything that suggests Marx's

²³ Kymlicka (1989, 126) writes: "I think the Kantian strain in Marx is a more promising starting point [than the strong, Aristotelian perfectionist one]. According to this premiss, individuals should be free to decide for themselves what is worth doing with their lives, within a community that is transparently intelligible, and that treats each individual as an equal. But of course that is the premise that liberals start out from as well." Kymlicka does ascribe to Marx, I think correctly, a weak kind of perfectionist ethics that is compatible with pluralism, what I call thin perfectionism and what Rawls (1971, 326) calls "perfectionism [of an] intuitionistic form," which he dubs a reasonable view and one not inconsistent with liberal justice. This kind of justice incorporates an equality principle along with a principle of perfection and so differs from the perfectionism of antiliberal thinkers such as Aristotle, Nietzsche, Leo Strauss, and their epigones. See Kymlicka 1989, 35, and Freeman 1994, 341-2.

antipathy to the communitarian *way of life*, complete with its patriotic rituals, conformist morality, and structured attachments. Might it be that, as Lukes (1985, 93) wonders, the unity of Marx's communism is no more than the "unity of freely associating sovereign choosers," "free of extraneous purposes, natural necessities, and social duties," "combining to attain the full development of human mastery over the forces of nature . . . as well as humanity's own nature?"²⁴ Lukes is not sure, but Cohen is. For Cohen (1978, 133), Marx's communism not only is not a community but also is an alternative to society. Communism abolishes roles and the mediation of institutions, leaving individuals to face one another and themselves "as such," freed from the ossified social activity that stands as an objective, alienating power above them.²⁵

Second, Hegel is the wrong place to go when justifying an interpretation (which Moore accepts) of Marx as ideal theorist, as one who has an ideal theory of justice that functions to assess precommunist societies. Wood (1981, 132) has an Hegelian reading of Marx: "For Marx, as for Hegel, the morally rational is determined by the socially actual," which is to say that Marx is interested only in the sociology of morals, not in any first-order moralizing. This is the view that Marx considers slavery, feudalism, and capitalism to be just according to their own standards (which are the only relevant ones), that Marx has no "properly" moral theory, and so on. It is Wood's view, as Ryan (1987, 119–20) puts it in a more recent espousal, that "Marx followed Hegel in disbelieving in the existence of the realm of the *ought* which stood opposed to the *is*." Intimately related to this slant on Marx, and partially responsible for it, is the idea that Marx has no moral agenda because of a distinction thought to exist between moral and nonmoral goods, the former including things such as right, justice, and duty, the latter including items such as pleasure, self-realization, and happiness. In short (and in line with a familiar distinction in moral philosophy), it is said that Marx puts the nonmoral good before the moral right and that his sole aim is the maximization of the former in communist society (Wood 1981, chapter 9).

But if the argument I have set out possesses the plausibility I have awarded it, then this cannot be right. This is because Marx attacks precommunist societies, including socialism, as ethically exploitative independently of whether they foster the development of the forces of production or maximize the nonmoral good. His criticism of socialism is especially telling because this is one of the few occasions on which he speaks plainly about a defect in a distributive principle, and the context makes it clear that he is speaking of a moral

defect. Do not moral concerns about distribution imply an interest in justice? Marx's condemnation expresses a moral indignation at institutions that permit and pressure individuals to treat one another systematically not as ends but means, his language implying a sense of justice that has more in common with Kant than Hegel. This is not to say that Marx is unconcerned with maximizing nonmoral goods, such as freedom and self-realization, along with their material and cultural bases, but it is to say that he is interested in their radically egalitarian distribution.²⁶ Peffer identifies Marx's moral theory as "mixed deontologist," as one

that considers the production of the (specified) moral goods as a relevant consideration but holds, nonetheless, that the right action may not be the one that maximizes the nonmoral good. The production of the nonmoral good may be constrained, for example, by the principles of its distribution or by other principles of right that are not themselves validated on the basis of their production or maximization of the nonmoral good. John Rawls and William Frankena are examples of contemporary moral philosophers holding mixed deontological theories (Peffer 1990, 84).

Three caveats are in order. First, to call attention to Kant-Marx affinities does not entail that Marx buys into the transcendental element of Kantian ethics any more, say, than Rawls does in his Kantian interpretation of justice as fairness. The ethical principle of equal concern and respect for persons is what Rawls gets from Kant, and these are persons subject to the general conditions of human life, not ontologically "noumenal" nor "pure intelligences not subject to [the restraints and circumstances of social existence]" (Rawls 1971, 257).²⁷ Second, the Rawlsian version of the principle accords a primacy to the social, in contrast to Kant's application to the personal maxims of conscientious individuals in everyday life (Rawls 1980, 552). Marx similarly distanced himself from Kant on this score, albeit more polemically ([1844] 1964, 207–10). Third, Rawls no more than Marx accepts the radical anticonsequentialism of standard interpretations of Kant according to which the principle of treating persons as ends in themselves cannot be used to sacrifice rights and liberty in the name of promoting conditions necessary to bring about the Kingdom of Ends.²⁸

²⁶ "The idea of treating people as equals is fundamental to Marx. It often appears in Marx in the same form that it appears in Kant, i.e., that we should treat people as ends not means. This requirement underlies both his critique of capitalism and his defence of communism" (Kymlicka 1989, 107). For more on Kantian themes in Marx, see Peffer 1990, 118–23.

²⁷ And see Rawls 1993, 27, where he clarifies the mistakes of Sandel.

²⁸ For heterodox interpretations, see Cumiskey 1990 and especially Korsgaard 1986. Korsgaard distinguishes between ideal and nonideal theory and explains the role of the latter in Kant's ethics. The basic idea is that nonideal theory applies under nonideal conditions—those that prevent realization of the ideal principles which prevail in the Kingdom of Ends—and requires conduct that can be realistically expected to further conditions in which realization is feasible. This should not be confused with consequentialism. "In a non-ideal case, one's actions may be guided by a more instrumental style of reasoning than in ideal theory. But non-ideal theory is not a form of consequentialism. There are two reasons for this. One is that the goal set by the ideal is not just one of good consequences, but of a just

²⁴ Also see Luke's (1967) fine piece in which he sets the communitarian views of Durkheim against those of the "anti-social" Marx. Yack (1986, 292), like Lukes, understands that "the unstated premiss of Marx's argument . . . is that man possesses the negative capacity to resist identification with any particular external condition, the capacity that Kant and Hegel use to define man's humanity and special dignity."

²⁵ The relevant passages are in Marx and Engels ([1846] 1964, 86–95).

I cannot *prove* the conjuncture between Marx and Kant on the topic of exploitation and justice as discussed here. As almost everyone who has written on Marxian justice and morality stresses, Marx's refusal to engage in systematic talk about this topic allows for different readings. Exegesis provides no controlling evidence. It is a matter of plausibility, not proof, that as the Kantian socialists argued at the turn of the century, "there is a Kantian dimension to [Marx's] work" (Van Der Linden 1988, 64) as well as the obvious Hegelian one, leaving open the question of whether or how these dimensions can ever be reconciled. But it suffices here if I have advanced the view that Marx has a general theory of exploitation—logically independent of value, labor, and class—derived from a model of a perfectly just society in which everyone, by virtue of personhood, is deserving of equal welfare.²⁹ Those societies which deny this by permitting morally arbitrary factors to determine distributive shares stand condemned as exploitative and unjust.

state of affairs. If a consequentialist view is one that defines right action entirely in terms of good consequences . . . then non-ideal theory is non-consequentialist. The second reason is that the ideal will also guide our choice among non-ideal alternatives, importing criteria for this choice other than effectiveness" (Korsgaard 1986, 343n).

²⁹Galston (1991, 131–2) writes: "There is nothing self-contradictory about basing a [desert] claim on some undeserved feature of yourself . . . [e.g., if] moral personality is the basis of your claim to be taken into consideration." He goes on to say that Rawls "establishes as the sole, relevant desert basis a feature of our lives (moral personality) that equally characterizes nearly all of us." The problem is that Rawls's second principle justifies an unequal distribution of economic and social goods, and this has generated the criticism that Rawls fails to accommodate properly the practice of desert, substituting for it that of "entitlements" for which individuals seem to be undeserving. This is not the place to elaborate on this complex issue, except to say, with Cohen (1989), that Rawls relies on entitlements only because he thinks that the idea of rewarding desert is impracticable, that is, because of the extreme difficulty in arranging distributive institutions which systematically separate morally arbitrary considerations from those involving free choice and self-determined effort and responsibility. And this separation needs to be done in cases of expensive preferences in the face of scarcity. Marx, given his rosy assumption of abundance in communism, does not even begin to address this problem, but contemporary egalitarian theorists have worked up the outlines of hypothetical distributive schemes that might sort out the morally relevant from the morally arbitrary. See, for example, Roemer 1993 and Van Parijs 1995; also interesting is Miller's (1996) treatment of market distribution and moral desert.

Political Liberalism, Deliberative Democracy, and the Public Sphere

EVAN CHARNEY *Harvard University*

Theorists of democracy emphasize the importance of a public sphere, distinct from the apparatus of the state, where citizens can freely associate, deliberate, and engage in collective will formation. Discourse ethicists and deliberative democrats locate the public sphere within civil society and the manifold associations that comprise it. For Seyla Benhabib, the public sphere is constituted by the anonymous "public conversation" of civil society. By contrast, John Rawls has a much more limited conception of the public sphere. For Rawls, public reason, which establishes norms for democratic discourse, applies to a limited domain. I defend Rawls's view against the charge that it depends upon an untenable distinction between the public and nonpublic spheres. I argue that Rawls's more limited "liberal" conception better guarantees the heterogeneity of associational life in civil society. I then argue that Rawls violates his own principles by partially collapsing the public-nonpublic distinction with potentially illiberal consequences.

The recovery of the public realm" might be an appropriate way to characterize a recent trend in democratic political theory. Democratic theorists, in the tradition of Tocqueville, now emphasize the importance of voluntary associations in civil society for the generation of "social capital," that is, the various norms associated with the democratic art of collective self-rule and decision making (Putnam 1995). Deliberative democrats and discourse theorists emphasize, in the Arendtian tradition, the importance of a free public sphere, separate from the apparatus of the state and economy, where citizens can freely debate, deliberate, and engage in collective democratic will formation. Jürgen Habermas and various deliberative democrats emphasize the importance of both an Arendtian public sphere and associations in civil society. These theorists locate the public sphere not in a common public space, as in the Greek polis, or in a Rousseauian general assembly attended by all citizens, both of which are seen as untenable alternatives under conditions of modernity. They locate it within civil society itself, that is, within all the manifold forms of associational life that comprise civil society in the modern democratic state. According to Seyla Benhabib (1996, 73–4), the reason a deliberative model of democracy can dispense with the fiction of a mass assembly is that it locates the public sphere in a plurality of modes of association within civil society: "It is through the interlocking net of these multiple forms of associations, networks and organizations that an anonymous 'public conversation' results." Benhabib (p. 75) contrasts this model with the "liberal model" of John Rawls, for whom the public sphere is located not within associational life in civil society but, rather, within a more restricted sphere, including first and foremost the legal sphere and its institutions.

In this article I shall argue for just such a limited liberal conception of the public sphere as presented in the work of Rawls. This more limited conception actually better serves to guarantee the autonomy of associational life within civil society and its independence from the coercive powers of the state (or, for

that matter, from the "coercive power" of normative political theory). My purpose is in no way to question the significance of associational life either for the process of democratic will formation or for its role in instilling the various norms associated with democratic citizenship, that is, its value as social capital. Rather, it is to argue for the value of a principled liberal distinction between the public and the private.

What I have in mind here by preserving the public-private distinction is not the Arendtian concern that the rise of the social has effaced the distinction between the public and private and hence the dividing line between the realms of "necessity" and "freedom," reducing political life to a form of "household administration" (Arendt 1957, 33–49). Nor is it the related Habermasian concern that the space of democratic decision making has now been "colonized" by technical administrative imperatives (Habermas 1985, 1989). These are legitimate concerns. What I mean by the private sphere is simply the familiar liberal concept of a realm of thought and action that is protected from the coercive power of the state and that involves the concepts of limited government, liberty of conscience, and the separation of church and state. In the "Liberalism of Fear," Judith Shklar (1989) identified the maintenance of just such a public-private distinction as a kind of shibboleth for identifying a "true" form of liberalism:

[Liberalism] must reject only those political doctrines that do not recognize any difference between the spheres of the personal and the public. Because of the primacy of toleration as the irreducible limit on public agents, liberals must always draw such a line. This is not historically a permanent or unalterable boundary, but it does require that every public policy be considered with this separation in mind and consciously defended as meeting its most severe current standard. The important point for liberalism is not so much where the line is drawn, as that it be drawn, and that it must under no circumstance be ignored or forgotten (Shklar 1989, 24).

I shall argue that, although this is certainly not their intent, some discourse ethicists and deliberative democrats are in danger of collapsing this distinction with potentially illiberal consequences. And I shall argue that Rawls himself ultimately violates his own founda-

Evan Charney is a Ph.D. candidate, Department of Government, Harvard University, Cambridge, MA 02138.

tional principles by partially collapsing this distinction with the same consequences.

POLITICAL LIBERALISM AND PUBLIC REASON

In *Political Liberalism* (1993, xvi–xviii), Rawls asks how persons in a democratic society whose political culture is characterized by a diversity of opposing and irreconcilable religious, philosophical, and moral doctrines can freely endorse a common political regime. In other words, what is the basis of political legitimacy in a pluralistic society? For Rawls, the answer depends upon articulating a conception of justice that can be endorsed by the various “reasonable” comprehensive views in society, that is, one that can be the focus of an overlapping consensus despite profound disagreement on other matters of “ultimate concern.” To uncover such a consensus, the conception of justice to regulate society, and the political society regulated by that conception, “should be as far as possible, independent of the opposing and conflicting religious and philosophical doctrines that citizens affirm” (p. 9). Among such conflicting doctrines, Rawls now includes the liberalisms of Kant and Mill, as well as his own *A Theory of Justice* (1971), seen as fostering certain values (i.e., individuality and autonomy) meant to govern much if not all of life (Rawls 1993, xvi–xvii, 98–100). In a society characterized by value pluralism, the values of individuality and autonomy as regulative ideals for all of life will not be, and should not be expected to be, an ideal for all citizens. According to Rawls (p. 13), what distinguishes political liberalism from such “comprehensive” liberalisms as those of Kant and Mill, as well as all other comprehensive views, is its limited scope. It applies to a limited public domain—that of persons as citizens—and the values and virtues it invokes are meant to apply to persons in their capacities as citizens, that is, to be “political” as opposed to “ethical” virtues and to be justified on the basis of certain qualities of character necessary for citizens in a democratic regime (p. 195).

All these distinctions, namely, that between a common public political conception of justice and various comprehensive views within society, between “political” and “ethical” virtues, between persons qua citizens and persons qua persons, between political values and other values that apply to “all of life,” and between the modes of reason appropriate to the public sphere (i.e., public reason) and those appropriate to other “spheres,” depend ultimately upon one fundamental distinction—that between the public and private. Yet, Rawls (1993, 220) specifically states: “The public vs. nonpublic distinction is not the distinction between public and private.” He avoids the locution of a public-private distinction because of the individualistic non-associational connotations of the word “private,” maintaining that “there is no such thing as private reason” (p. 220). The word *nonpublic* is employed by Rawls most often to denote various forms of associational life within society—what in *A Theory of Justice* are called “social unions.” These include the family as well as all

kinds of voluntary associations in civil society, such as clubs, churches, and universities (Rawls 1971, 520–9).

Paralleling this distinction, Rawls makes a fundamental distinction between public and nonpublic “uses of reason.” The nonpublic uses include the “social,” the “familial,” and the “individual” (Rawls 1993, 220). Most often by the term “nonpublic reason” Rawls intends the social uses of reason, and it is in this sense that I shall employ the term throughout. These nonpublic reasons are simply the various forms of reasoning, whatever they may be, that characterize associations within civil society. It is, for example, the reasoning of “churches and universities, scientific societies and professional groups. . . . Nonpublic reasons comprise the many reasons of civil society and belong to what I have called the background culture in contrast with the public political culture” (p. 220). By contrast, public reason is a normative ideal, meant to apply in particular to the judiciary and a supreme court—called the “exemplar” of public reason; to political officials when they “speak in official forums”; to the executive in its public acts and pronouncements; to members of political parties and candidates in their campaigns; as well as to citizens when they “engage in political advocacy in the public forum” and vote on issues concerning “constitutional essentials and matters of basic justice” (pp. 215–6).

In brief, public reason limits, in the specific venues and circumstances noted above, the reasons invoked in a process of justification or argumentation to those that appeal to political values or the values of a “political conception of justice,” which conception itself involves a conception of society as a fair system of cooperation among free and equal citizens possessed of certain basic rights and liberties and entitled to certain basic opportunities (Rawls 1993, 15–6, 223). The same criteria that determine what can count as legitimate reasons for the selection of principles of justice also ideally determine what can be advanced as legitimate reasons in the public sphere: “In justice as fairness, then, the guidelines of public reason and the principles of justice have essentially the same grounds” (pp. 225–6). Because of a presumed divergence of moral and religious interests, the limitations imposed by the veil of ignorance preclude the parties in the original position from giving as a reason for the selection of a principle of justice that, for example, it is prescribed in the Decalogue (Rawls 1971, 14, 127, 327). Similarly, public reason in its strictest form precludes appeals to particular comprehensive moral, religious, or philosophical doctrines in the public sphere (Rawls 1993, 10, 214–8).¹

¹ Rawls (1996) revised his view somewhat in Section 5 of the Introduction to the paperback edition of *Political Liberalism*. There he says that reasonable comprehensive doctrines “may be introduced into public reason at any time, provided that in due course public reasons, given by a reasonable political conception are presented sufficient to support whatever the comprehensive doctrines are introduced to support” (p. lii). There are many problems with this formulation. By allowing only reasonable comprehensive views into public reason, Rawls adds very little to his original formulation, inasmuch as reasonable comprehensive views are defined as those

In addition to limitations on content, public reason incorporates certain limits on method. These involve an adherence to general principles of reasoning, criteria of relevance, and rules of evidence—"accepted general beliefs and forms of reasoning found in common sense, and the methods and conclusions of science when these are not controversial" (Rawls 1993, 224–5). As with the restriction upon reasons, the restrictions on method are meant to provide a public basis of justification accessible to citizens generally: For example, revelation would be "ruled out of court" (literally and figuratively) as a rule of evidence. Thus, public reason seeks to create a common ground of public-political justification, which by limiting itself to the values of the political and ways of reasoning available to citizens generally can provide an acceptable basis of legitimation for citizens in a pluralist society. As such, public reason is a form of what Gutmann and Thompson (1996, 55) have characterized as a principle of "deliberative reciprocity": "When citizens deliberate, they seek agreement on substantive principles that can be justified on the basis of mutually acceptable reasons."

CONTESTING THE LIMITED PUBLIC DOMAIN

Distinguishing the Domains

The first objection I shall consider is that public reason, by attempting to limit the justification for legislation to an appeal to political values, relies upon a rigid *a priori* division between the public and private, one in which the public is defined as that domain of actions seen as appropriately regulated by principles of justice and the coercive power of law. According to Habermas (1995, 129), such an *a priori* boundary conflicts with historical experience and with "the fact that the historically shifting boundary between the public and private spheres has always been problematic from a moral point of view." Similarly, Benhabib (1992, 99–100) maintains that "democratic politics challenges, redefines and renegotiates the divisions between the good and the just, the moral and the legal, the private and the public." She argues that practices once considered to be part of the private domain, such as certain aspects of worker-employee relations, are now seen as "public," in the sense of being viewed as matters of political justice and as appropriately regulated by law. Conversely (although Benhabib does not make this point), some matters once viewed as public in the sense of being regulated by law are now seen as part of the private domain (e.g., contraception).

Yet, the concept of public reason is in no way inconsistent with the fact that matters once considered

part of the private domain have come to be seen as appropriately regulated by law and, hence, to that extent public, or that matters once considered to be appropriately regulated by law are now viewed as part of the private domain. When matters once viewed as "private" come to be seen as proper objects of legislation, such legislation is itself generally justified in terms of public-political values. For example, the repudiation of laissez-faire economics, upheld by the Supreme Court in *Lochner v. New York* (1905), entailed a shift in the view of which practices could be appropriately regulated by law and thus entailed a corresponding shift in the view of the boundary separating the public and private domains.² The justification for the subsequent legal regulation of such practices, however, has been presented in terms of the promotion of the political values of regulating the health, safety, and economic well-being of the general public, and in this way such regulations have been justified in a manner consistent with the limitations of public reason.

Does the acknowledgment of a potentially shifting boundary between the public and private domains entail, then, that everything is potentially subject to public determination and legal regulation, as long as a justification for such regulation is presented in terms of public reasons?³ The answer is "no," for a reason related to the concept of public reason itself: The limitations of public reason are in part a reflection of the *limited ends of government*. As noted above, for Rawls the principles of justice and the principles of public reason have the same grounds. Since it is assumed that persons have diverse comprehensive (e.g., religious) beliefs that they seek to advance, one proper role of government is seen as upholding the liberty to exercise such beliefs. In this way, the free exercise of religion remains a "private" right of individuals (although it is a right most often exercised by individuals as members of various groups). Any attempt to regulate this "region" of the private domain—that concerned with religious belief and practice—would entail simultaneously a violation of public reason and a violation of the basic principles of the liberal democratic state, for it would constitute a violation of the principles of the separation of church and state and liberty of conscience. This does not mean, of course, that such practices cannot be regulated if they are deemed to endanger the health and safety of members of the community or violate their rights as citizens: Churches can excommunicate heretics but not burn them at the stake. But the justification for such regulation must itself be presented in terms of

which will support the proper balance of political values and which do not "run afoul" of public reason (1993, 243–4). Only "reasonable" comprehensive views are allowed into public debate, but before any debate has occurred, before the "reasonable" balance of political values has been determined, how do we know which comprehensive views are reasonable concerning a given issue? For more on this point and the problem with the definition of a "reasonable" comprehensive doctrine, see my discussion below.

² The shift to which I refer is not the regulation of liberty of contract, since private contracts have always been "public" to the extent that such contracts have been upheld by law. (Similarly, the "free market" is not a "private market," to the extent that market transactions are upheld by the coercive power of law and the state.) I refer to the regulation of practices once genuinely unregulated and hence "non-public," such as workers' wages and workplace safety, which subsequently came to be legally regulated "public" concerns.

³ I am indebted to an anonymous reviewer for raising the question of whether a strict conception of public reason is consistent with a belief that everything is in principle subject to public determination.

the limited, that is, political, ends of government.⁴ Thus, substantive limitations upon the proper ends of government determine both the limits of the public domain and the limitations imposed by public reason. Since public reason itself places a limit on what can be viewed as a public harm or a public good, it places a limit upon what can be a matter for legislation. Salvation is not a public good; damnation is not a public harm, since, in Lockean terms, "the Care of Souls is not committed to the Civil Magistrate" (Locke [1689] 1983, 26).⁵

This point leads to the following related objection. The distinction between the reasoning of associations within civil society and the public domain subject to the limitations of public reason is an untenable one, inasmuch as many civil associations are also public bodies—such as churches and universities—and therefore must comply with some of the same legal and constitutional restrictions to which other more obviously public (i.e., governmental) institutions are subject. As Benhabib (1996, 76) notes: "All clubs, associations and organizations within civil society have charters that can be subject to public as well as legal scrutiny." A country club that discriminates on the basis of race may have to change its charter if it seeks to become a legally incorporated entity. From this Benhabib concludes that "the constitutional-democratic state and the institutions of civil society are therefore not as sharply separable as some of Rawls's formulations suggest" (p. 76).

While it is certainly true that all such associations can be subject to legal regulation, one cornerstone of American constitutionalism, the so-called state action doctrine, depends upon the recognition of a fundamental distinction between the public and nonpublic spheres in this regard. Concerning the importance of maintaining this distinction, particularly in relation to voluntary associations in civil society, Justice Douglas wrote in his *dissenting* opinion in a case in which the granting of a liquor license to a "whites only" fraternal organization was found not to constitute state action:

My view of the First Amendment and the related guarantees of the Bill of Rights is that they create a zone of privacy which precludes government from interfering with private clubs or groups. The associational rights which our system honors permit all white, all black, all brown, and all yellow clubs to be formed. They also permit all Catholic, all Jewish, or all agnostic clubs to be established. Government may not tell a man or a woman who his or her associates must be. The individual can be as selective as he

desires. . . . The problem is different, however, where the public domain is concerned (*Moose Lodge No. 107 v. Iris* 1972, 179–80).

If a church or a university discriminates on the basis of race, then it can lose tax-exempt status, the granting of such status being seen as an instance of state action and hence as bringing such institutions into the public domain *to that extent* (*Bob Jones University v. United States* 1983). Of course, as Douglas's dissent in *Moose Lodge* indicates, the question as to what constitutes state action and hence the "public domain" is a highly contested and complex issue. Justice Rehnquist, who wrote for the majority in *Moose Lodge*, rightly noted in another case: "While the principle that private action is immune from the restrictions of the Fourteenth Amendment is well established and easily stated, the question whether particular conduct is 'private,' on the one hand, or 'state action,' on the other, frequently admits of no easy answer" (*Jackson v. Metropolitan Edison Co.* 1974, 349–50).

It is not my intention here to enter into a consideration of the complexities of the state action doctrine. Furthermore, as Cass Sunstein has noted, (1993, 160) the pertinent question is often not whether the state has acted at all—upholding a racially restrictive contract or evicting protesters from a mall seem unambiguous instances of state action—"but whether the state action *at issue in the relevant case* violates the pertinent provision of the Constitution," that is, violates the equal protection clause or any other constitutional provision. According to Sunstein, however, his claim that upholding laws of contract, tort, and property constitutes unambiguous instances of state action is "emphatically not that there is no line between public and private action, or that private action is constitutionally restricted," or that "everything is state action" (p. 159). My point here is not to emphasize that the boundaries dividing the public and nonpublic in regard to associational life are easily determined or uncontroversial; rather, what Shklar (1989, 24) said of liberalism in general applies in this case as well: What is of vital importance "is not so much where the line is drawn, as that it be drawn, and that it must under no circumstance be ignored or forgotten."

Public Reason and Civil Society

There is, of course, another way in which constitutional doctrine supports the public-nonpublic distinction in regard to associations within civil society, and these are the general provisions of liberty of conscience as embodied in the First Amendment. Thus, while liberty of conscience protects the individual from the church—persons may freely join and leave religious associations with no loss of civil liberties—it also protects the church from individuals, other associations, and the government. As Rawls (1993, 221) notes, "equally, liberty of conscience and other liberties such as freedom of association protect churches from the intrusions of government and from other powerful associations." And from its earliest formulations, the doctrine

⁴ For more on this point and its implications in regard to the establishment and free exercise clauses of the First Amendment, see my discussion below.

⁵ Stating this does not entail that it is illegitimate for the state to take measures to promote in citizens the various political virtues associated with democratic citizenship. As Rawls (1993, 195) notes: "If a constitutional regime takes certain steps to strengthen the virtues of toleration and mutual trust, say by discouraging various kinds of religious and racial discrimination (in ways consistent with liberty of conscience and freedom of speech), it does not thereby become a perfectionist state of the kind found in Plato and Aristotle, nor does it establish a particular religion as in the Catholic and Protestant states of the early modern period."

of the separation of church and state has been invoked as a way to protect the autonomy of churches, as well as individual liberty of conscience, from governmental intrusion.⁶

The doctrine of the separation of church and state means that churches and other religious associations have a protected domain of “nonpublic” reasoning subject neither to the coercive legal power of the state nor to anything like the limitations of public reason—construed as a normative ideal, not a legal requirement (Rawls 1993, 213, 220–2). Such a domain constitutes the “internal life” of religious associations. Members of a congregation will normally appeal to the “whole religious truth” as they see it in regard to most matters, and this includes political matters. Appeal is made to criteria of truth and rules of evidence specific to their faith, for example, to the divine nature of a text or a prophet or to divine revelation. Of course, religious beliefs and practices may be exposed to criticism by others within civil society; they may become part of a larger “public” debate. Such beliefs and practices may themselves be influenced by debate in civil society and respond to changing societal and cultural norms. In this regard, Benhabib (1992, 65) notes how the “private and public languages of morals intertwine, and how the conventional, religious private morality of individuals and sects gets infiltrated and influenced by the post conventional morality of the liberal democratic state.”

It is certainly not my intent to deny the reality of this process. The internal life of religious and other associations is rarely hermetically sealed from the outside world and the surrounding civil society (although some sects do strive to preserve their “traditional” ways and to insulate themselves as far as possible; see the well-known case *Wisconsin v. Yoder* 1972). Debates concerning, for example, the ordination of women, the marriage of priests, the doctrine of papal infallibility, and a host of other issues “religious” in nature can and do become topics of debate in civil society, involving interdenominational dialogue, the media, and the participation of any and all associations and individuals who feel that they have a stake in the matter. Here, too, nothing like the limitations of public reason are appropriate. Feminists—Catholic or not—may attack the doctrine of the Catholic church concerning the ordination of women by appealing to whatever principles they wish, and the church may respond, as it has responded, by appealing to its particular understanding of religious doctrine and a given religious tradition. Debates of this kind may be unabashedly partisan in the sense that appeal is appropriately made to sectarian religious principles which may not constitute acceptable reasons for others. In debates of this kind, however, what is at

issue does not concern law, that is, the use of the coercive power of the state. Churches are voluntary associations: Those dissatisfied with the policies of a given denomination are free to engage in public protest, leave the faith, join another denomination, or establish one of their own.

Even if public reason allows for flourishing debate in civil society, what if the debate does concern a matter for legal regulation? Are not many of the most bitterly contested issues in our society today precisely of this sort? Here it is important to stress the limited role of public reason. Rawls (1993, 215) says that in addition to particular venues associated with governmental power and governmental officials, public reason holds for citizens when they “vote in elections when constitutional essentials and matters of basic justice are at stake” and “when they engage in political advocacy in the public forum.” While he says that it holds for members of political parties and candidates and for groups who support them, is anything more implied by his description of the “public forum”? I think that in addition to such unambiguously political forums as the platforms of political parties, public reason can reasonably be applied in those venues where debate or advocacy occurs on matters of potential legislation concerning citizens in general *and the arguments—the reasons invoked—are intended to apply to any and all citizens*. Obviously, what I have just described would include some but not all media; it would not include religious television programs or religious newspapers or journals. But it would apply to members of any and all religious associations when, for example, they appear on the local news to advocate for or against legislation.

This may seem like an overly subtle and potentially illiberal application of the principle. Certainly, freedom of expression places no legal restrictions upon forms of argumentation in the media or any other public venue. Here it should be emphasized that the question is not one of law. Public reason is a self-imposed principle, a “duty” of civility and reciprocity, no more subject to legal enforcement than duties of politeness or etiquette. In Kantian terms, it is a duty associated with the doctrine of virtue, not the doctrine of right: “The system of the doctrine of duties is now divided into the system of the *doctrine of Right (ius)*, which deals with duties that can be given by external laws, and the system of the *doctrine of virtue (Ethica)*, which treats of duties that cannot be so given” (Kant [1797] 1991, 185). The difference is that, for Rawls, the duty of adhering to public reason is meant to involve a more limited political rather than an ethical virtue (both, however, are *moral* virtues—the political is a subset of the ethical/moral).

The problem with this, according to Thomas McCarthy (1994, 52), is that “political discussion would have to be radically transformed whenever the venue changed in relevant ways, even if the very same people were discussing the very same issues.” But, he continues, “can individuals reasonably be expected to divorce their private and public beliefs” in such a way as not to appeal to the whole truth as they see it? In contempo-

⁶ See, for example, the doctrine of “evangelical separation” associated primarily with Roger Williams, according to whom “worldly corruptions . . . might consume the churches if sturdy fences against the wilderness were not maintained” (Howe 1965, 6). Yet, Williams also thought it was possible for religions to accept a certain amount of state aid without state control, so his view has been characterized as one which saw the state as properly fostering a climate conducive to all religions and allowing for the existence of various forms of de facto establishment (Howe 1965, 11–2).

rary pluralistic democratic society, however, people do often tend to adhere to something like the limitations of public reason—or come to adhere to them—when engaging in political advocacy in the particular limited forums mentioned above. The reasons may be simple prudence, that is, a desire to win over a larger constituency, an obvious objective when one speaks in forums directed to the “public at large.” A politician in a religiously pluralist district, state, or country would be ill advised to argue in support of a given piece of legislation on the grounds that it is concordant with or supported by a particular religious doctrine, for the obvious reason that if her goal is to convince others to support the legislation, then she should offer to them reasons that they might reasonably be expected to accept. Furthermore, the offering of reasons specific to a particular religion could be construed as not respecting the religious differences of those of other faiths.⁷ And if her reasons are moral and not prudential, then she will be motivated by a principle of reciprocity to seek a common ground of reasoning with others, to offer reasons that constitute a common currency of debate in a pluralist society, that is, political reasons. For example, in the public arguments of religious opponents of abortion over time, a shift is noticeable away from particular religious appeals to arguments in terms of political values, that is, the “rights” of the fetus and the state’s interest in preserving life.⁸

While deliberative democrats have expressed concerns about what they see as the overly restrictive limitations of public reason, they often embrace principles of reciprocity that are almost indistinguishable. Consider, for example, Benhabib’s (1996, 71–2) description of what is involved in articulating a view “in public”:

The very procedure of articulating a view in public imposes a certain reflexivity on individual preferences and opinions. When presenting their point of view and position to others, individuals must support them by articulating good reasons in a public context to their co-deliberators. This process of articulating good reasons in public forces the individual to think of what would count as a good reason for all.

Note this description presumes that the reasons evoked must be reasons acceptable for “all,” where “all” seems to imply something like citizens generally, that is, citizens with potentially diverse comprehensive views

and not simply, for example, the members of one’s own church or synagogue or association within civil society. As to what will count as a good reason for all citizens in regard to political matters, it seems clear that principles specific to one’s comprehensive view will not be acceptable reasons to others holding different views, and the process of thinking of what would count as good reasons for all is in part, already, a process of adhering to the limitations of public reason. But in dialogue within a religious association, one would expect an appeal to shared principles specific to a given comprehensive view and not generally shareable by all citizens. What is being argued for here might be termed a conception of a limited public domain, appropriately subject to something like public reason or general principles of reciprocity, within a larger public domain composed of associations in civil society, appropriately not subject to such principles (so that it makes no difference whether one calls the internal life of such associations “nonpublic,” “private,” or another “region” of the “public” domain).

In fact, Benhabib (1993, 42–3) points to exactly this kind of distinction between the reasoning “internal” to a given association and that which governs dialogue with citizens at large in the context of political debate. She considers the case of a Mormon traditionalist, convinced of the moral correctness of the practice of polygamy on the basis of “the dictates of the teaching of Joseph Smith.” She then asks if such a Mormon could imagine a situation in which she had to justify to others who are not Mormons the morality of such a practice. The political parallel of this thought experiment concerns the recent example of those Mormons who have begun, as Benhabib phrases it, “to go public,” seeking legal protection for the practice of polygamy:

The fundamentalist Mormons have their private religious beliefs, but in the public arena of the liberal democratic state, they are using the secular language of moral tolerance, and the recognition of the civil rights of dissenting groups and minorities—they wish to be accepted by the state as “practitioners of a different lifestyle,” accepting thereby the legitimate plurality of lifestyles in the liberal state (Benhabib 1992, 65).

Here a distinction is drawn between the “public arena” and the “private religious beliefs” of Mormons. But as Benhabib undoubtedly would acknowledge, these private beliefs are in fact associational beliefs, just as the Mormons themselves are an association in civil society, the same civil society whose associations are said to be privileged by a deliberative model of democracy (Benhabib 1996, 73). Hence the public domain is here characterized in just the restricted Rawlsian sense for which I have been arguing. First, the debate on the legal status of polygamy concerns legislating on a matter of “constitutional essentials.” Second, the affected group is engaged in advocacy in the public domain by pressing its case in terms of political values and political principles, that is, *it is addressing its case to citizens at large*. But one would not expect the Mormons to apply the same principles or to argue in the same terms within their associations. There one might expect them to invoke the religious authority of Joseph Smith

⁷ The religious appeals of some abolitionists are often cited in discussions about the limitations of public reason (Galston 1991, 115; Holmes 1988; Sandel 1994). First, the value being evoked—the basic equality of all persons—was a political value, not only embodied in the Declaration of Independence and the Constitution but also a central component of political debate from the time of the pre-Socratics onward. The abolitionists were appealing to religious beliefs to support a known political concept. Second, the idea of the equality of persons could hardly be said to be specific to a given faith in the way that, for example, the idea of the Trinity is.

⁸ See, for example, the reasons invoked by Cardinal Bernadin (1986) in an article in which he argues against a right to abortion. His argument is presented in terms of the political values of public peace, the preservation of human rights, and accepted standards of moral behavior in a community of law. Rawls (1996, lvi) cites this article as an example of an argument against abortion that does adhere to the principles of public reason.

and his interpretations of the Bible. In such a venue, invocations of that kind are *reasonable* and satisfy a principle of reciprocity *within* a given association. This is precisely Rawls's (1993, 220) point in stating that the reason of associations in civil society "is public with respect to their members, but nonpublic with respect to political society and to citizens generally."

The Significance of a Limited Public Sphere

Deliberative democrats who privilege associations within civil society may well reject any distinction between the "internal life" of associations within civil society and associations viewed as participants in a wider public political debate addressed to all citizens. In this regard, Benhabib (1996, 76) maintains: "To say that when in civil society these individuals and associations are governed by one kind of reason, a nonpublic one, but that they have to respect the limits of public reason once they enter the political arena is inadequate, *for civil society is also public.*" I have already noted how Benhabib herself appears to draw just such a distinction. What I would like to consider here are the dangers of failing to draw it.

Consider, for example, some of the general principles of discourse ethics as laid out by Habermas (1990, 86), what he terms the "universal and necessary communicative presuppositions of argumentative speech." These require that every subject with the competence to speak and act be allowed to take part in the discourse; everyone is allowed to question any assertion whatever, to introduce any assertion into the discourse, and to express his attitudes, desires, and needs (p. 89). According to Benhabib (1996, 78), "the deliberative model of democracy presupposes a discourse theory of ethics," which incorporates two basic elements of Habermas's "ideal speech situation": All are "equally entitled to take part in those discourses which are to determine the norms that are to affect their lives"; and "each individual has the same symmetrical rights to various speech acts, to initiate new topics, to ask for reflection about the presuppositions of the conversation, and so on." These Benhabib terms, respectively, principles of universal moral respect and egalitarian reciprocity. As has been noted, for Benhabib (1996, 80) the "public sphere is introduced as the embodiment of discursive democracy in practice," where the public sphere is defined as being composed of all the manifold associations within civil society.

If we consider some of the general principles listed by Benhabib as underlying the validity claims of a deliberative model of democracy—participation governed by norms of equality and symmetry, equal rights to interrogate and question topics of conversation, no *prima facie* rules restricting the identity of the participants or the agenda—then it is clear that many of the most important associations comprising civil society do not come close to fulfilling these requirements. First, associations within civil society often have a highly selective membership, a point Benhabib (1996, 76) herself acknowledges: "Civil society and its associations are not public in the sense of always allowing universal

access to all." Second, many of these associations have "hierarchical" or "authoritarian" structures of discourse that do not meet such deliberative ideals as absolute symmetry and equal opportunity to initiate discourse and problematize matters. In regard to the concept of the public sphere as an embodiment of Arendtian freedom, Dana Villa (1992, 713) has remarked: "Not only coercion and violence, but all relations of hierarchy are excluded from this sphere." Yet, the modes of discourse or conversation in a church or synagogue, for example, often involve deference to the judgment and authority of individuals occupying certain roles, such as a priest or a rabbi. Some matters are often steadfastly denied a problematical status among participants in the "conversation," for example, whether a text is the word of God or whether God exists (although, of course, these matters also may come to be seen as problematical).

Third, and perhaps most significantly, according to Benhabib (1992, 42–3), discourse ethics presupposes a "postconventionalist moral system" characterized by a "moral reflexivity"—the ability to question radically all procedures of justification, including its own, and the requirement that the validity of normative practices be demonstrated with reasons that others who are not members of one's way of life can accept or find convincing. As such, moral postconventionalism is distinguished from moral conventionalism, based neither upon the ability to offer reasons acceptable to all nor upon the radical questioning of its own justificatory procedures. For Benhabib (p. 43), moral reflexivity and moral conventionalism are not compatible, although the rights associated with communicative ethics in a deliberative democracy would certainly not interfere with the practices of such "conventional" associations (to the extent that they do not infringe upon the rights and liberties of others). But the problem here concerns locating the "moral conversation" of a deliberative democracy within civil society, which presumably means *within* as well as *between* civil associations, when civil society is itself composed of numerous associations that practice "conventional" morality. To the extent that discourse ethics privileges voluntary associations in civil society, should such associations be expected to live up to a "postconventional" ideal of discourse ethics, and should they be judged by its standards?

Perhaps only certain associations are meant to be members of the "anonymous public conversation"—those which in some ways meet the demands of a discourse ethics. Benhabib (1996, 73) says that the procedural specifications of the model of discourse ethics "privilege a plurality of modes of association in which all affected can have the right to articulate their point of view." There is some ambiguity in this specification. Does it mean that only those associations are "privileged" in civil society "in which all affected can have the right to articulate their point of view"? The associations listed as being privileged by the discourse model are said to "range from political parties, to citizens' initiatives, to social movements, to voluntary associations, to consciousness raising groups and the

like" (p. 73). This does not appear to be selective, inasmuch as "voluntary associations" would include *all* associations in civil society (with the exception of the family).

In raising the question of the propriety of applying a postconventional ideal of discourse ethics to associations in civil society, we confront a paradox. The principles of discourse ethics, as analogously is Rawls's device of an original position, are principles of *universalization*. And according to Benhabib (1992, 42), the problem with the adherent of conventional morality is that "the kinds of grounds such a person will bring into the moral conversation will not be sufficiently universalizable from the standpoint of all involved." While not excluded from the moral conversation, such persons face a "rationality deficit"; there is a point in the conversation beyond which they cannot proceed: "Because the adherents of such moralities are willing to stop the conversation and because they have to withdraw from the process of reflexive justification in order not to let their world view crumble, their position is not comprehensive and reflexive enough" (Benhabib 1992, 43). To attain sufficient reflexivity, then, means a transformation from conventional to postconventional morality. And this in turn means argumentation from universalizable grounds, which presumably means *believing* in reasons based upon universalizable grounds and generalizable interests (assuming general principles are not presented hypocritically or for prudential reasons). The implications of this are, arguably, either the end of associations in civil society or their melding into one association à la Rousseau's ([1762] 1978, 109) General Assembly, in which "the more harmony there is in the assemblies, that is, the closer opinions come to obtaining unanimous support, the more dominant as well is the general will."

The reason for this, simply put, is that what is nonuniversalizable is the basis of difference, and discrete associations are founded upon a principle of difference. Neither the interest that unites bowlers nor the beliefs that unite Catholics are universalizable in a pluralist society. Churches are now viewed as associations within civil society rather than as part of the public domain, precisely because the beliefs and practices of particular religions are held to be nonuniversalizable in a pluralist society. If reciprocity is to "become the norm among humans as concrete selves and not just as juridical agents," in the strong "post-conventional" sense in which Benhabib (1992, 60) appears to intend the principle of reciprocity to apply, then all forms of conventional morality will become postconventional, and all reasons will ultimately be universalizable ones. In regard to pluralism and the public realm as a "discursive space," Villa (1992, 714) has remarked: "The public realm understood as a discursive space characterized by symmetry, nonhierarchy and reciprocity, both presupposes, and makes possible, plurality and so provides the opportunity for a politics based on mutual recognition and respect for difference." What I have argued is that the public realm, thus understood, *if located in the associations of*

civil society, does not respect difference and in fact endangers plurality.

The problem is not with a principle of universalization per se, for the limitations of public reason are also a form of such a principle, but with where it should be applied. The value of a more limited conception of the public domain is that it can acknowledge the validity—and perhaps even the value—of nonpublic associations based upon nonuniversalizable interests and modes of discourse. This very feature of nonuniversalizability, I have argued, is the impetus for the formation of discrete and varied associations to begin with. The ideal of public reason applies in those circumstances in which citizens are publicly addressed *as citizens* concerning political issues, not as church members or members of a particular association. Put another way, the "association" addressed by public reason is the association of political society as a whole, what Rawls (1971, 527) has termed "the social union of social unions." The process of adhering to the limitations of public reason in such circumstances is, I have argued, not a particularly unnatural or demanding process; it is the process cited by Benhabib whereby persons try to convince "others," such as those of a different faith, by appealing to reasons that can be convincing reasons for them, that is, for "all."

It may be objected that the argument thus far has displayed a good deal of sociological naiveté. If nonpublic life is not characterized in some ways by principles of egalitarian reciprocity, then how can we expect public life to be so characterized? Certainly, this is a matter of degree. We would expect a society in which all associational life, including personal relationships, is characterized by racial division to be race conscious and racially divided in public life as well. As I have noted above, the nonpublic realm changes in regard to changing societal norms and vice versa. From a sociological perspective, they are not at all completely distinct entities or domains. For the most part, associations of all kinds are "semipermeable" bodies within the larger democratic culture. At the same time, however, a good deal of associational self-selectivity, non-reflexivity, hierarchy, and deference to authority (of a religion, a text, a wise person, a teacher, a guru, God) is also compatible with democratic self-rule and adherence to principles of egalitarian reciprocity in public life.⁹ Put another way, public postconventional morality is compatible with considerable conventional morality in nonpublic associational life. In asserting this, I do not intend to extol the virtues of "conventional" morality, but it is my hope to avoid unnecessary criticism of such moralities as presently embodied in numerous and varied forms of associational life.

⁹ Recent work by Verba, Schlozman, and Brady (1995, 19) demonstrates how involvement in religious associations can promote the development of various "civic skills" associated with democratic citizenship: "organizational and communications skills that are relevant for politics and thus can facilitate political activity." The authors argue that these civic skills are "more or less fungible" and can be effectively transferred from the various "nonpublic" venues in which they are developed (in this case, religious associations) to public life, enhancing political participation (p. 520).

RAWLS'S ROUSSEAUISM AND THE COLLAPSE OF THE PUBLIC-NONPUBLIC DIVIDE

Although for Rawls public reason entails that citizens forgo arguing or reasoning on the basis of their comprehensive views in the limited circumstances defined as the public domain, this by no means entails that these very same views do not have a fundamental political role to play. As noted, the very views which are to give way in public life ideally guarantee the stability of the regime by forming the basis of an overlapping consensus. The political conception of justice is "a module, an essential constituent part that fits into and can be supported by the various reasonable comprehensive doctrines that endure in the society regulated by it" (Rawls 1993, 12). Thus, the political conception is in some way related to the broader moral and ethical values of citizens' comprehensive views and is thereby given a deeper or "ultimate" justification as part of what citizens view as the "whole truth." But given that citizens affirm a plurality of comprehensive views, the bases of deeper justification will themselves be plural: "It is left to citizens individually—as part of the liberty of conscience—to settle how they think the values of the political domain are related to other values in their comprehensive doctrine" (Rawls 1993, 140).

For Rawls, however, not just any comprehensive view can be a part of an overlapping consensus, only "reasonable" views: "We look for a consensus of reasonable (as opposed to unreasonable or irrational) comprehensive doctrines. The crucial fact is not the fact of pluralism as such, but of reasonable pluralism" (Rawls 1993, 144). It is the appropriateness of this division of comprehensive views into the reasonable and the unreasonable that I now want to question. Such a classification, I argue, is a problematical step in Rawls's theory and has the effect of ultimately collapsing the public-nonpublic distinction upon which his theory critically depends. To see why this is so, consider what exactly, according to Rawls, makes a comprehensive doctrine reasonable. He appears to offer two very different sets of criteria. The first concerns what might be called general features of coherence or rationality. Thus, a reasonable doctrine

covers the major religious, moral, and philosophical aspects of human life in a more or less consistent and coherent manner. It organizes and characterizes recognized values so that they are compatible with one another and express an intelligible view of the world. . . it normally belongs to, or draws upon, a tradition of thought and doctrine. Although stable over time, and not subject to sudden and unexplained changes, it tends to evolve slowly in the light of what from its point of view, it sees as good and sufficient reasons (Rawls 1993, 59).

The first question that may be raised is: How many religions (or for that matter philosophical) views actually fit this characterization of the reasonable? I would hazard that there never has been a religious or philosophical system without major inconsistencies, incoherences, and incompatibilities as well as a general clash of values on one level or another. Some religious doc-

trines emphasize faith over reason to such an extent that they codify, as an article of faith, a certain hostility toward rationality, such as Tertullian's *credo quia absurdum* (I believe because it is absurd) and Kierkegaard's "blind leap of faith." Furthermore, why are tradition and gradual evolution cited as features of the reasonable? The history of religion is punctuated by the relatively sudden appearance of new faiths: Lutheranism, for example, did not evolve gradually from Catholicism. Even in the case of science, which in some ways embodies the reasonable as an exercise of theoretical, as opposed to practical, reason, development has been punctuated by dramatic shifts in thought and doctrine, often not entirely explainable in terms of what has preceded (Kuhn 1962).

Second, and more significant, is the issue of whether a doctrine that seeks as far as possible to limit itself to the domain of the political and political values should pass judgment on what general structural features a comprehensive doctrine must have in order to count as reasonable and, hence, be part of an overlapping consensus. "Reasonable" here is not being used as a political or even moral concept, for its opposite is something like inconsistent or "irrational." Consider, for example, Rawls's (1993, 60) assertion that "in a particular case someone may, of course, affirm a reasonable doctrine in an unreasonable way, for example blindly or capriciously." Thus, Kierkegaard's blind leap of faith could be seen as an instance. Therefore, judgment is being passed from a nonpolitical perspective—a blind leap of faith endangers no one's rights—on the proper way to come to hold a religious belief, in direct violation of Rawls's insistence upon positing a domain of nonpublic reason that lies outside the purview of a strictly political conception. Such a breach in the public-nonpublic divide entails a corresponding violation of Rawls's (1993, 150) avowed hope "neither to assert nor deny, any particular religious, comprehensive, philosophical, or moral view, or its associated theory of truth and the status of values." Certainly, a belief as to how one comes to hold a true religious belief is an important component of any religion's theory of truth.

In addition to these general features, Rawls's (1993, 243) definition of a reasonable doctrine does have moral aspects: A doctrine is reasonable which can support a reasonable balance of political values. Before attempting to explicate this description, it must be noted that Rawls consistently talks about reasonable or unreasonable comprehensive doctrines as opposed to the reasonable or unreasonable *use* of a doctrine. He does characterize as unreasonable (p. 138) those who seek to enforce the doctrine *extra ecclesiam nulla salus* (beyond the church there is no salvation) as a political doctrine, in the sense of making conformity to the church in question required by law. He also asserts as vital to the idea of political liberalism that, while it may be unreasonable to use the power of the state to enforce a religious doctrine, this does not necessarily mean the doctrine is incorrect. This is all well and good, and consistent with the aims of political liberalism, but Rawls does not always adhere to this principle.

Rawls (1993, 152–3) considers the case of “rationalist believers” who seek to establish their particular religion on the grounds that it is a truth readily accessible to all through reason. To them, he says, “we need not say that their religious beliefs are not true, since to deny that religious beliefs can be publicly and fully established by reason is not to say that they are not true.” Yet, in the next sentence he asserts: “Of course, *we do not believe the doctrine believers here assert*, and this is shown in what we do. Even if we do not, say, hold some form of equal liberty of conscience, our actions nevertheless imply that *we believe the concern for salvation does not require anything incompatible with that liberty*” (p. 153, emphasis added). But does our unwillingness to consider enforcing the doctrine as law (or “establishing” it) really imply that we think the doctrine is false and, what is more, false *as theological doctrine*, that is, not required for salvation?

Rawls’s (1993, 152) claim that the falsity of a practice is implied by “what we do,” in the specific sense of how we adjudicate, has unfortunate consequences for political liberalism’s hope “to try to bypass religion and philosophy’s profoundest controversies.” It is important to note that there are two ways in which such controversies can be “bypassed” as a political matter. One is simply to remove from the political agenda altogether any issues which may give rise (or have given rise) to such controversies. This is rarely a viable alternative. How would one remove from the political agenda debates concerning abortion, capital punishment, doctor-assisted suicide, same-sex marriages, and a host of other issues with profoundly controversial philosophical and religious implications? The other way to bypass issues is a constraint upon reasons that can be invoked to justify public policies, or laws, or principles of justice, that is, by adhering to something like the principles of public reason.

For example, the establishment clause of the First Amendment is held to require that legislation be justified on the basis of legitimate secular (i.e., political) governmental interests (*Lemon v. Kurzman*, 1971). Simultaneously, the free exercise clause has long been held to bar from legal consideration the truth or falsity of religious doctrines or beliefs. This principle was given explicit statement in *United States v. Ballard* (1944), in which Justice Douglas’s majority opinion stated that the First Amendment barred submission to the jury of “the truth or verity of respondent’s religious doctrines or beliefs”; all that the jury could consider was whether the respondents believed the claims they made. Douglas commented in *Ballard* (pp. 86–7):

Men may believe what they cannot prove. They may not be put to the proof of their religious doctrines or beliefs. [The] miracles of the New Testament, the Divinity of Christ, life after death, the power of prayer are deep in the religious convictions of many. If one could be sent to jail because a jury in a hostile environment found these teachings false, little indeed would be left of religious freedom.

In free exercise cases, if a religion is adversely affected by legislation and a free exercise claim is denied, then the burden is justified in terms of the importance of

legitimate governmental interests, *not* in terms of the court’s passing judgment on the falsity of the religion in question. (See, e.g., *Jacobson v. Massachusetts* [1905], in which the compulsory vaccination of school-aged children of Christian Scientists was sustained against a free exercise challenge on the basis of the state’s compelling interest in protecting the health and safety of the community. As the Court noted in *Prince v. Massachusetts* [1943, 158], “the right to practice religion freely does not include liberty to expose the community . . . to communicable disease.”) Conversely, if religion is “advanced,” in the sense of removing a governmental burden seen as inhibiting its free exercise, the justification is presented in terms of the value of the free exercise of religion in general, not in terms of the truth of the particular religion in question. Thus, in *People v. Woody* (1964, 72), the court held unconstitutional the application of state criminal statutes to Navahos using peyote in religious ceremonies, on the grounds that “peyote . . . is the *sine qua non* of the defendants’ faith.” It did not say: “We have determined that the practice is pleasing to God.” In outlawing the use of peyote for all citizens in a general nondiscriminatory manner, the state was not passing judgment on the propriety of its use *as part of a religious ceremony*; in making an exception to this law, the state was not endorsing the practice from a theological perspective.

Michael Sandel (1994) appears to question the possibility of the kind of bypassing (or “bracketing”) here argued for, and he implies that adjudication affecting religious belief has in fact decided, albeit often surreptitiously, its truth or falsity. He writes in relation to abortion,

But whether it is reasonable to bracket for political purposes the moral and religious doctrines at stake depends on which of those doctrines is true. If the doctrine of the Catholic Church is true, if human life in the relevant moral sense does begin at conception, then bracketing the moral-theological question is far less reasonable than it would be on rival moral and religious assumptions. The more confident we are that fetuses are, in the relevant moral sense, different from babies, the more confident we can be in affirming a political conception of justice that sets aside the controversy about the moral status of fetuses (Sandel 1994, 1,778).

This formulation is based upon a misunderstanding. In regard to resolving the abortion issue, Rawls does not assert that the relevant moral status of fetuses should or can be bypassed or “set aside.” Rather, as far as possible, one should try to resolve the matter by public reason or in political terms (Rawls 1993, 243–4), which, as Rawls argues throughout, *are also moral terms*. The political is a domain of the moral, and a political conception of justice is also a moral conception (Rawls 1993, 13, 174–5). But how can one resolve such a question in political terms? Note that public reason includes common sense and the conclusions of science when not controversial. What does “common sense,” or a kind of basic empiricism that *excludes revelation*, tell us in this regard? It tells us that a fertilized egg cell up to a certain point appears and acts nothing like a distinct human being (in fact, before a

certain point it cannot be said to act at all). From this we may infer that it is not human in the relevant and limited political-moral sense, at any rate as far as preserving basic human rights go. This is undoubtedly crude. It is certainly not meant to be any kind of decisive argument (although it may be all that we can or should go on for political purposes).

Consider what it means to say that the resolution of the controversy depends upon showing that the *Catholic doctrine* is false (or true): "If the Catholic doctrine is right... it is not clear why the political values of toleration and women's equality... should prevail... It [the case for abortion] must engage rather than avoid the comprehensive moral and religious doctrines at stake" (Sandel 1994, 1,778). Catholic belief that status as a person begins at conception is an article of faith based upon a particular interpretation of the Bible (seen as a divine document), revelation, and theological doctrine. How are we to prove it wrong? Whether a fertilized egg cell or a fetus is a person is a normative question not amenable to anything like scientific refutation or verification (as opposed, e.g., to the heliocentric doctrine of the solar system, which the Catholic church initially opposed). To say that we must strive to "engage," that is, prove right or wrong, theological doctrine whenever adjudication touches upon theological matters would mean, for example, that we should determine from a theological perspective the propriety of the use of peyote as part of a religious ceremony. Yet, when Rawls asserts that our not believing the doctrine which rationalist believers assert "is shown in what we do," he seems to put in doubt the possibility of just this kind of "bypassing" and to threaten the constitutional divide between the public and private domains.

Rawls is not entirely consistent concerning whether our actions imply that we do believe such doctrines are false. But what seems textually unequivocal (or at any rate, less equivocal) is that such doctrines are classed as unreasonable. This can be seen by returning to Rawls's description of a reasonable doctrine. Rawls (1993, 243) asserts: "The only comprehensive doctrines that do not accord with public reason on a given question are those that cannot support a reasonable balance of political values on the issues that it raises." To illustrate, Rawls considers abortion and identifies three primary political values as being at issue: respect for human life, the reproduction of political society over time, and the equality of women citizens. According to Rawls, "Any reasonable balance of these three values will give a woman a duly qualified right to decide whether or not to end her pregnancy during the first trimester... any comprehensive doctrine that leads to a balance of political values excluding that duly qualified right to abortion in the first trimester is *to that extent unreasonable*" (p. 243, emphasis added). Furthermore, he notes that "a comprehensive doctrine is not as such unreasonable because it leads to an unreasonable conclusion in one or even in several cases. It may still be reasonable most of the time." (p. 243).

Rawls is not saying that a view proposed as a public matter which is derived from such a comprehensive

doctrine would be an unreasonable *application* of that doctrine to public political matters; rather, any comprehensive doctrine that would not support such a balance of values is "to that extent" an unreasonable doctrine. This means that even when an individual does not vote on the basis of her comprehensive views, when she believes that it would be unreasonable to try to institute such views as a political matter, by the tenets of political liberalism her views can still be classed as unreasonable. Thus, a Catholic who believes as an article of faith that status as a person begins at conception, but who does not believe that such a view can reasonably be defended by public reason and therefore does not, for example, seek to overturn *Roe v. Wade* (1973) (assuming this to constitute the correct balance of the political values at issue), will still be held by the tenets of political liberalism to hold a comprehensive view which is *to that extent* unreasonable. Paradoxically, so characterized, she would be a reasonable person but the holder of an unreasonable doctrine. But is the doctrine itself unreasonable, and should it be classified as such by an avowedly political conception? Or is its proposed *use* an unreasonable one, that is, *its use as a political doctrine*?

Consider what it means to say that a doctrine such as *extra ecclesiam nulla salus* (beyond the church there is no salvation) is an unreasonable doctrine. In one form or another, this is precisely the doctrine held by the Catholic church and numerous other denominations at the present time. For example, according to the *New Catholic Encyclopedia*:

The necessity of the church for salvation is illustrated in the Fathers by means of Biblical figures such as that of the ark in the deluge... Origen is the first to formulate the dogmatic axiom **Extra Ecclesiam nulla salus* (EnchPatr 557)... If the Catholic church is necessary for salvation, it follows that no one can be saved unless one belongs to the Church in some way or other (Emminyan 1967, 995-7).

Perhaps such a doctrine, which may appear to some as morally objectionable per se, conceals what is at issue here. One must keep in mind that there are plenty of religious prescriptions about which one justifiably may say it would be unreasonable to make them into law; but one would not be justified in saying, at least as a political matter, that they are unreasonable per se, that is, as religious doctrines applied within their own appropriate (i.e., nonpublic) domain. For example, in a religiously pluralistic society, it certainly would be unreasonable to propose that Talmudic dietary restrictions become national law, but are they therefore "unreasonable," or should they be classified as such? Religions contain numerous articles of faith affecting social relations among coreligionists: *Extra ecclesiam nulla salus* is just such a tenet. Those who hold this belief may accept the illegitimacy of having it—or political principles derived from it—imposed upon or applied to society at large; they may accept that, in Locke's words, ([1689] 1983, 31) "excommunication neither does, nor can, deprive the excommunicated Person of any of those Civil Goods that he formerly possessed." But as an associational belief in the non-

public domain and a manifestation of nonpublic reason, its truth or falsity, as well as its "reasonableness," should be outside the purview of an avowedly limited political conception.

I have observed how, according to this classification, a Catholic who adheres to public reason would be a reasonable holder of an unreasonable doctrine. But she may not be a reasonable person according to political liberalism, because of the very particular way in which Rawls defines a reasonable person. That definition raises all the same difficulties associated with the definition of a reasonable comprehensive doctrine as well as the further and even more perplexing question of whether an unreasonable person can still act reasonably. According to Rawls (1993, 48–54), one basic feature of reasonable persons is their readiness to propose and willingly abide by principles and standards that are fair terms of cooperation, given assurance that others will do likewise. So in this regard, the individual mentioned above who holds an "unreasonable" doctrine but believes it would be illegitimate to impose that doctrine upon others would be a reasonable person. Rawls adds, however, that reasonable persons also must recognize what he calls the "burdens of judgment" (pp. 54–8). These are meant to explain why, under conditions of freedom and the good faith exercise of our powers of reason and judgment, we generally end up with a plurality of comprehensive views rather than convergence upon one accepted view. As defined by Rawls (pp. 55–7), the burdens of judgment include such factors as the difficulty of weighing the relevant considerations in matters of "ultimate truth," the conflicting and complex nature of relevant evidence, and the influence of the particularities of our life situation on our view of the world and of the proper balance of values.

The problem with this formulation is that most religions, including those which accept the general principles of liberty of conscience and free faith, do not accept anything like the burdens of judgment. In fact, it is arguably necessary for any religion, if it is to present itself as a sure and infallible guide to the truth, precisely to deny them. As Leif Wenar (1995, 44) has noted: "A religious doctrine—as a purportedly authoritative guide to moral requirements and/or salvation—characteristically presents itself as universally accessible to clear minds and open hearts." Catholic doctrine, for example, explicitly denies the reality of anything like the burdens of judgment. Rather, it holds that, through revelation, "those religious truths which are by their nature accessible to human reason can be known with solid certitude, and with no trace of error, even in the present state of the human race" (*Dogmatic Constitution on Divine Revelation*, article 6, in Abbott 1966, cited in Wenar 1995, 44). So the hypothetical Catholic who abides by public reason and a principle of reciprocity would not be a reasonable person, because, let us assume, that as a believing Catholic she does not accept the burdens of judgment. In this case, we have an unreasonable person acting reasonably. But if an unreasonable person, or the holder of an unreasonable

doctrine, can act reasonably *for political purposes*, why classify doctrines—or persons—in this manner at all?

By such a classification, judgment is being passed upon religious doctrine per se in violation of Rawls's own division between the realms of public and nonpublic. If a theory, as well as a political regime, is committed to respecting the plurality of comprehensive views existing within society, then it appears that very little is to be gained by such a socially divisive classification as that between reasonable and unreasonable comprehensive views. Furthermore, as the abortion example shows, Rawls does not consider any balancing of political values as reasonable and appropriately so. But what appears questionable in this example is the specificity with which Rawls identifies what constitutes the correct balance on a given political question. In discussing the idea of public reason, Rawls maintains (1993, 226): "Accepting the idea of public reason and its principle of legitimacy emphatically does not mean, then, accepting a particular liberal conception of justice down to the last details of the principles defining its content. . . . Public reason does not ask us to accept the very same principles of justice." Here, however, for a comprehensive doctrine to be reasonable (in regard to the issue in question) and not "run afoul of public reason," it appears that it must in some way support the "last details" of the political principles.¹⁰

Why, then, does Rawls insist upon classifying comprehensive doctrines as reasonable and unreasonable? The answer, as I have noted, concerns his conception of an overlapping consensus—which ensures the stability of the regime—as a consensus only of reasonable doctrines. The implications of this are enormous. The point is no longer that all will accept the political conception as a "common ground," whatever their various comprehensive views, or will accept the reasonableness and necessity of a separation of church and state; rather, *all citizens will (ideally) hold only comprehensive views that support the political conception*. Thus, for all its commitment to taking seriously the fact of pluralism and the irreconcilable differences of diverse comprehensive views, and to separating public reason from nonpublic reason, Rawls's conception of an overlapping consensus points to a rather surprising unity, even homogeneity, of comprehensive views. Whatever their differences, all the comprehensive views held by citizens in society will (ideally) support a rather precise balance of political values. More specifically, the balance of moral and ethical values as articulated internally to each "reasonable" comprehensive view will support the appropriate balance of political values. It is this aspect of political liberalism that I call Rawls's "Rousseauism."

¹⁰ Rawls (1996, lv–lvi) has clarified what he intended by this example in the Introduction to the paperback edition of *Political Liberalism*. He says that his point was not to argue for a right to abortion in the first trimester but simply to show what a reasonable balance of the relevant political values might look like. Yet, this in no way affects the present criticism. I am questioning the specificity with which Rawls identifies what would constitute a reasonable balance on a given issue, not the content of the balance.

In the *Social Contract*, Rousseau ([1762] 1978, 131–2) writes:

Those who make a distinction between civil and theological intolerance are mistaken. These two intolerances are inseparable. It is impossible to live in peace with people whom one believes are damned. . . . Wherever theological intolerance exists, it is impossible for it not to have some civil effect. . . . Now that there is no longer and can never again be an exclusive national religion, one should tolerate all those religions that tolerate others insofar as their dogmas are in no way contrary to the duties of the citizen. But whoever dares to say *there is no salvation outside of the church* should be chased out of the State, unless the State is the church, and the prince is the pontiff.

Rousseau, then, denies the possibility of a stable regime if persons hold religious beliefs seen as conflicting with the virtues necessary for good citizens. Thus, in important ways, he denies the possibility of separating the public and nonpublic spheres: Only those religious doctrines are to be tolerated which are deemed to teach nothing contrary to the duties of citizens. While Rawls seems to embrace the possibility of the separation of these spheres, his idea of an overlapping consensus seems in surprising agreement with Rousseau. Only those comprehensive doctrines which support the proper balance of political values and the virtues of political liberalism will be part of an overlapping consensus; such citizens will constitute, as it were, the foundation and “true” citizens of political society, that is, its General Will.

Furthermore, Rawls (1993, 60) asserts that “reasonable persons will not think it reasonable to use political power, should they possess it, to repress comprehensive views that are not unreasonable, though different from their own.” The implication is that they may think it reasonable to suppress unreasonable views and, like Rousseau, “chase them out of the state.” In fact, Rawls believes “comprehensive doctrines that would suppress *if they could* liberty of conscience and freedom of thought” must be contained “like war and disease” (p. 64, emphasis added). What does “if they could” mean here? Is it counterfactual, that is, what the adherents of such views would do if they could, even if they are not attempting to do this? Or what it is assumed the adherents of such views would do if they could, because such political consequences are *implied* by, or *derivable* from, the comprehensive views they hold? The implications of this seem quite illiberal, for one must ask whether the principles of liberty of conscience and toleration are in danger of being compromised.

CONCLUSION

For Benhabib, “full” participants in the public dialogue must accept a postconventional morality. For Rawls, “full” participants in an overlapping consensus must accept a precise balance of political values and highly specific and controversial views about human reason (the burdens of judgment). For Benhabib, only followers of a postconventional morality, freed from a “rationality deficit,” can stay in the conversation “all the way.” For Rawls, the crucial fact is not the fact of

pluralism as such, but of reasonable pluralism. The problem with both these formulations is that modern democratic society as we know it is composed of numerous associations and individuals who embrace a conventional morality, do not support a precise “reasonable” balance of political values, and reject the burdens of judgment. Yet, these same persons and groups can and do accept basic democratic principles, the separation of church and state, and liberty of conscience (though, of course, there will always be some in every democratic society who do not accept these principles). How is this possible?

Liberalism claims that this can be achieved through bifurcation of a human being into a public and nonpublic entity, into a *homme* and *citoyen*. This is and will remain a difficult and delicate project involving a constant reevaluation of boundaries, for these two identities are never entirely distinct. We are all simultaneously persons and citizens. There is a constant temptation, however, to erase this distinction with all its inevitable tensions, even among those liberal and democratic theorists who in other respects appear to accept such a bifurcation and embrace a division between the public and nonpublic domains. To overcome bifurcation (*die Aufhebung der Entzweiung*, to borrow a Hegelian phrase) would require our nonpublic values, beliefs, and modes of discourse to cohere with our public (general-universal) values, beliefs and modes of discourse. The problem is that the “project” of such cohesion fails to respect difference and ultimately endangers pluralism. It involves collapsing, in one way or another, the boundary that separates the public and private. As Shklar (1989, 25) warned, the importance of maintaining this boundary, which while “a shifting line” is “not an erasable one,” must never be forgotten.

Partisan Cues and the Media: Information Flows in the 1992 Presidential Election

RUSSELL J. DALTON *University of California, Irvine*

PAUL A. BECK *The Ohio State University*

ROBERT HUCKFELDT *Indiana University*

Electoral research acknowledges the growing significance of the mass media in contemporary campaigns, but scholars are divided on the nature of this influence. Using a unique database that includes both media content and public opinion, we examine the flow of partisan information from newspapers to the voters and assess the press's role in electoral politics and citizen learning. We find that the American press does not present clear and singular messages about presidential elections but, rather, multiple messages about the candidates and the campaign. In addition, perception of the information is shaped as much by an individual's political views as by the objective content. Despite the mixed messages, we find that a newspaper's editorial content is significantly related to candidate preferences in 1992. These results challenge the minimal effects interpretation of the media, because local newspapers can play a significant role in providing cues that influence voters' electoral calculus.

Most of what voters learn about the political process and contemporary events is mediated through a variety of institutional and individual information sources. Most people have not met their elected representatives, attended a government hearing, or read the legislative proposals under consideration by Congress. Nevertheless, people form impressions and evaluations of these actors and events through the information provided by intermediaries, such as the media, political organizations, and people with whom they discuss politics. The most regularly used information source, by virtually all accounts, is the mass media, especially television and the press.

The media's role as an intermediary is most evident at election time, when the media are the primary conduits for information on the campaign. Few voters attend a rally or have direct contact with the presidential candidates or their representatives. Instead, information presented in the media provides people with cues about the policy positions, qualities, and abilities of the candidates. The media also report on the progress of each campaign, including how the American public is reacting to the candidates and their messages. From this information, as well as other sources, the public forms its images of the candidates and its voting choices.

Russell J. Dalton is Professor of Political Science, University of California, Irvine, CA 92697; Paul A. Beck is Professor of Political Science, Ohio State University, Columbus, OH 43210; and Robert Huckfeldt is Professor of Political Science, Indiana University, Bloomington, IN 47405.

This research was supported by a grant to the authors from the National Science Foundation (SES 91-23519); Russell Dalton and Holli Semetko received supplemental support from the Joyce Foundation for the media data collection. We want to acknowledge the foundation's support for this research and Professor Semetko's willingness to share these results. A previous version of this article was presented at the annual meetings of the American Political Science Association, San Francisco, September 1996. We would like to thank Lee Becker, Audrey Haynes, Shanto Iyengar, William Koetzle, Ruediger Schmitt-Beck, Holli Semetko, and the anonymous reviewers for their comments on this research.

How does this learning process work? Some analysts posit that the media have a direct influence on the public by reinforcing partisan predispositions or persuading voters to support particular candidates (e.g., Bartels 1993, Noelle-Neumann 1984, Zaller 1996). The predominate position in the literature, however, is that the media affect what factors to consider in judging the candidates by the way they present the topics of the campaign (Iyengar 1991, Iyengar and Kinder 1987, Patterson 1993). The media thus shape how the public thinks about the candidates rather than influence candidate preferences per se. Despite widespread acceptance of the media's important role in disseminating political information, scholarship remains divided on the central questions about the nature and effect of this information.

Our research addresses the question of media influence from a methodological perspective different from the one that has dominated scholarly research in recent years. In a tradition largely neglected since the days of the Columbia studies of voting (Berelson et al. 1954, Lazarsfeld et al. 1948; but see Patterson 1980), this article examines the direct persuasive influence of the media. Our specific interest is whether the content of press reports affects partisan preferences at election time.

It is curious that media research has not focused on the press, where variation in media content is most likely to be found. Instead, most studies have concentrated on television coverage of campaigns. Opinion surveys routinely show that television is most often cited as a source of political information, and its visual power has drawn scholars to research this medium. Yet, television news coverage is less likely to show systematic partisan bias in election content because of its history of government regulation, its origins in an advertising rather than a partisan culture, and its need to address a national viewership. Since the three networks have developed a largely impartial orientation, television seems less likely to influence partisan preferences directly. One can argue that partisan cues are

more likely to be found in newspapers because of their greater variety in ownership, differences in circulation bases, and earlier traditions of party-aligned reporting. Yet, studies of newspaper coverage of campaigns have not focused on variation in partisan content, and no comprehensive national study of newspaper coverage of a presidential election has ever been undertaken.

Our research represents the first national examination of how the print media actually presented a presidential campaign and how this information was perceived by voters and potentially influenced their preferences. We assembled a nationally representative collection of newspaper coverage of the 1992 presidential election. These data enable us to describe and analyze the political information that Americans received from their daily newspapers as well as the variation in coverage across the nation. With a parallel survey of the readers of these newspapers, we also assess how individuals perceived the political cues the press provided on the candidates and issues and whether this information influenced voting choices.¹

Even more important, by examining the complete intermediation process for newspapers—from the content of the media to its effect on voters—we can test general theories of political learning and the nature of media influence. For instance, there is basic disagreement on the accuracy with which people perceive the political cues emanating from the media and on the factors that influence these perceptions (Neuman 1986, Zaller 1992). We can examine this linkage with our empirical evidence. In addition, the literature is unclear about how the information provided by the media is integrated into predispositions and thus influences political preferences. Our merger of objective media content and attitudinal data enables us to examine this complex process.

The findings of this study speak to several important questions in the current debate on the media's role in American electoral politics: the content of the press's coverage of presidential elections, the potential for media bias in election coverage, and the influence of newspapers on their readers. Because of the public's reliance on the media as an information source, the answers to these questions address an essential aspect of the democratic process: the role of the press as information provider.

TRACING INFORMATION FLOWS FROM THE PRESS

Early communications scholars feared that the modern mass media would be a powerful instrument of partisan persuasion and propaganda. These concerns lessened with the first empirical studies of the media's influence in elections (Berelson et al. 1954, Lazarsfeld et al. 1948). The results gave rise to the so-called minimal

effects view: The media do not appear to exert a major persuasive influence on partisan preferences (Klapper 1960). The contemporary view is that media influences are primarily the cognitive effects of agenda-setting and framing how events and candidates are perceived (Iyengar and Kinder 1987, McLeod et al. 1994).

At the same time, other researchers have continued to explore the media's potential for persuasion. Robert Erikson (1976) found that a newspaper's editorial endorsement was significantly related to county-level voting patterns. John Robinson (1974) and Steven Coombs (1981) also documented a direct relationship between newspaper endorsements and the voting patterns of readers. Elisabeth Noelle-Neumann (1984) claimed that the media can have a strong influence on voting preferences when their message is clear and consistent. Larry Bartels (1993) showed that measurement error may significantly attenuate estimations of media effects, and he argued that the direct influence is much stronger than previously recognized. John Zaller (1996) provided new evidence that media content can affect policy preferences and political evaluations. In summary, there is evidence that media content can have a direct influence on public opinion and, specifically, voting preferences.

The First Stage

Our research traces the flow of political information from newspapers to the voter and then assesses the effect of this information on partisan choices. This requires that we examine the flow through several distinct stages.² The process begins with the information provided by the press. At this stage, we are concerned with clarity and direction of the political signals disseminated through the media. The strength of political cues in a newspaper's election reporting presumably affects the accuracy of their reception and ultimately their effect.

The nature of the information provided through the media also has fundamental implications for its potential persuasive effects. For example, Zaller (1992) and others (Noelle-Neumann 1973, Ross et al. 1976) argue that uniformly one-sided messages ("one message model") promote conformity to the message and are powerful sources of persuasion. Differentiated messages (Zaller's "two message model") are cognitively more complex and force receivers to search for cues about which messages to believe. Thus, the nature of political messages provided by the press has important consequences for the direction and degree of the public's response. By examining the content of the press's coverage of election campaigns we can determine the initial characteristics of this information process.

Surprisingly, prior research has not produced systematic information on the degree to which American

¹ Another component of this project is the cross-national replication of the basic design by research teams in Germany (Max Kaase, Hans-Dieter Klingemann, Manfred Kuechler, and Franz Urban Pappi), Great Britain (John Curtice, Anthony Heath, and Roger Jowell), Japan (Hiroshi Akuto), and Spain (Richard Gunther, Bradley Richardson, and Jose Ramon Montero).

² This is a simplified variant of McGuire's (1985) multistep process of information flow. We feel, however, that the three stages we examine constitute the core of the process and represent major empirical elements of media influence.

newspapers provide clear partisan cues and evaluative information to their readers. Several studies describe the coverage of the presidential candidates in the elite press and track these trends over time (e.g., Graber 1993, chapter 6; Stempel and Winhauser 1991), but they are limited in several respects. Most research focuses on only a few elite newspapers or local newspapers to lessen the burden of coding media content. Although the *New York Times* may consider that it publishes "all the news that's fit to print," it is read by only a small fraction of the American public.³ The typical voter reads a local newspaper with limited circulation, and these local papers may vary considerably in their partisan cues. Thus, to assess the information provided by the media, one needs to evaluate a sample of newspapers that represent the range of American media.

In addition, the coding of the information content of the press has not been fully satisfactory. Political communications research often relies on surrogates or partial measures of content. For instance, several analysts have used a newspaper's editorial endorsement as a measure of its partisan content (Coombs 1981, Erikson 1976, Robinson 1974); others have explicitly excluded editorial material (e.g., Stempel and Winhauser 1991). Studies of news content also have variously measured only headlines or articles appearing on the first page. Because of these different approaches, it is not surprising to find that prior research yields ambiguous conclusions about what partisan cues the press provides. Statistics on editorial endorsements show that fewer newspapers now explicitly endorse a presidential candidate (Stanley and Niemi 1994), and there is evidence of a general decrease of partisanship among the contemporary press (Rubin 1981). Conversely, others argue that the press has become more openly critical of politicians and has created unfavorable candidate images (Sabato 1991), although substantial empirical evidence of these effects has been lacking. Campaign organizations, often all of the parties and candidates, routinely claim that the media are projecting biased images of their candidate (see discussion in Patterson 1993, chapter 5). What is needed is a full and direct assessment of the partisan cues provided by the press so that we can generalize about the nature of election coverage.³

The Second Stage

The second step in the process of information flow involves readers' perceptions of the objective content of the media. How accurately do readers assess the partisan content of their daily newspapers? The primary source of reader perceptions should be the objective information provided by the media, but that is potentially diverse. There is an ebb and flow to election campaigns, so a single source may report positive news on a candidate one day and negative news the next.

Even the same event is open to multiple interpretations, and these contrasting views may be expressed in a single article or separate reports. Furthermore, newspapers often print several different campaign articles in the same issue, and the partisan direction of each may vary. There is also variation between the news coverage of a campaign and what appears on the editorial pages. The interaction between news and editorial reporting may affect the clarity of the message the press conveys. We will explore how alternative sources of political cues, such as news coverage versus editorial content, shape a paper's partisan image among its readership.

Beyond the objective information, a reader's own characteristics may determine his or her perceptions of the media's message (Becker and Kosicki 1995). For example, research on information flows often shows that individuals project their predispositions onto information sources (or screen out opposing messages), unless the source provides an unavoidable message (Klapper 1960, McGuire 1985, Zaller 1992). Yet, research has found a much different process at work for media usage. Robert Vallone and his colleagues (1981) presented evidence of a "hostile media phenomenon" in the 1980 election; they found that most Americans evaluated media treatment of presidential candidates as fair and impartial, but when voters perceived bias in media coverage, they typically saw the source as opposing their preferred candidate (also see Beck 1991).

In addition, several different research approaches suggest that political sophistication or attentiveness may influence the accuracy of perceptions. For example, it is claimed (Neuman 1986, Zaller 1992) that political attention and political sophistication may increase the public's accuracy in perceiving political cues and thus enhance media effects. Research on political learning from the media seems to reinforce this point (Neuman et al. 1992, chapter 6). This literature suggests a potential interaction between political sophistication and the awareness of political cues. We will explore these possible interactions as part of the perceptual process.

The Third Stage

The last stage of the process involves the effect of media-based information on political choice. The literature stresses that individual characteristics interact with the message to determine media effects, but the nature of this interaction is disputed. For instance, there is a general belief that partisan predispositions condition media effects, but the nature of these influences is debatable (Schmitt-Beck 1996, 276). If we draw a parallel to the party contact literature, for example, then a hostile media may either mobilize or demobilize partisans. Do Democrats reading a paper that prefers Bush shift toward the Republican candidate, or does this news about the opposition motivate them to support Clinton even more? Either option is theoretically possible, but only empirical evidence can determine which is a more accurate description of reality.

Research also suggests that political sophistication

³ There are political cues and influences of the press beyond the direct partisan cues we examine here (see, e.g., Bennett 1995, Edelman 1988, Patterson 1993).

may affect the nature of media influences, although the pattern of influence is debated. Scholars such as Zaller (1992) claim that while the politically sophisticated may be more attentive than others to political cues, their greater awareness may create a stock of political information that lessens the media's persuasive effects. Consequently, there are reasons to expect stronger media effects among the less sophisticated—if media cues are perceived in the first place. Conversely, uses and gratification theory suggests that highly interested individuals have a greater need for orientation, which facilitates their attentiveness and media influence (Weaver 1980). Both expectations are plausible, which led Philip Converse (1966) to suggest a curvilinear model of persuasive effects.

Summary

The media are a major source of political information for Americans, but the nature and influence of this information flow are unclear. The sheer number of newspapers and their history of partisanship create great potential for diversity in the message being sent to voters in different locales, but we do not yet know the clarity of the media's partisan content during a presidential election. Moreover, there are fundamental unanswered questions about how the information presented by the press is perceived by the public. How clearly do people perceive partisan cues that may emanate from the press, and what factors shape these perceptions? Finally, does the information gained through the media influence partisan choice? Research provides insights into selective parts of this process, but the whole process has not been examined in a nationally representative project. This may explain the contrasting claims that the media has strong or minimal influence.

Our goal is to examine the workings of the information process to help answer these questions. Yet, ours is also a limited goal. Newspapers are only one part of the media equation in modern campaigns. Most individuals, in fact, claim that television is their primary information source. If the media have a persuasive influence, however, then this should be most apparent for the press because of its partisan history and potential for variation, so this is the focus of our research.

DATA RESOURCES

Our study provides an unusual opportunity to look at the complete information flow from the press to the voters. The core of our analysis is the first nationally representative sample of newspaper coverage of a presidential election. We began by randomly selecting 40 counties to represent the American population (see the Appendix). For each we then coded the major daily newspaper read by county residents for a sample of days during the 1992 presidential campaign. This produced a sample of newspapers representative of those read by a cross-section of the American public (the list is included in the Appendix). Our research team analyzed the campaign coverage of these 46 newspa-

pers between Labor Day and election day. We coded 6,537 items, including news coverage of the campaign, news analyses, opinion and editorial articles, political cartoons, and letters to the editor. We coded each for its location in the paper, presentation, and topics covered. More directly relevant to this research, we also coded each item for its overall evaluative content regarding the Bush, Clinton, and Perot campaigns.

This content analysis was done in conjunction with interviews of a nationally representative sample of people who lived in the counties served by these newspapers (see the Appendix). A total of 1,318 telephone interviews were completed after the election. Among other questions, we asked respondents what newspaper they read, how attentive they were to political news, and whether they felt their daily newspaper leaned more toward one presidential candidate than another. Finally, we collaborated with a study of television coverage of the 1992 election, and we include some preliminary data from this project.⁴

The analytic strength of our research is based on the potential content variation across the newspapers in the sample. We expected to find significant variation, since the range is from the recognized elite press (*New York Times*, *Washington Post*, and *Los Angeles Times*) to small town dailies (such as the *Paris News* in Paris, Texas) and includes newspapers with diverse political leanings. Given this range, we can determine whether readers can accurately perceive the political cues provided through the press and the factors that affect these perceptions. We also can examine whether election reporting influences voter choice and the factors affecting this calculus.

PRESS COVERAGE OF THE 1992 PRESIDENTIAL CAMPAIGN

One of the most debated aspects of the 1992 election was the role of the media in the campaign. At the Republican convention the criticisms of the media were almost as loud as the cheers for the party's nominee. Bush held up bumper stickers proclaiming "Annoy the Media: Re-elect George Bush," and there was a lively trade in T-shirts that read "Blame Me: I'm with the Media." Clinton's advisors similarly claimed that the media followed a double standard, focusing on the challenger while exempting Bush from the same kind of scrutiny. When the election was over, Perot's former press aide blamed the media for creating an unfairly negative image of his candidate. Indeed, the subtitle of the 1992 campaign might be "blame it on the media."

The 1992 campaign reflects the continuing debate on the role of the media in modern democracies. What cues does the press provide voters on the strengths and weaknesses of the contestants in an election? How much do they favor one candidate over another? What influence does this information have on electoral choices? The answers have basic implications for the

⁴ For additional information on the television analyses, see Semetko 1996.

TABLE 1. The Evaluative Content of Election Coverage

	News Reports			Editorial Reports			Television Reports		
	Bush	Clinton	Perot	Bush	Clinton	Perot	Bush	Clinton	Perot
Extremely positive	0.1%	1.0%	0.1%	0.7%	0.7%	0.8%	0.0%	3.7%	0.7%
—	3.1	17.0	5.8	5.7	9.5	4.2	2.2	15.9	2.5
—	7.7	25.4	13.3	5.9	17.9	10.5	7.1	14.5	7.3
Balanced	31.0	32.5	38.8	21.0	29.1	24.9	24.5	27.8	17.8
—	32.3	11.8	20.5	33.0	23.3	27.0	28.9	10.7	13.1
—	17.7	4.5	9.3	26.2	13.1	24.9	15.0	4.0	10.9
Extremely negative	1.2	.4	.7	3.9	1.3	3.4	3.3	0.0	4.0
No evaluative content	6.8	7.5	11.6	3.6	5.1	4.4	19.0	23.4	43.6
Total	100%	100%	100%	100%	100%	100%	100%	100%	100%
Mean score	3.39	4.44	3.82	3.19	3.84	3.13	3.29	4.51	3.43
(N of articles)	(3,039)	(2,823)	(1,523)	(1,094)	(989)	(503)	(453)	(428)	(275)

Note: Table entries are coders' assessment of the evaluative content of articles/stories from the perspective of each campaign. News reports include only news articles and news analyses in which the campaign was a visible part of the story; editorial reports include editorials by the newspaper and op/ed columns presented in the editorial section in which the campaign was discussed; television reports include all stories in which the campaign was visible. Mean scores are based on the 1-7 scale. The dashed lines indicate intermediate values on the 7-point scale, which were not labeled on the coding guide.

nature of electoral politics and the quality of information upon which voters must decide.

One of our central concerns is whether the press presented a strong partisan message in coverage of the 1992 campaign. We assessed the overall evaluative content of each newspaper article by judging whether it created an image that would be positively or negatively viewed by the respective campaigns.⁵ Coders scored each article on a seven-point scale (1 = extremely negative, 7 = extremely positive).⁶ For example, a generally positive article on Bush's well-received economic policy speech in Detroit would receive a positive score; but if an article contrasted the speech with Bush's record on the economy and his prior vacillation on economic policy, the story might receive a negative score.

Clearly, there are many elements to election reporting, as discussed in other media analyses (e.g., Bennett 1995, Patterson 1993), and the media's influence may occur in subtle ways. Nevertheless, the overall evaluative content of articles taps a central political cue that

the media provide on the election: who is presented positively and who is presented negatively. Like the partisan cues of friends or social reference groups, this aspect of media coverage provides voters with guidance on their electoral choice from a known and generally credible information source. Moreover, it is exactly this aspect of media content that underlies much of the research on media effects on voting preferences (e.g., Erikson 1976, Noelle-Neumann 1984) and occupies the harshest critics of the media.

We first focused on articles that reported news about the campaign.⁷ We examined news reports or news analyses in which the campaign was a significant part of the story; this excluded editorials, op/ed pieces, letters to the editor, and other nonnews campaign reports. Table 1 displays the evaluative content of 1992 election coverage. Roughly one-third of all news articles presented a balanced view; that is, the evaluative content favoring one candidate was matched by negative news (or equivalent coverage of a rival campaign) in the same story. Relatively few (roughly one-tenth) news articles contained no evaluative content; these provided straight factual information on the campaign. Articles on the Perot campaign most often lacked clear political cues for the readers.

Most news articles contained at least some evaluative content, such as whether one campaign was doing well or another was faring poorly. In 1992 the imbalance in this reporting was clear: Newspaper coverage of the Bush campaign was predominately negative. Whereas 51% of all news articles conveyed a negative image, only 11% reflected positively on Bush's campaign. By comparison, 17% of news articles on the Clinton campaign were negative, while 43% had positive evaluative content. References to Perot were lacking from most articles until October, when he reen-

⁵ We created three separate variables in coding the overall evaluative content of each article in terms of the Bush, Clinton, and Perot campaigns. The instructions for the Bush variable were as follows: "Code the overall content of the article that involves Bush, Quayle, or the Bush/Quayle campaign in terms of its favorability or unfavorability to the Bush campaign. Evaluate the article from the perspective of the Bush campaign and assess the content of the article from this perspective. In other words, would the Bush campaign like seeing this article in print? If an article only focuses on Clinton (or other actors), then do not evaluate the Bush/Republican bias. If both candidates/campaigns are mentioned in the same article, then treat these as separate coding judgments; that is, an article might be negative to both candidates, positive to both, or a mix." (This was followed by examples of coding.)

The evaluations were coded on a seven-point scale: 1 = extremely negative, 7 = extremely positive. If the article contained no information that would lead to an evaluation of the candidates or the parties, then it was coded as "no evaluative content" (8).

⁶ After the first weeks of coding, we conducted intercoder reliability checks. A set of articles were double-coded to assess the reliability of our media measures. The evaluative content measures displayed high levels of reliability for each campaign; unfortunately, the data used to calculate the specific reliability coefficients were lost in a computer malfunction.

⁷ Each article was coded for its general type. News articles were reports on specific events that had occurred during the previous 48 hours. News analyses went beyond reporting the specific events; often these were reviews of the candidate's position or of campaign strategies.

tered the campaign. Among the stories on Perot with an evaluative content, the negative outnumbered the positive by three to two.

Journalists may strive for balance and objectivity in the reporting of partisan or election news, but the political cues of the press tend to be more apparent in editorial pages. The last vestige of an earlier tradition of many papers as party propagandists, editorial positions are an important part of a newspaper's political identity. Therefore, we also examined the evaluative content of editorial pages. The second panel of Table 1 presents the evaluative content of editorials and op/ed pieces that explicitly dealt with the 1992 presidential election. These data accentuate the patterns found in news reports. Both Bush and Clinton received more critical editorial treatment, but their relative ranking was similar to that for news stories. The one significant difference is that Perot was treated much more critically in the editorial statements than he was in news reports.

The third panel of Table 1 presents comparable data from television reports on the campaign, which contained less evaluative content than press reports. Roughly half of all television news reports gave balanced views of the candidates or lacked evaluative content, but the general treatment of the candidates was similar to that in the press.⁸ Both media presented more favorable reports on the Clinton campaign and more critical reporting of the Bush campaign. Perot received intermediate coverage by both media, and both devoted much less attention to his candidacy. Marion Just and colleagues (1996, chapter 5) used a different method but found a similar overall ranking of the 1992 presidential candidates in their coding of tone in network news and a small set of local newspapers.

Why did the Bush campaign fare so poorly in the media (also see Just et al. 1996, chapter 5)? One explanation lies in campaign style. In a separate coding of actions on the campaign trail, we found that Bush pursued a predominately negative strategy: attacking his opponents, criticizing their politics, and belittling the opposition (e.g., his "Ozone Man" comments about Albert Gore).⁹ When Bush was an actor in a story, he pursued such negative actions 33% of the time. In contrast, Clinton was more upbeat and optimistic, advocating new policies and stressing the positive. We found that candidate style was strongly correlated with the overall evaluative content of articles, even though

these are conceptually separate aspects of media coverage and were independently coded. A negative approach often yielded a story with negative evaluative content, perhaps because controversy stirred up reaction, especially if journalists tried to balance negative comments with a rejoinder from the other campaign.¹⁰ In short, Clinton ran a presidential-style campaign that benefitted his candidacy; Bush did not.

The Bush campaign further suffered because of its content. The economy was prominent among voters' concerns and campaign coverage (Dalton et al. 1995). Stories about the economy or federal budget showed the Clinton candidacy in a relatively positive light, while the Bush campaign emerged from such stories with a negative image of trying to defend its economic policies or attack its critics—this area showed the largest lead for Clinton in the relative favorability of election coverage. Another important news topic was the campaign itself, and the Bush candidacy also suffered in this regard. Struggling to define an identity for the campaign, reversing strategy, and openly trying to unify the party's diverging factions, the Bush effort hardly could avoid presenting a negative view of itself in 1992. In contrast, the Democrats were, for a change, unified and well organized. Even in the areas that might be considered strengths of the Bush campaign, such as foreign policy and candidate characteristics, Clinton's coverage was more positive than Bush's. In short, the Bush campaign was never able to define an agenda that advantaged its candidate, as it had in 1988. As other media analysts have observed, turning the Bush campaign into a positive news story in 1992 would have required a large positive bias in reporting actual events (Pomper et al. 1993, Weisberg 1994).

We also considered whether the evaluative content of election reporting reflected overt partisan bias by the press. This is an admittedly difficult judgment to make. Negative or positive news is not necessarily an indicator of media bias—it may reflect an accurate view of the relative performance of each campaign. To test for possible media bias, we separately coded the tone of coverage to see if journalists added their own evaluations to their reporting of the news.¹¹ They seldom did so. Almost two-thirds of all news articles were purely descriptive (61.2%); in another one-sixth (16.3%) the journalist had mixed observations about the news being reported. Barely one-sixth (17.3%) included evaluative comments from the reporter, and these were almost evenly balanced between comments

⁸ The newspaper and television content data were separately coded by research groups working at the University of California, Irvine, and the University of Michigan. Both groups used the same coding protocol and instructions.

⁹ The coding instructions were as follows: "This is a judgment of the actions(s) taken by the main actor. First, judge whether the actor is taking a critical or an affirmative action; then code the intensity of this action. Not all stories have actors who are taking actions with an evaluative dimension; thus, there are separate codes for balanced and neutral stories. To illustrate: if the essence of the article is 'Bush strongly supports a capital gains tax,' then this is an affirmative action. If the essence of the article is 'Clinton criticizes North American Free Trade Agreement,' this is a critical statement." These evaluations were coded on a seven-point scale (1 = extremely critical, 7 = extremely affirmative).

¹⁰ Although this evidence is indirect, it tends to undercut the arguments on the effectiveness of negative campaigning (Ansolabehere and Iyengar 1995); for additional empirical evidence challenging the negative campaigning thesis, see Brians and Wattenberg 1997.

¹¹ This variable was derived from Semetko et al. 1991. It determines whether the journalist added identifiable material that was intended to reinforce or undermine the message of the primary actors in the article. The coding instructions were as follows: "Were there identifiable comments by the reporter that reinforced (or reflected positively on) the candidate's actions or deflated the message of the candidate (negative comments or diminishing comments), or is the reporter making simple descriptive comments or straight comments with no evaluation?"

FIGURE 1. The Evaluative Content of Press News Articles about the 1992 Election

Note: Figure entries are mean scores on the 7-point evaluative measures, expressed as deviations from grand means (Bush mean = 3.41; Clinton mean = 4.45). $N = 46$.

that either reinforced or undermined the candidates' statements. Thus, the overall evaluative content of campaign news did not reflect the explicit comments of journalists.

In the end, however, we are primarily concerned with whether the press presented partisan cues in 1992, rather than the source of these cues. Although the press speaks in mixed messages and varied tones, there were significant partisan cues in newspaper coverage of the 1992 presidential campaign.

Variations in Press Reports

The overall content of election coverage tells us which candidates were generally favored in press reports, but these aggregate statistics do not describe the specific information available to readers of individual newspapers. Indeed, the number and diversity of newspapers in the United States offers the potential for great variation in the evaluative content of press reporting. There is anecdotal evidence that newspapers (and journalists) can be very partisan in their coloration of the news. Other evidence suggests that newspapers have gradually and steadily lessened any explicit partisan leanings. Our sample of newspapers enables us to examine the degree of diversity in the partisan cues actually disseminated in the American media.

Figure 1 presents the averages for the evaluative content of news articles about the Bush and Clinton campaigns for each of the newspapers in our sample. To provide a common metric across separate figures, these data are expressed as deviations from the overall mean for each campaign. (In absolute terms, every newspaper in our study was more positive in its relative coverage of the Clinton campaign!). The range of evaluative content regarding both campaigns was modest. Most newspapers hovered fairly close to the overall mean (the standard deviation is approximately .30).

For example, the *Washington Post*, which scored .17 above the overall mean for Bush and $-.08$ for Clinton, was more typical in its campaign coverage than such local papers as the *News Sentinel* of Fort Wayne, Indiana (.55, $-.16$), or the *Post-Standard* of Syracuse, New York ($-.74$, .48).¹²

There are several ways that we can measure the clarity of partisan stimuli emitted by specific newspapers. In aggregate terms, there is a strong negative correlation in the treatment of the Bush and Clinton campaigns ($r = -.68$); papers that favored Bush tended to be critical in their reporting on Clinton.¹³ Equally important, the information presented by any single newspaper provides multiple perspectives on each campaign. This can be seen by using the newspaper as an independent variable to predict the evaluative content of news reports. The correlation between the newspaper and the evaluative content of news articles was modest for the Bush campaign ($\eta = .25$), the Clinton campaign (.25), and the Perot campaign (.21). This means that although the differences *between* newspapers in their overall reporting of each campaign were substantial, the differences in reporting *within* newspapers was also considerable. In short, although U.S. newspapers differed somewhat in their reporting of the campaign, they also contained multiple messages on each campaign for their readers.

We replicated these analyses for the editorial coverage of the 1992 campaigns, that is, both editorial statements and op/ed pieces. When compared to Figure 1, Figure 2 shows that newspapers differed more in the partisan content of editorial material than in their news reports. Entirely as expected, editorials contained more evaluative content and varied more distinctly across newspapers. For instance, the standard deviation in the evaluative content of editorial material was nearly twice that of news articles. In addition, the correlation between the newspaper and the evaluative content of its editorials is somewhat stronger than for news reports: Bush campaign ($\eta = .36$), Clinton campaign (.34), and Perot campaign (.35). Yet, the correlation between coverage of the Bush and Clinton campaigns in Figure 2 is slightly weaker ($-.59$) than for news coverage ($-.68$) in Figure 1.

We contend that individual newspapers often present multiple, conflicting messages regarding the candidates. The clearest evidence comes from comparing the news and editorial coverage of the three campaigns. As an illustration, Figure 3 plots evaluative content in news coverage and editorials on the Bush candidacy. There is a very weak ($r = .15$) correlation between these two elements of campaign reporting. We obtained similar results for the evaluative content of reports on the Clinton (.35) and Perot (.13) cam-

¹² Since so much research is devoted to the elite press, we should note that newspapers in that group tended to be fairly balanced in their reporting of both campaigns: *New York Times* (.02, $-.07$), and *Los Angeles Times* ($-.29$, $-.09$). Greater variation in reporting was displayed among the local dailies.

¹³ The evaluative content of news coverage of the Perot campaign was positively correlated with evaluative content coverage of both the Bush ($r = .26$) and Clinton ($r = .13$) campaigns.

FIGURE 2. The Evaluative Content of Editorial Press Coverage of the 1992 Election

Note: Figure entries are mean scores on the 7-point evaluative measures, expressed as deviations from the grand means (Bush mean = 3.20; Clinton mean = 3.79). $N = 41$, not 46, since newspapers with less than 30 coded editorial articles were excluded.

paings. To some extent, the weak association is surprising. Many assume that a newspaper's editorial stance strongly colors its reporting of the news, whereas our data suggest a significant degree of autonomy. This also can be seen if we compare the editorial endorsement of newspapers to their coverage of the campaign. Although fewer and fewer papers formally endorse a presidential candidate, an endorsement often is assumed to be a surrogate of the paper's political position that will be reflected in its news coverage. Our study shows not only no relationship between newspapers' formal endorsements and their news coverage of the campaign but also a very weak relationships between the endorsements and the overall content of their editorial pages.¹⁴ For instance, the newspapers that endorsed Bush were slightly more negative in their news coverage of his campaign (55% negative) than papers that endorsed Clinton (50% negative toward Bush). Similarly, papers that endorsed Clinton were slightly less positive in news articles about their preferred candidate (42% positive) compared to papers that endorsed Bush (47%). If anything, these findings suggest that newsrooms display views independent from those of their editors.

Taken together, these results provide strong evidence of the general separation of campaign reporting and editorial opinions in America's print media. Contrary to common claims in the literature (e.g., Bagdikian 1992), newspaper ownership and editorial control apparently color the reporting of presidential campaigns less than they may have when newspapers were more openly aligned with a party or political

¹⁴ The correlations between editorial endorsement and evaluative content of news articles is insignificant for coverage of both the Bush ($r = .01$) and Clinton ($r = -.02$) campaign. Even the correlations between newspapers' endorsement of Bush and editorial content toward the Bush ($r = .08$) and Clinton ($r = -.04$) campaign are weak, albeit in the expected direction.

FIGURE 3. Bush Coverage in Press News Reports and Editorial Coverage of the 1992 Election

Note: Figure entries are mean scores on the 7-point evaluative measures of news coverage and editorial coverage of the Bush campaign, expressed as deviations from grand means. $N = 41$.

orientation. Even if some editors and some newspapers still project a clear partisan image of election campaigns through their news reporting, this is relatively rare.

From the perspective of information flows, our findings imply that the typical American voter reads a newspaper that differs modestly from other newspapers in its overall evaluative reports on the presidential election. Compared, for example, to the classic case of the British partisan press, American newspapers are fairly neutral in their reporting on the campaign. Equally important, most newspaper readers are exposed to multiple evaluative messages about the campaign from the same newspaper, not a single and clear partisan perspective. The evaluative content of a paper's news reports was relatively independent of the information provided through editorial pages for the 1992 campaign. Indeed, several newspapers offered a positive image of a candidate on the editorial page and a contrasting view in news reports. The diversity of the message also existed within the news and editorial sections. Some news articles presented a positive image of the Bush (or Clinton) campaign, and the next section of the same article or the next news article presented a contrasting view. Indeed, contemporary American journalistic norms stress balance and objectivity in political reporting, and a common way to present the information is by intermixing positive and negative accounts. Thus, the partisan information flows derived from the press conform to Zaller's (1992) notion of multiple messages, giving voters a wealth of material and a diversity of evaluative cues from which to make their judgments.

READERS' PERCEPTIONS

The next stage in the process of political intermediation involves the public perceptions of the messages

TABLE 2. Perceived Favored Candidate by Information Sources

Favored Candidate	Daily Newspaper	Nightly TV News	Personal Discussant
Bush	12%	4%	34%
Clinton	40	33	41
Perot	1	1	15
Mix of candidates	1	1	1
Did not favor a candidate	42	55	2
Not sure	4	4	7
Total (N)	100% (1,101)	98% (1,112)	100% (1,068)

Note: Table entries are the public's perception of the political leanings of various information sources from the national survey of 1,318 respondents.

presented by the press. How do ordinary voters, without a staff of coders and coding rules, see the political cues in their daily newspaper? We know from prior studies that people often perceive their newspaper as leaning toward one candidate or another, but research has seldom matched these perceptions against reality. One of the most significant features of this study is our ability to compare press campaign coverage to readers' perceptions of these same newspapers.

Following the election we conducted a telephone survey of residents in the 40 counties of our study. The respondents were asked what presidential candidate was favored by their daily newspaper, as well as by the national TV network newscast they watched most regularly and the persons with whom they regularly discussed events.¹⁵ As shown in Table 2, the most common response described newspaper and television coverage of the campaign as not favoring any candidate. When there was a perceived bias, more people saw their local newspaper, as well as their preferred network TV news program, as leaning toward Clinton in 1992, with Bush a distant second and Perot receiving a mere trace of support.

There is also a significant contrast between respondent perceptions of the media and the people with whom they discussed important matters. Respondents often saw the media as neutral in the campaign, but they viewed almost all personal discussants as having a favorite candidate. Furthermore, the political leanings of discussants closely mirrored the 1992 election outcome, with Clinton displaying a slight lead over Bush; Perot supporters roughly matched the candidate's actual vote total.

In aggregate terms, there is at least no inconsistency between public perceptions of the press and the results described in the previous section. We found that most newspapers did not take strong partisan stands, and a

¹⁵ The question were: "Which presidential candidate do you think the [respondent's daily paper] favored during the campaign, or didn't it favor any candidate?" "Which presidential candidate do you think [respondent's daily network TV program] favored during the election campaign, or didn't it favor any candidate?" "Which candidate do you think [respondent's first named discussion partner] supported in the presidential election this year?"

large proportion of the respondents did not perceive their daily newspaper (or television news program) as preferring one candidate. The evaluative cues that were present in the press generally favored the Clinton campaign; public perceptions mirrored these leanings.

The real test of the accuracy of the public's perceptions, however, comes from comparing readers' perceptions to the content of their daily newspaper. The recognition of political cues is a complex process. In part, it depends on the clarity and visibility of the message. For instance, it is relatively easy for Britons to perceive accurately the political leanings of their highly partisan press (Curtice and Semetko 1994). American newspapers are normally temperate in campaign reporting, but there was substantial variation in the evaluative content of the newspapers we studied. Still, Zaller's (1992) distinction between single and multiple message models suggests the following hypothesis: Newspapers that present a clearer partisan message are more likely to be perceived accurately than those that give diverse images of the campaign (Noelle-Neumann 1973, Zaller 1992).

In addition, the recognition of political cues may be conditioned by the characteristics of the individual. Summing up a large research literature, Zaller (1992) formulated a "reception axiom," which suggests that levels of cognitive engagement are positively correlated with exposure to and comprehension of political stimuli (also see Neuman 1986). In other words, politically sophisticated individuals are more likely to perceive the partisan cues presented by various information sources, including their daily newspaper and daily television news program. Zaller presented impressive inferential tests of the reception axiom but never directly compared voter perceptions and the content of their information sources. As noted earlier, other scholars have questioned this axiom (e.g., Weaver 1980).

Research suggests contrasting expectations as to how individual predispositions affect recognition of (and receptivity to) political cues. Social learning theory assumes that people project their own preferences onto external information sources. For instance, unless the message is clearly dissonant, individuals tend to perceive others as holding political views similar to their own (Niemi 1974). Similarly, Wolfgang Donsbach (1990) has used cognitive dissonance theory to argue that media perceptions may reflect a person's preferences.

In contrast, Robert Vallone and his colleagues (1981, 1985) posit that a hostile media effect evokes just the opposite reaction. They found that people with strong political beliefs perceive the media as opposing their views, especially a media that attempts to present a balanced picture of the matter. Paul Beck (1991) replicated their analyses for a subset of Ohio newspapers in 1988. He found that partisans, if they saw any bias, were likely to see their daily newspaper as leaning toward the opposing candidate. This held even when Democrats and Republicans were evaluating the same newspaper.

To examine the linkage among newspaper content,

voter perceptions, and the above research hypotheses, we merged the aggregate newspaper data with the public opinion survey. Among those respondents who regularly read a newspaper, approximately 83% listed one of the papers in our content analysis study as their primary newspaper. For each reader of a specific newspaper, we created two new variables that measured whether the news and editorial content of the paper leaned toward either Bush or Clinton.¹⁶

We began by determining whether readers could accurately assess the partisan content of their daily newspaper. There is a surprising lack of statistical relationship between the actual news content of a newspaper and reader perceptions of its political leanings. The simple correlation between these two measures based on regular newspaper readers was only .09.¹⁷ Reader perceptions of a paper's political leanings were only slightly more related to a newspaper's editorial content ($r = .11$).¹⁸ Even endorsements of a presidential candidate were only modestly correlated with public perceptions of the partisan leanings of these papers ($r = .13$).¹⁹ People judged a newspaper's bias a bit more from what was on the editorial pages than from its news coverage (even though we found that the evaluative content of editorials and news articles is relatively independent). The weakness of these relationships, however, indicates considerable slippage between the objective content of a newspaper and the message perceived by its readers. There were significant differences in evaluative content among the newspapers in our sample (see figures 1 and 2), but such differences were not clearly perceived by readers.

As noted above, one factor that may affect the accuracy of perceptions is the clarity of the political

TABLE 3. Perceived Candidate Leaning of Newspapers by the Variance in Content

	Sample	Variance in Evaluative Content		
		Low	Modest	High
Editorials	.11*	.22*	.13*	.02
News reports	.09*	.14*	.01	-.01

Note: Table entries are Pearson correlation coefficients between the evaluative content of editorials and news coverage and reader perceptions of the candidate leaning of their daily newspaper. The variance in evaluative content was measured by the standard deviation in editorial or news content for each paper.

* $p \leq .05$.

signal sent by the press. We tested this idea for both news reports and editorials. For each newspapers we computed the standard deviation of evaluation scores in news reports and editorials on the campaign.²⁰ Table 3 indicates that newspapers with a more consistent partisan message (lower standard deviations in their evaluation scores) are more accurately perceived by their readers. For instance, there is a .22 correlation between editorial material and reader perceptions for newspapers with lower variance, and a .02 correlation for the newspapers with the most diverse messages. Thus, the clarity of the partisan signal affects the accuracy of its reception.

Personal characteristics also may affect perceptions of media content. Therefore, we expanded our model to examine the effect of partisanship and political attention on these relationships. The first column in Table 4 models readers' perceptions of the partisan leanings of their daily newspaper using three predictors: the content of editorials, the content of news reports, and the respondent's party identification. The direct effects of media content remained essentially unchanged. In addition, we found clear evidence of the hostile media effect as a function of party identification.²¹ Overall, these effects were the strongest in the model ($\beta = -.14$). People with strong attachments to the Republican Party were more likely to see their paper as leaning toward Clinton, independent of the paper's actual coverage. Similarly, people with strong Democratic identifications were likely to see their

¹⁶ We calculated the difference in the evaluative content of articles on the Bush and Clinton campaigns, derived from the data in figures 1 and 2. This was done for both news articles and editorials. This yields two variables that measure the relative evaluative content toward both campaigns, similar to the survey question which asks respondents to make these judgments. We did not include Perot because a statistically insufficient number of people felt their newspaper leaned toward Perot.

¹⁷ We were concerned that the simple summation of news articles across the full campaign might not produce an accurate measure of each newspaper's partisan content, which would lead to weak correlations. Therefore, we created a new measure that focuses on news articles with the following characteristics: (1) published in October and November, (2) appeared in the first news section of the paper or in a special election news section, and (3) weighted by size; that is, large articles (in column inches, without any continuation pages) received more weight than short articles. This recalculated measure was strongly related to the original measure presented in the text ($r = .87$), and the correlation with reader perceptions was identical to the statistic presented in the text (.09).

¹⁸ The larger correlation for editorial content is partially a function of the greater variance of this measure. In contrast, the unstandardized regression coefficients indicate that news reporting ($b = .12$) had a stronger effect on perceived evaluative content than did editorial content ($b = .08$). See Table 4 below.

¹⁹ This weak correlation may be surprising, because we all know of specific papers whose editorial leanings seem obvious to all (or at least to all media analysts). We attribute this weak relationship to several factors. More than two-thirds of the newspapers in our sample did not formally endorse either presidential candidate, which attenuates any possible relationship. In addition, we believe the multiple messages that newspapers project blur the clarity of their partisan cues.

²⁰ We would like to thank an anonymous reviewer for suggesting these analyses. We computed the difference between evaluative scores for the Bush and Clinton campaign in news reports that covered both, and we then computed the standard deviation for these difference scores in each newspaper. These standard deviations were used to categorize newspapers in Table 3. For editorials, we selected newspapers that had a standard deviation less than 1.25 or greater than 2.50 as the low/high categories; for news articles we selected newspapers with a standard deviation less than 1.25 and greater than 2.00.

²¹ For comparability with the other countries in the Cross-national Election Project, we used a version of the party identification question derived from the German election studies. Respondents were asked: "Many people lean toward a particular political party for a long time, although they may occasionally vote for a different party. Do you generally lean toward a particular party? (If independent): If you had to choose, do you think of yourself as closer to the Republican or the Democratic party? (If a partisan): Taken altogether, how strongly or weakly do you lean toward the [respondent's] party?"

Pairwise deletion of missing data was used in all regressions.

* $p \leq .05$.

newspaper as leaning toward Bush. This holds even when individuals were judging the same newspaper. Since partisans see the generally moderate political stance of the media as leaning away from their own more partisan political views, that may explain why the media are repeatedly and simultaneously attacked by critics on the Left and Right for their political bias.

We extended our analyses to test Zaller's reception axiom. One question in the survey asked newspaper readers how much attention they generally pay to newspaper articles about the presidential campaign. The last three columns in Table 4 analyze perceptions of the press while controlling for attention level.²² The most striking pattern is the strengthening of the hostile media effect for partisanship at lower levels of political attentiveness. Less attentive voters are much more likely to project their partisan biases onto the press ($\beta = -.26$); for them, the media is an advocate for the opposition, and objective media content was not significantly related to their perceptions. In a limited sense, Zaller's reception axiom is supported. The least accurate perceptions were found among those who did not pay attention to newspaper coverage. Yet, these relationships were only slightly stronger among the most attentive (they were strongest among the middle group).

These results seem to challenge the claim that the press exercises a persuasive influence on the American public. It would be difficult for a newspaper to influence the specific policy opinions of its readers if even the messages on a highly visible presidential election are not clearly perceived. A persuasive message must be sent and received, and our analyses of partisan cues in the 1992 campaign provide ambiguous evidence on

both points. Furthermore, the evidence in support of the hostile media hypothesis suggests why the press may receive such widespread criticism. Whether on the Left or Right, partisans see the balanced and objective press as leaning toward their opponent. Moreover, these feelings are strongest among those least attuned to the campaign, who perceive the media as hostile toward their preferred candidate.

MEDIA CONTENT AND CANDIDATE PREFERENCES

The information flow that begins with the presidential campaign and the media's coverage ultimately ends in individual decisions about a candidate. As we have seen, however, the connection between the beginning and end of this information flow is complex and often imprecise. First, newspapers project multiple messages about the campaign, so the political cues lack strength and clarity. Second, perceptions of the messages are as much a function of an individual's partisan leanings as of the message itself. Third, we come to the question of how the objective message and subjective perceptions influence partisan preferences.

To assess possible media effects in 1992, we linked our measures of press content to voters' feelings about the two major candidates.²³ We began with our two

²² The literature is divided on whether to measure media attentiveness through exposure (such as the frequency of readership) or attentiveness to specific topics (Biocca 1988, Chaffee and Schleuder 1986). We chose the latter because it enables us to focus on those who claim to use the media as an information source. The question wording was: "During the election campaign, how much attention did you generally pay to newspaper articles about the presidential campaign? Did you pay: a lot, some, a little, or no attention?"

²³ We measured candidate image with the following question: "I'd like to get your feelings toward the major candidates for president by asking you to rate each one on a scale that runs from 0 to 10. Zero means you feel most unfavorable toward the candidate, 10 means you feel most favorable toward the candidate, and 5 means you feel neutral toward the candidate. Using any number from 0 to 10, overall how unfavorable or favorable do you feel toward Bush?"

We used candidate image for several reasons. Vote choice is a simple dichotomy, which produces potential problems of estimating a dependent variable. In addition, the three-candidate race in 1992 complicated the analysis of vote preference and would force us to exclude Perot voters from the analysis. Therefore, we computed the difference between respondent evaluations of Bush and Clinton on the ten-point feeling scale. This difference measure (positive values represent support for Clinton) is the dependent variable for our analyses.

TABLE 5. Predicting Candidate Preferences in 1992

* $p \leq .05$.

objective measures of the content of the respondent's main daily newspaper: the relative favorability of news reports and editorial material (editorials and op/ed columns) toward the Bush and Clinton campaigns. We also included the respondent's perception of the candidate leanings of their newspaper to see if perceptions mediated the effect of the paper's evaluative content.

In addition, we wanted to control for the possibility that the correlation between content and party preferences is a function of predispositions or other spurious factors. We have discussed how predispositions may influence both awareness of messages and their persuasive influence. One potential source of these effects is the party identification of the respondent. Partisans may selectively perceive the political world and may be less influenced by information that supports competing points of view. Another source of spuriousness may arise from the local political context. If newspapers try to reflect the local standings of the candidates or their readers' preferences in reporting the news, then a correlation between media content and candidate preferences would be spurious. To control for these effects, we included both partisanship and county voting patterns as control variables.²⁴

As expected, party identification had a very strong influence on candidate image in 1992 ($\beta = .38$), shown in Table 5. In addition, the political cues provided in editorials had a significant positive effect ($\beta = .08$) on candidate image even while controlling for partisanship. It appears that voters used editorials as a reference point in making their electoral decisions. Some readers who saw the editorial content of their paper leaning toward Clinton apparently factored this into the candidate choice, just as they might weigh the partisan cues provided by other information intermediaries. Indeed, these editorial cues may have had

special force in 1992; the Clinton candidacy did especially well if we assume that most newspapers normally favor Republicans and incumbents. For instance, when the strongly conservative *Orange County Register* openly asked whether Bush should have run for reelection, this sent a clear political signal of the candidate's weakness.

The regression coefficients for media effects admittedly appear quite modest, which could be viewed as justification for the "minimum effects" interpretation of the media. One should recognize, however, that even a modest effect can have significant electoral consequences when the range of editorial content is substantial.²⁵ Figure 4 displays the relationship between editorials and candidate preferences derived from the unstandardized, total sample equation in Table 5. The center line presents the relationship for the total sample; to place this in context, we also chart the relationship for Democratic and Republican identifiers. A small relationship can produce large differences. For instance, the Clinton/Bush difference in editorial content of the *Detroit News* was relatively favorable toward Bush (-1.97), and the editorial pages of the *Detroit Free Press* were more positive toward Clinton (.46). Using these two papers as an example, the differences in their editorial content could produce a .65 point shift in the mean candidate images (on a ± 9 scale) among their respective readers, which is roughly the effect of partisan differences between In-

²⁵ In addition, research by Bartels (1993) on the effect of measurement error also applies to our analyses. The imperfect reliability of the media content measure should attenuate media effects. When coupled with measurement error in the survey-based variables, the "true" influence of the media would be substantially larger. Because data are unavailable to estimate these measurement effects empirically, their precise influence can only be surmised.

²⁴ County vote is Clinton's percentage of the vote in the three-way race.

dependents and Republicans.²⁶ Most newspapers did not display this magnitude of difference in their political cues, but when distinct political cues exist, they can influence political images. Even compared to the large effects for partisanship, these media effects are more than minimal.

The variables that do not exert an influence in Table 5 are also interesting. The political cues in news reports about the campaign did not have a significant independent effect on candidate images. We attribute this to the weak and multiple messages that flow from news reports on the campaign. To the extent that the American media try to be balanced and objective in reporting election news, the effects *should* be weak. In addition, perceptions of a newspaper's partisan leanings have no influence on candidate images once partisanship and the objective content of the press are controlled. Again, this suggests that media perceptions are largely a projection of political values (in this case partisanship) and thus have little independent influence on political opinions.

Beyond these overall analyses, we wanted to test our hypotheses that characteristics of the message (the clarity of the signal) and characteristics of the individual (the attentiveness to the media) may affect the cue-giving influence of the media. We first tested the hypothesis that editorial content will have a stronger effect when cues are distinct as opposed to diverse.²⁷ The second panel of Table 5 repeats the basic model while controlling for the variation in a paper's editorial content. In each submodel the effects of partisanship were dominant; when media cues were most variable, partisanship and voter perceptions of media cues were at their strongest (column three). Editorial cues were strongest for readers of papers with more consistent partisan cues ($b = .55$) than for newspapers whose party cues were highly variable ($b = .29$). Due to small subsamples and small effects, the differences between these two coefficients were not statistically significant.

The influence of media cues also may be a function

²⁶ For the interested reader, we present below the comparable multiple regression analysis to Table 5, using dichotomous vote choice (excluding Perot voters and nonvoters) as the dependent variable.

	β	b	Standard error
Editorials	.10*	.05*	(.02)
News reports	.06	.06	(.02)
Party identification	.73*	.14*	(.01)
Perception	-.04	-.03	(.02)
County vote	.02	.00	(.00)
Constant	—	1.27	
Multiple R	.76		
(Minimum N)	(561)		

* $p \leq .05$.

The effect of editorial content is slightly stronger when predicting vote choice. If the difference in editorial content of the *Detroit Free Press* and *Detroit News* were linked to vote choice, then this would represent a 12% difference in predicted vote.

²⁷ We focused on the clarity of editorial rather than news reporting cues because editorial cues are empirically more important in structuring candidate images. The operationalization of the variation measure uses the same procedures as for Table 3.

FIGURE 4. The Relationship between Editorial Content and Candidate Preference

Note: This figure plots the relationship between editorial content and predicted candidate support based on the total sample equation in Table 5.

of an individual's attention to the media. The last panel in Table 5 controls for the level of media attentiveness. The effect of partisanship was systematically related to attentiveness; the most attentive display the strongest partisan effects. There was also a tendency for editorial effects to be stronger among the moderate ($b = .35$) and highly attentive ($b = .13$) and weakest among the least attentive (.03), but this pattern was neither monotonic nor strong. In addition, news report content, perceptions of the newspaper's leaning, and county voting all lacked a significant relationship with candidate images. Attentiveness has only a modest influence on media effects.

THE MEDIA AND AMERICAN ELECTIONS

Our research provides a unique perspective not only on the media's role in national election campaigns but also on the persuasive effects the press may exercise by providing evaluative cues about the candidates to voters. We were not concerned with potential cognitive effects of the press, such as through priming or agenda setting, although these are important aspects to study. In 1992 the content of the evaluative information in the press was predominately critical of Bush and more flattering to Clinton, although we attribute this largely to the content and dynamics of the campaigns and less to any conscious media bias. Media coverage of the 1992 campaign primarily reflected the failures of the Bush campaign, which the media did not create.

Beyond the sum of political information provided by all media in 1992, we found that newspaper readers were exposed to a diversity of political messages from the press. The average newspaper presented a mixture of positive and negative news about each campaign. Moreover, we uncovered a surprising independence in political content between news reports and editorial assessments of the campaigns. Contemporary journalistic norms encourage such diversity of views and

moderation in overall political content; the days of a highly partisan American press are past. In summary, the press did not speak with a single clear voice in 1992, but with several voices and in muted tones.

The attempt of most newspapers to be fair in their coverage of the campaign ironically may explain why the media have received so much criticism from both partisan camps and why this is likely to continue. We found clear evidence that adherents of a political party tend to perceive their daily newspaper as leaning toward the other party—regardless of the paper's actual stance—even though most readers perceive their paper as relatively unbiased. This hostile media effect means that many partisans see balanced treatment of the candidates as bias toward the other side.

At the end of this process, the partisan cues provided by the press had a modest independent effect on candidate preferences. The content of editorials directly influenced candidate preferences; for example, newspapers that favored Bush on their editorial pages slightly increased support for Bush among their readers. Significantly, the effect was found for editorial content, which delivered partisan messages that were strongest and clearest, and not for news reports on the campaign. But the effect was modest, perhaps because even the editorial page sends multiple messages.

These results have several implications for the role of the modern press in democracy. The separation of news and editorial content and the diversity of information provided speak very positively about how the American press performs its role as a provider of information. The typical American voter has access to a large amount of material and a diverse set of political viewpoints through the local newspaper. Added to this is the information available from television, social groups, friends, and other intermediaries. Certainly, the wealth of information readily available to the average American voter now far exceeds the experience of previous generations.

The evidence that newspaper content can shift public images of the presidential candidate also suggests that the press performs a persuasive role as well as an information function. More than just framing events, the press provides political cues that may significantly influence the opinions of readers. Still, we stop short of interpreting these effects as completely attributable to the media. Even on the editorial pages, the press is analyzing campaign events that may vary in emphasis across locales because of interest in issues and partisan context differ. In other words, we find evidence of information effects, but it is not clear whether this is the media's independent influence or the effect of the campaign as transmitted by the press. The existence of these relationships, however, should revive interest in the potential persuasive power of the media.

The evidence in support of the hostile media hypothesis also may explain why it seems nearly everyone agrees that the media is biased—they just disagree on the direction of this bias. Partisans appear more sensitive to dissonant information in the media than they are to information that reflects their views. This makes the media unique in comparison to other information

sources, such as personal discussants and social groups, which individuals see as reinforcing their own beliefs. It is likely that these effects have strengthened in recent decades, since most cities are now served by a single newspaper that gravitates to a neutral political position. The hostile media effect presents a special challenge for newspapers and television. It is possible for the media to be both more neutral in their reporting of events and increasingly criticized by partisans for their (perceived) bias. Thus, the media's continuing credibility depends on providing balanced coverage of the news, yet still retaining the confidence of a possibly skeptical readership.

Finally, the public's limited ability to perceive accurately the partisan cues of the press and the limited influence of these cues on candidate images may reflect the basic nature of the press's message. The information flow through the press conforms to what Zaller would describe as a "multiple message" medium. Multiple and often conflicting messages necessarily diminish the potential persuasiveness of this information flow, especially in comparison to the more partisan press in other democracies. The strongest evidence supporting this conclusion comes from findings about the editorial pages, where explicit political cues are more apparent than in news reports and are more accurately perceived by readers. Ironically, as the American press has become more professionalized and has moved closer to the ideals of information providers in a democracy, its persuasive influence on voter preferences has probably diminished.

APPENDIX

We conducted a national telephone survey using the CATI (computer assisted telephone interviewing) facilities of the Center for Survey Research at Indiana University. We selected counties as our primary sampling units. All the counties in the United States were stratified by population size, education, and change in population since the prior Census; this produced 20 strata that each contained 5% of the population. A replicate design was employed in which two counties were independently chosen from each cell with replacement. Los Angeles County was randomly selected in both samples, so there were actually 39 different counties.

The telephone list was provided by Survey Sampling using random-digit dialing procedures. Within each household, residents were listed by age, and then a respondent was randomly selected. Extensive callbacks were made. The survey yielded a random sample of 1,318 voters, plus a supplemental sample of 271 spouses and 841 personal discussants for these main respondents (see Huckfeldt et al. 1995). This total *N* produced approximately 33 respondents per county; the number seems small, but it provides a reasonable basis for estimating sample statistics for counties (rather than individual results for specific counties).

The interviews averaged a bit more than an hour; they began during the week after the election and were completed by the end of January. The response rate was 48%, calculated as the ratio of completions to the sum of completions, refusals, and partial completions. Alternatively, if we include subjects who were never available after multiple callbacks, the response rate is 45%. There is a sampling bias in the

direction of the politically active; the sample overestimates voter turnout in comparison to Census figures. The vote shares average within 1.6% of the official vote totals, however, which is more accurate than the NES postelection sample. Our sample was more educated than the national adult population (though less than the population of voters), as is typical of telephone surveys. It roughly matches the population in gender and racial distribution. The survey is deposited with the Inter-university Consortium for Political and Social Research in Ann Arbor (Beck et al. 1995).

For each of these counties, we collected the major local newspaper, a list of which is presented in Table A-1. For each newspaper we coded every third day during this period and every Sunday; a maximum of 27 days were coded for each

paper, depending on its circulation pattern. For each sampled day we coded all articles that dealt with the campaign in the first half of the news section. In addition, we coded any articles that appeared under a separate election or campaign heading later in the news section; we also coded all campaign articles that appeared on the editorial pages. A total of 6,537 separate articles were coded.

Minority Representation in Multimember Districts

ELISABETH R. GERBER *University of California, San Diego*

REBECCA B. MORTON *University of Iowa*

THOMAS A. RIETZ *University of Iowa*

Given the recent court rulings against racial gerrymandering, the effect of multimember district elections on minority representation is an important issue. We present a model of voting in double-member district elections with two majority candidates and one minority candidate and consider the voting equilibria under straight and cumulative voting. In straight voting, while an equilibrium always exists in which the two majority candidates are expected to win the two seats, minority candidates may be elected. In cumulative voting, minority candidate wins are also possible in equilibrium but are less likely when minority voters prefer one majority candidate over another. We then present experimental evidence showing that minority candidates win significantly more seats in cumulative than in straight voting elections. When minority voters perceive a substantial difference between the majority candidates, however, they are more likely to split their votes between the minority and majority candidates, winning fewer seats.

A fundamental issue in modern democracies is the extent to which the electoral system facilitates representation of multiple interests. In particular, the degree to which the diversity of both the interests and the characteristics of the electorate are "represented" by its legislators is a basic concern when choosing or evaluating electoral rules. Political scientists distinguish between two forms of representation. *Descriptive representation* refers to the demographic characteristics of the electorate, while *substantive representation* refers to the policy interests of the electorate (Pitkin 1967, Swain 1993). Although many commentators argue that the latter is most important, the two forms of representation are linked in significant ways. In particular, if features of the political system prevent one demographic group from achieving descriptive representation, then it may be highly unlikely that the group will be able to achieve substantive representation of its interests. Thus, the effect of electoral rules and other political institutions on both the characteristics and the policy positions of elected officials cannot be ignored.

Since the passage of the 1965 Voting Rights Act, scholars and practitioners in the United States have debated how to achieve representation—both descriptive and substantive—of racial and ethnic minorities. Early court cases and electoral reforms before and shortly after the Voting Rights Act concentrated on

increasing minority voter participation through removing barriers to registration and access to the ballot. Empirical evidence shows that these efforts successfully increased minority registration and voting rates.¹

Nevertheless, the number of minorities elected to federal, state, and local legislatures remains far lower than the minority portion of the population might warrant. African Americans and Latinos comprised 21.1% of the American voting-age population in 1996, but only 10.6% of the members of Congress elected that year were from these groups, and similar discrepancies persist in state and local legislatures. Beginning with the Supreme Court decision in *Allen v. State Board of Education* 1969, reform efforts shifted from increasing participation to removing other barriers to minority representation. In *Allen*, the Court argued that the preclearance provisions in Section 5 of the Voting Rights Act should also apply to factors which might "dilute" the force of minority votes that were appropriately cast and counted. Most subsequent debates and court cases have focused on how electoral systems dilute or enhance minority voting strength and representation even after the Voting Rights Act removed barriers to minority participation.

One area of particular concern in these debates has been the ability of minority voters to achieve representation in legislative bodies. The primary focus is on how electoral laws and procedures affect the ability of minority voters to elect minority candidates. In the United States, members of Congress are chosen in single-member district elections.² Members of local

Elisabeth R. Gerber is Assistant Professor, Department of Political Science, University of California, San Diego, La Jolla, CA 92093-0521. Rebecca B. Morton is Associate Professor, Department of Political Science, University of Iowa, Iowa City, IA 52242. Thomas A. Rietz is Associate Professor, Department of Finance, University of Iowa, Iowa City, IA 52242.

Earlier versions of this article were presented at the 1995 annual meetings of the Public Choice Society; the 1997 Political Methodology summer meetings; and the 1997 annual meeting of the American Political Science Association. The Office of the Vice President for Research at the University of Iowa provided funding for the experiments. We thank Greg Adams, Chris Fastnow, Kristin Kanthak, and Dena Levy for their assistance with the experiments. We also acknowledge the helpful comments and suggestions of Chris Achen, Gary Cox, Mark Fey, Dean Lacy, and Samuel Merrill. All remaining errors are, of course, the authors' responsibility.

¹ By 1967 minority voter registration rates had risen more than 50% in all the states covered by the 1965 Voting Rights Act (see Grofman, Handley, and Niemi 1992). Filer, Kenny, and Morton (1991) show that by 1980, after controlling for demographic and other relevant variables, minority turnout rates in presidential elections had become roughly equivalent to those of nonminority voters.

² This has not always been the case. As Cox (1984) notes, the use of multimember districts stems from our English heritage: "The modal type of district in England from the thirteenth through most of the nineteenth century was double-member, with the next most common types being single- and triple-member. Early records from the colonies indicate that representatives to colonial legislatures were returned from the same mix of districts, although there was a

and state legislatures are typically chosen in single-member or multimember district elections.³ Both types of elections are generally "winner-take-all," that is, the top vote receiver (in single-member districts) or the top x vote receivers (in districts with x members elected) are chosen. In some cases the winner must also secure a majority of the votes cast or face the closest opponent(s) in a runoff election.⁴ The standard procedure used in most U.S. elections—both single-member and multimember—is straight voting. Each voter has one vote per office and can cast up to one vote per candidate. In a single-member district election, then, each voter can cast one vote for a single candidate or abstain. In a double-member district election, each voter can cast one vote for each of two candidates, one vote for only one candidate, or abstain.

Many in the scholarly and legal communities argue that, under straight voting, single-member districts allow minority voters to elect minority representatives more easily than do multimember districts. To support this argument, proponents point to the following example. Consider a double-member district election under straight voting. Suppose one candidate supported by a nonwhite minority of voters in the district faces two candidates supported by the white majority bloc. Each voter has two votes. If voting is sincere and strictly racial, then we would expect whites to split their votes between the white candidates and nonwhites to cast only one vote for the nonwhite candidate.⁵ The two white candidates will receive the most votes (i.e., they will tie), and the minority candidate will come in third. If instead the district is divided into two single-member districts, such that one has a majority of nonwhite voters, and voters again vote along racial lines, then the minority candidate will be elected. By this logic, minority votes are less diluted in single-member districts than in multimember districts.

In addition to hypothetical examples, proponents of single-member districts point to empirical evidence showing that local governments in the post-Reconstruction South moved to multimember districts in order to dilute African-American voting strength (see Kousser 1992). For the voting population in 1988, Welch (1990) demonstrates that a gap exists between the number of minorities elected under at-large districts versus single-member districts. Similarly, two

candidates from one party may "squeeze out" a candidate from a minority party in double-member district elections. Citing evidence from multimember district elections in Michigan, Ohio, and England, Cox (1984) reports that the empirical evidence of such domination is mixed.

While multimember districts have not been declared unconstitutional per se, Section 2 of the 1982 Amendments to the Voting Rights Act does allow for challenges to these systems if they "result in the denial or abridgment of the right of any citizen on the grounds of one's race or membership in certain language minorities" (Bott 1990, 207). Furthermore, many of the court cases since *Allen* have concerned the extent to which multimember districts dilute minority voting strength at the state and local levels. As Justice Thomas points out in his concurrence in *Holder v. Hall* (1994, 7):

Perhaps the most prominent feature of the philosophy that has emerged in vote dilution decisions since *Allen* has been the Court's preference for single-member districting schemes, both as a benchmark for measuring undiluted minority voting strength and as a remedial mechanism for guaranteeing minorities undiluted voting power. See, e. g., *Grove v. Emison*, 507 U.S. ___, __ (1993) (slip op., at 14); *Gingles*, *supra*, at 50, n. 17 (declaring that the "single-member district is generally the appropriate standard against which to measure minority group potential to elect"); *Mobile v. Bolden*, 446 U.S. 55, 66, n. 12 (1980) (plurality opinion) (noting that single-member districts should be preferred in court-ordered remedial schemes); *Connor v. Finch*, 431 U.S. 407, 415 (1977) (same). Indeed, commentators surveying the history of voting rights litigation have concluded that it has been the objective of voting rights plaintiffs to use the Act to attack multi-member districting schemes and to replace them with single-member districting systems drawn with majority-minority districts to ensure minority control of seats. . . . The obvious advantage the Court has perceived in single-member districts, of course, is their tendency to enhance the ability of any numerical minority in the electorate to gain control of seats in a representative body. See *Gingles*, 478 U.S., at 5051.⁶

Recent developments raise serious questions about the extent to which districting can be used to promote minority representation, particularly at the federal level. In congressional redistricting following the 1990 Census, a number of states, including Florida, Georgia, Louisiana, North Carolina, and Texas, engaged in deliberate racial gerrymandering. These plans linked geographically dispersed groups of voters by race in order to maximize the number of districts in which minorities comprise a majority of the electorate. A number of new minority representatives were elected from these districts, but the gerrymandering was subsequently challenged and in several cases overturned. The Supreme Court ruled that these districts violated

tendency also to use larger multi-member districts" (pp. 724–5). Reflecting this mixed heritage, the U.S. Constitution was silent on whether congressional delegations should be elected on a general ticket from each state as a whole or under a districting scheme and left that matter to be resolved by the states or by Congress. Not until 1842 did Congress decide that representatives should be elected from single-member districts (Congressional Act of June 25, 1842, Chapter 47, 5, Stat. 491). U.S. senators are elected from double-member districts with staggered elections.

³ For figures on the use of multimember districts in the United States, see Cox 1984, Jewell 1970, and Klain 1955.

⁴ See Gerber, Morton, and Rietz 1996 for a discussion of majority requirements.

⁵ Recall that under straight voting, voters cannot cumulate their votes for a single candidate. The assumption of sincere and strictly racial voting is critical for this example. In our theoretical and experimental analyses in this paper, we consider the consequences of strategic voting under straight and cumulative voting.

⁶ In *Holder v. Hall* (1994) the Supreme Court ruled against plaintiffs who wished to replace a single elected local administrator with a five-member board elected from single-member districts, which suggests that the Court's bias against multimember districts may be decreasing. Note that the full references for *Grove v. Emison* were not available at the time Justice Thomas wrote his opinion. The complete citation is *Grove v. Emison*, 507 U.S. 25, 37–42 (1993).

the constitutional rights of white voters by using race as the predominant factor in drawing district lines.⁷

Racial gerrymandering raises a number of issues. Many researchers have begun to recognize its limits as a means of increasing minority representation since it depends on residence choices of minority and majority voters. In fact, it may actually encourage residential racial segregation. Moreover, racial gerrymandering can significantly change the ideological composition of voters in other districts. For example, by concentrating racial and ethnic minorities into one or a few districts, the remaining (majority) districts lack ideologically liberal minority voters and therefore may elect more conservative representatives (see Grofman and Davidson 1992; Cameron, Epstein, and O'Halloran 1996). For all these reasons, racial gerrymandering is clearly limited as a method for enhancing the ability of voters to elect members of Congress who represent both the characteristics and the interests of minority and majority voters.

With multimember districts seen as potentially vote diluting and racial gerrymandering viewed as equally problematic, attaining the goal of increased minority representation seems impossible, short of proportional representation. Yet, a considerably less radical alternative than this is advocated by Guinier (1994): "cumulative" voting in multimember districts. For example, in a double-member district under cumulative voting, voters can cast their two votes as follows: twice for one candidate, once each for two candidates, once for one candidate only, or abstain. All voters have the same number of votes as in the straight voting case (two in this example), but they have more options as to how they can distribute their votes among the candidates.⁸

Proponents argue that cumulative voting is an effective and equitable method of achieving minority representation. "Like-minded voters can vote as a solid bloc or, instead, form strategic cross-racial coalitions to gain mutual benefits" (Guinier 1994, 14). Specifically, minority groups can cast racially motivated votes, cumulating them on one minority candidate, while white voters split their votes between two or more white candidates. Alternatively, nonwhite voters can form coalitions with white voters if they desire. Thus, without relying on racial gerrymandering or proportional representation, cumulative voting allows minority voters to maximize their representation, either descriptive or substantive, depending upon their unique political circumstances.⁹

Most claims about the effects of cumulative voting are purely speculative, since the procedure is rarely used, and studies of its theoretical effects are even more rare. There are a few exceptions, most notably

the work of Merrill (1981) and Cox (1984), discussed below. Some corporations currently use cumulative voting to elect members to their boards of directors. Several small municipal and county governments in the United States also use cumulative voting, as did the State of Illinois before 1982.¹⁰

Cumulative voting coupled with multimember districts thus represents a potential means for increasing minority representation in legislatures such as the U.S. Congress. Hence, it is important to evaluate carefully the merits of this voting system to identify the conditions under which it indeed increases the likelihood of minority candidates winning office. In this article we examine theoretically and empirically both cumulative voting and straight voting in multimember district elections. Previous theoretical analyses have approached parts of this issue. A number of researchers have examined optimal voter strategies under numerous voting procedures using a decision-theoretic approach. One example is Merrill (1981), who found that, in multimember elections, cumulating for one candidate is an undominated strategy.¹¹ Cox (1984) considered voting strategies under straight voting and showed that it may be optimal in double-member district elections for voters to "plump" their votes by voting for only one candidate (their favorite) rather than for two candidates.¹² Yet, neither researcher derives equilibrium outcomes and the full slate of equilibrium voting strategies for the different electoral systems, and neither explores the comparative statics of the equilibrium predictions. Instead, they focus strictly on the decision problem of the individual voter.

Other researchers have explored equilibrium outcomes under different electoral systems. Myerson and Weber (1993) and Saari (1994) present equilibrium analyses of straight and/or cumulative voting, but they examine only single-member elections. We show that the tendencies to plump votes in straight voting and to cumulate votes in cumulative voting are related directly to the conditional probabilities of which candidates, in the event of a tie, are likely to tie for the *last* seat rather than first place. Thus, the results from single-member district elections do not generalize to multimember district elections, since analyses of the former cannot reveal the full range of equilibrium possibilities in the latter.

Finally, Cox (1990, 1994) combines analyses of individual choice and equilibrium outcomes under several alternative electoral systems. Cox (1990) examines equilibrium candidate positions under cumulative voting but assumes that voters vote sincerely for their first

⁷ See, for example, *Shaw v. Reno* (1993) on the Florida districts, and *Bush v. Vera* (1996) on the Texas districts.

⁸ Since voters have only one vote in single-member district elections, cumulative voting and straight voting in single-member district elections are theoretically identical.

⁹ The effects of cumulative voting can be viewed as lowering the threshold of exclusion to minority representation when all voters cumulate for their most preferred candidates. See Rae 1971.

¹⁰ See Glazer, Glazer, and Grofman (1984) for an explanation of cumulative shareholder voting. Adams (1996) and Sawyer and MacRae (1962) analyze the Illinois system. Cole, Taebel, and Engstrom (1990) report on the use of cumulative voting in the City of Alamogordo, New Mexico, and Still (1990) discusses the application of cumulative voting in a number of Alabama county commissions and school boards.

¹¹ This result is consistent with the more general theoretical results we present below, although in some of the equilibria in our model, voters also may optimally mix between cumulating and splitting their votes.

¹² We also derive this result in our more general model.

preference and that policy is unidimensional. In our analysis, we allow for a multidimensional voting space and permit voters to behave strategically.¹³ Cox (1994) investigates strategic voting equilibria in single non-transferable vote (SNTV) systems, which resemble cumulative voting systems, but voters *must* cumulate all their votes on a single candidate. Thus, our results can be seen as an extension of both the early work of Merrill and Cox and the later equilibrium analyses of Cox, Myerson and Weber, and Saari.¹⁴

In the following section we present our theoretical model, which focuses on three-candidate elections in double-member districts.¹⁵ To capture the concept of minority candidates in our model, we assume a voter preference configuration such that a majority of voters prefer two of the candidates (i.e., the majority candidates) to the third, while a minority of voters prefer the third candidate (i.e., the minority candidate) as their first choice. We consider the voting equilibria in multimember districts under straight voting and then under cumulative voting. The next section presents experimental evidence on multimember district elections under both voting systems. The final section considers the implications of our analyses for minority representation in contemporary U.S. elections.

THEORETICAL ANALYSIS OF VOTING IN MULTIMEMBER DISTRICTS

Candidates, Voter Types, and Preference Distribution

We assume three candidates, D , R , and S , and three types of voters, d , r , and s , who most prefer the respective candidates. Type d and r voters next prefer candidates R and D , respectively. We normalize to 1 the utility a voter receives if her most preferred candidate wins a seat, 0 if her least preferred candidate wins. Type d voters are assumed to receive u_d utility if their second preference, R , wins a seat, $0 \leq u_d \leq 1$. Type r voters are assumed to receive u_r utility if their second preference, D , wins a seat, $0 \leq u_r \leq 1$. Type s voters are divided into two sets: s_R voters, whose second prefer-

TABLE 1. Generic Utility Schedule

Voter Type	D	R	S	% of Voters
d	1	u_d	0	n_d
r	u_r	1	0	n_r
s_D	u_{sD}	0	1	n_{sD}
s_R	0	u_{sR}	1	n_{sR}

$$1 - u_{si} > u_j$$

ence is R , and s_D voters, whose second preference is D . Type s_i voters receive u_{si} utility from their second preference, $0 \leq u_{si} \leq 1$. We also assume that $1 - u_{si} \geq u_j$. That is, the decrease in utility for minority voters from their second preference (either D or R) replacing their first preference (S) is greater than the gain in utility to majority voters for replacing their last preference (S) with their second preference (either D or R , respectively).

Table 1 presents a summary of the utility schedule. The utilities can be interpreted as follows. Types d and r are majority voters who are divided over which majority candidate, D or R , they prefer. The majority voters receive a high utility (normalized to 1) if their most preferred candidate wins, a lower positive utility if the other majority candidate wins, and the lowest utility (normalized to 0) if the minority candidate wins. We assume additive utility. Thus, since two candidates are elected, majority voters of type j receive a maximum utility of $1 + u_j$ if the two majority candidates win, a utility of 1 if their favorite majority candidate plus the minority candidate win, and a utility of u_j if the other majority candidate plus the minority candidate win.

The minority voters (type s) similarly receive a high utility if the minority candidate wins (normalized to 1) and the lowest utility (normalized to 0) if their least preferred majority candidate wins. Again, since two candidates are elected, minority voters of type s_i can receive a maximum of $1 + u_{si}$ if the minority candidate and their most preferred majority candidate win, a utility of 1 if the minority candidate and their least preferred majority candidate win, and a utility of u_{si} if the two majority candidates win. We also assume that the minority voters comprise a plurality of the electorate but not a majority. We normalize the total number of voters to 1. Thus, we assume that there are n_d , n_r , n_{sD} , and n_{sR} numbers of d , r , s_D , and s_R voters, respectively, such that $1/2 < n_d + n_r < 2/3$. We chose the three-candidate, double-member configuration because we felt it was the most empirically relevant (as noted by Cox 1984). Our configuration also allows us to test the argument, presented earlier, that multimember districts with straight voting are biased against the election of minority candidates.¹⁶

¹³ While we do not explicitly model the policy space of the candidate positions, our formulation allows straightforward translation of voter preference functions over candidates into an issue space of two or more dimensions.

¹⁴ Sawyer and MacRae (1962) present an early theoretical analysis of cumulative voting and an empirical investigation of cumulative voting in Illinois. Adams (1996) presents a more recent empirical analysis testing propositions about candidate positions based on the assumption of sincere voting. In both cases, voter behavior is "black boxed," and the theoretical analyses concern the parties' decisions in terms of number of candidates or location of policy positions. These researchers assume all voters cumulate for their most preferred candidates, which we show may not always be the equilibrium strategy for all voters.

¹⁵ Our choice of three-candidate elections is based on Cox's (1994) analysis, which shows that strategic voting in SNTV systems will lead to an equilibrium in which the number of candidates equals to one plus the number of seats in the district. A special case of cumulative voting, SNTV systems force voters to cumulate votes on one candidate. We later consider how expanding the number of candidates would affect the analysis.

¹⁶ An alternative configuration which yields similar results assumes that minority voters are less than a plurality but that a significant portion of majority voters have as their second preference the minority candidate.

Straight and Cumulative Voting Games

In each election under straight voting, a voter can either abstain or cast one vote each for up to two candidates. Hence, voters can cast one vote each for two, one, or zero candidates. Let (v_D, v_R, v_S) designate a voter's vote vector, where v_i equals the number of votes for candidate i . Then, in straight voting, voters are allowed to cast the following vote vectors: (1,1,0), (1,0,1), (0,1,1), (1,0,0), (0,1,0), (0,0,1), (0,0,0). In each election under cumulative voting, a voter can either abstain or cast up to two votes for any combination of candidates. Again, voters can cast one vote each for two, one, or zero candidates. They also can cumulate their two votes and cast them for a single candidate. In cumulative voting, voters are allowed to cast the following vote vectors: (2,0,0), (0,2,0), (0,0,2), (1,1,0), (1,0,1), (0,1,1), (1,0,0), (0,1,0), (0,0,1), (0,0,0).

In each election, the two candidates that receive the most votes are the winners. Voters receive the sum of utilities corresponding to the winning candidates and their voter type. If a tie for second place occurs between two or more candidates, we assume the winner(s) is selected randomly.

Voting Equilibria

We now present a characterization of the voting equilibria based on the model developed by Myerson and Weber (1993). A voter can affect the election outcome only if two or more candidates receive vote totals that are within one vote and would just qualify them for the last seat. A voter's vote may affect a close two-way race for the first seat, but his vote will not change his utility from the outcome, as both candidates would be elected regardless of how the close race for the first seat is resolved. How a voter perceives the likelihood of various "close races" for the last seat should therefore play a role in her vote choice. These perceptions may arise from a variety of sources, including uncertainty about electorate demographics, candidate positions, voter preferences for candidates, turnout level, and how other voters will vote given all available information. In the experiments we discuss later, we remove many of the sources of this uncertainty. We give all voters information on the number of voters of various "types." We show how each voter type ranks the candidates by showing the monetary payoffs each will receive conditional on each candidate winning. Yet, voters do not know the utility functions of other voters over these payoffs, the uncertainty they perceive, or how they will vote conditional on these factors. This preference and strategic uncertainty can create considerable doubt about the possible election outcome.

We define a near tie (for the last seat) as one in which the votes controlled by a single voter can affect the election outcome. In large elections, the probability of a tie for the last seat is generally extremely small. If voters believe that this probability is zero, then they are indifferent between all vote vectors, and voter behavior is predicted to be random. We therefore assume that

voters perceive the probability of a tie for the last seat is positive, albeit very tiny. We further assume:

1. Near-ties are perceived to be much more likely between two candidates than between three or more candidates.
2. The probability that a particular ballot moves one candidate past another for the last seat is perceived to be proportional to the difference in votes cast on the ballot for the two candidates.
3. Voters seek to maximize their expected utility gain from the outcome of the election.

The first assumption means that voters form subjective expectations about tie probabilities. They view three-way ties as sufficiently unlikely that they can disregard the possibility, which greatly simplifies their vote choices. This does not mean that voters compute the actual probabilities of a tie (see, e.g., Fey 1997, Ledyard 1984, Palfrey 1989); rather, they estimate it from their expectations about the electoral outcomes. In this sense our voting model, like that of Myerson and Weber (1993), does not fully specify the process through which voters form their perceptions of tie probabilities. The model would be complicated to the point of intractability if we were to endogenize voter perceptions assuming rational and strategic calculations of the cross-effects of all voter choices on their own choices and the probabilities.

The second assumption implies that voters recognize that casting the same number of votes for two candidates in a close race does nothing to their relative standing and, therefore, does not influence the election. Casting one more vote for the preferred of two candidates in a close race allows some probability of influencing the election in the direction preferred by the voter. Casting two more votes for this candidate further increases the probability of influencing the election as desired. This assumption states that voters believe the increase in probability is proportional to the increase in the vote difference they cast for the candidates. That is, a two-vote difference is twice as likely to affect the outcome as a one-vote difference.

Let $K = \{1, 2, \dots, k\}$ be the set of candidates and p_{ij} be the ij -pivot probability (perceived by a voter) of the event that candidates i and j will be tied for the second seat in an election. Then, given our three assumptions, a voter who assigns utility U_i to the election of candidate i and perceives the likelihood of a near-tie between candidates i and j to be p_{ij} will cast the vote vector $(v_1, \dots, v_k)$, which maximizes

$$\sum_{i \in K} \sum_{j \neq i} p_{ij}(U_i - U_j)(v_i - v_j) = \sum_{i \in K} v_i \sum_{j \neq i} p_{ij}(U_i - U_j). \quad (1)$$

As noted above, the perceived probability that two candidates are likely to tie for the last seat is very small. Following Myerson and Weber (1993), we can rescale the vector of perceived tie probabilities to make its components sum to one. In this fashion, the pivot probabilities become perceived "conditional" probabilities. That is, conditional on a tie for the last seat, these

FIGURE 1. Equilibria under Straight Voting with Minority Voter Preferences over D and R

rescaled probabilities are the perceived likelihood that the tie will be between candidates i and j . Voters rationally allocate their votes given these perceived conditional probabilities. At a *voting equilibrium*, the voters' perceptions of the relative chances of various close races support voting behavior that leads to an outcome justifying the original perceptions. Note that voters do not vote monolithically. Therefore, even though the distribution of types is fixed and known, as in Myerson and Weber (1993), voters choose vote vectors without knowing for certain the choices of the other voters, including voters of their own type. An equilibrium exists when their expectations about the electoral outcome are justified by the outcome.

Straight Voting Equilibria. In straight voting elections, voters have two undominated vote vectors: vote only for their most preferred candidate or vote for both their first and second preferences. For example, type s_D voters may maximize expected utility by casting vote vectors $(0,0,1)$ or $(1,0,1)$. Voting for their least preferred candidate, R , or abstaining is always dominated by voting either only for S or for both S and D .¹⁷ Intuitively, if a tie for second place seems likely, voters will vote just for their first preference when they perceive that candidate is most likely to tie with their second preference. They will vote for both when they perceive that their second preference is likely to tie for second with their third preference. Voters will mix

between these two strategies when the expected utilities from each vote vector are equal.

Figure 1 illustrates the possible voting equilibria under straight voting. The equilibria are presented as points in the two-simplex of the rescaled perceived conditional pivot probabilities for second-place ties, p_{RD} , p_{RS} , and p_{DS} . We know that $p_{RD} + p_{RS} + p_{DS} = 1$.¹⁸ At the left vertex $p_{RS} = 1$ and $p_{RD} = p_{DS} = 0$; at the top vertex $p_{RD} = 1$ and $p_{DS} = p_{RS} = 0$; and at the right vertex $p_{DS} = 1$ and $p_{RD} = p_{RS} = 0$. Along the left boundary of the simplex, $p_{RS} + p_{RD} = 1$ and $p_{DS} = 0$; along the right boundary of the simplex, $p_{DS} + p_{RD} = 1$ and $p_{RS} = 0$, and along the bottom edge of the simplex, $p_{RS} + p_{DS} = 1$ and $p_{RD} = 0$. At points inside the simplex all the conditional probabilities are positive. Thus, for example, as we move from the left vertex up and to the right, p_{RS} decreases, and p_{DS} and p_{RD} increase.

We can divide the simplex into nine regions according to the optimal voter strategies. In regions A, B, and D, type s_D voters perceive that a tie for second place between their second preference (D) and first preference (S) is less likely than a tie for second place between their second and third preference or between their first and third preference. That is, $p_{RS}, p_{RD} > p_{DS}$. Thus, in these regions type s_D voters vote for both their first and second preference, casting vote vector $(1,0,1)$.

¹⁷ Abstention is a dominated strategy since voting is costless.

¹⁸ We can represent the equilibria in this fashion since the voters' objective functions are homogeneous of degree 1 in the pivot probabilities.

TABLE 2. Vote Vectors (v_D, v_R, v_S) Consistent with the Straight Voting and Cumulative Voting Equilibria

Voter Types		Equilibrium Outcome under Straight Voting				
When $u_{sl} > 0$		$D \approx R \approx S$	$D \approx R \approx S$	$D \approx R \approx S$	$D \approx R \approx S$	$D \approx R \approx S$
d		(1,0,0)	(1,1,0)&(1,0,0)	(1,0,0)	(1,1,0)&(1,0,0)	(1,1,0)
r		(0,1,0)	(0,1,0)	(1,1,0)&(0,1,0)	(1,1,0)&(0,1,0)	(1,1,0)
s_D		(1,0,1)&(0,0,1)	(1,0,1)&(0,0,1)	(0,0,1)	(0,0,1)	(0,0,1)
s_R		(0,1,1)&(0,0,1)	(0,0,1)	(0,1,1)&(0,0,1)	(0,0,1)	(0,0,1)

d		(2,0,0)	(2,0,0)	(2,0,0)
r		(0,2,0)	(0,2,0)	(0,2,0)
s_D		(2,0,0)&(0,0,2)	(0,0,2)	(2,0,0)&(0,0,2)
s_R		(0,0,2)	(0,2,0)&(0,0,2)	(0,2,0)&(0,0,2)
When $u_{sl} = 0$			$S \gg D \approx R$	
d			(2,0,0)	
r			(0,2,0)	
s			(0,0,2)	

In regions C, E, F, G, H, and I, type s_D voters perceive a significant probability that their first and second preference will tie for second place if a tie occurs (i.e., p_{DS} has increased) and thus only vote for their first preference, casting vote vector (0,0,1). Along the boundary of these two sets of regions, voters of type s_D will mix between these two pure strategies. Where the boundary of this region touches the right edge, $p_{RD} = 1 - u_{sD}$, $p_{DS} = u_{sD}$, and $p_{RS} = 0$. Similarly, type s_R voters will cast vote vector (0,1,1) in regions A, C, and F; vote vector (0,0,1) in regions B, D, E, G, H, and I; and mix between these two pure strategies along the boundary between these two sets of regions, where $p_{RD} = 1 - u_{sR}$, $p_{RS} = u_{sR}$, and $p_{DS} = 0$. Type d voters will cast vote vector (1,0,0) in regions A, B, C, E, F, and H; vote vector (1,1,0) in regions D, G, and I; and mix along the boundary, where $p_{RD} = u_d$, $p_{RS} = 1 - u_d$, and $p_{DS} = 0$. Finally, type r voters will cast vote vector (0,1,0) in regions A, B, C, D, E, and G; vote vector (1,1,0) in regions F, H, and I; and mix along the boundary, where $p_{RD} = u_r$, $p_{DS} = 1 - u_r$, and $p_{RS} = 0$.

We can identify five possible equilibria in straight voting, labeled points 1, 2, 3, 4, and 5 in Figure 1 and summarized in Table 2. In the first four of these equilibria, at least two voter types use mixed voting strategies, mixing between voting solely for their first preference and voting for both their first and second preference. At point 1, s_D and s_R voters mix between voting for just their first preference and voting for both their first and second preference, while d and r voters vote only for their first preference. At point 2, s_D and d voters mix, while r and s_R voters vote only for their first preference. At point 3, s_R and r voters mix, while d and s_D voters vote only for their first preference. At point 4,

d and r voters mix, while s_D and s_R voters vote only for their first preference. In all four of these equilibria, voters place positive probabilities on all two-way close races for second place, and the equilibrium outcome is a close three-way race among the candidates. The notation $\approx$ represents a close race. Thus, in these four possible equilibria, the outcome is represented as $D \approx R \approx S$; that is, all three candidates are in a close race for first place, and a close race for second place can occur between any two of them. The pivot probabilities in these four equilibria are not all equal, however, and as $u_{si} \rightarrow 0$, then $p_{RD} \rightarrow 1$ in all four of these equilibria (i.e., the expectation is close to certainty that the minority candidate will win a seat, and any close race for the second seat will be between the two majority candidates). In the fifth and final equilibrium, all voters use pure strategies. Minority voters vote only for the minority candidate, and majority voters vote for both majority candidates; that is, the two majority candidates are in a close race for first, and the minority candidate is expected to receive the fewest votes. Thus, any close race for second place will be between the minority candidate and one of the majority candidates but not between the two majority candidates. The expected equilibrium outcome is represented as $D \approx R \gg S$, where $\gg$ represents a strict ranking.

The location and likelihood of these equilibria depend on assumptions about the relative preferences that voters have for their second choice. Suppose we assume that all minority voters are indifferent between the majority candidates and rank both as their second/third preference with utility 0. Figure 2 presents the simplex when $u_{si} = 0$. Minority voters' only undominated strategy is to vote only for their first preference,

FIGURE 2. Equilibria under Straight Voting with No Minority Voter Preferences over D and R

the minority candidate. If voters perceive that $p_{RD} = 1$ (if a tie for second place occurs, it is expected to be between the two majority candidates, and we are at the top vertex of the simplex), then an equilibrium exists in which majority voters also vote only for their first preference, and the equilibrium outcome is expected to be $S \gg D \approx R$.

The important conclusion from this discussion is that there are a number of straight voting equilibria in which the minority candidate is expected to be in a close three-way race and thus has a positive (and high) probability of being selected for one of the seats in the multimember district. Moreover, if minority voters perceive little difference between the two majority candidates ($u_{SD} = 0$ and $u_{SR} = 0$), then it is possible in straight voting for the minority candidate to be expected to receive the most votes and win one of the two seats. Thus, it is quite possible for minority candidates to be elected from double-member districts under straight voting, even when minority voters also prefer one majority candidate over the other. And when minority voters see no difference between the majority candidates, an equilibrium exists in which the minority candidate wins for sure. We summarize these results in proposition 1.

PROPOSITION 1: *Under straight voting, the voting game results in voting equilibria that are consistent with two expected electoral outcomes: $D \approx R \gg S$ and $D \approx R \approx S$. If minority voters are indifferent between the two majority candidates, then an additional equilibrium*

exists in which the minority candidate is the expected first-place winner: $S \gg D \approx R$.

Cumulative Voting Equilibria. In cumulative voting elections, voters have the additional option of cumulating their two votes on a single candidate and thus choose among more possible vote vectors. It is straightforward to show (as in Merrill 1981) that an undominated strategy for all voters involves cumulating their votes for a single candidate. Consider, for example, the possible voting strategies of r voters. Clearly, vote vector $(0,2,0)$ dominates $(0,1,0)$, and $(2,0,0)$ dominates $(1,0,0)$. The question remains whether $(0,2,0)$ and/or $(2,0,0)$ dominate $(1,1,0)$. From equation 1, the expected utility for an r voter from $(0,2,0)$ equals $2p_{RD}(1 - u_r) + 2p_{RS}(1 - 0)$; the expected utility of vote vector $(1,1,0)$ equals $p_{RS}(1 - 0) + p_{DS}(u_r - 0)$; and the expected utility of $(2,0,0)$ equals $2p_{RD}(1 - u_r) + 2p_{DS}(u_r - 0)$. For the expected utility of $(1,1,0)$ to exceed the expected utility of $(0,2,0)$, $p_{DS} > (1/u_r)[2(1 - u_r) + p_{RS}]$. For the expected utility of $(1,1,0)$ also to exceed the expected utility of $(2,0,0)$, however, $p_{DS} < (1/u_r)[2(1 - u_r) + p_{RS}]$. Since the two conditions cannot hold simultaneously, either the expected utility from splitting votes is less than the expected utility from cumulating votes for one of the voter's top two preferences, or the voter is indifferent among all three possible strategies. By a similar logic, we can show that the other types of voters will either cumulate their votes for one of their top two candidates or randomize

FIGURE 3. Equilibria under Cumulative Voting with Minority Voter Preferences over D and R

among all three voting strategies. Note, however, that splitting votes between a voter's top two preferences is only a weakly dominated strategy and can be optimal in mixed strategy equilibria. Therefore, while cumulating is always undominated, splitting is also undominated for some voters in many of the voting equilibria we describe below.

We need to consider the possible equilibria in which voters either cumulate votes for one of their two top preferences or use mixed strategies. Figure 3 presents a pivot probability simplex for cumulative voting. In regions A and C, s_R voters cumulate their votes for their second preference (R), since they perceive that R and D are likely to be in a close race for second place. In regions B, D, E, and F, they cumulate their votes for candidate S, and on the boundary they mix between the three voting strategies (0,0,2), (0,2,0), and (0,1,1). In regions A and B, s_D voters cumulate their votes for D; in regions C, D, E, and F, they cumulate their votes for S; and on the boundary they mix. Type r voters cumulate their votes for R in regions A, B, C, D, and E; cumulate for D in region F; and mix on the boundary. Type d voters cumulate their votes for D in regions A, B, C, D, and F; cumulate for R in region E; and mix on the boundary.

There are three possible equilibria in the cumulative voting game, points 1, 2, and 3 in Figure 3 (see also the summary in Table 2). At point 1, s_D and s_R voters mix between their pure strategies, and d and r voters cumulate for their first preference. At point 2, s_D voters mix, s_R voters cumulate for the minority candidate, and

majority voters cumulate for their first preference. At point 3, s_R voters mix, and s_D , r , and d voters cumulate. At point 1, all the conditional pivot probabilities are positive, and the equilibrium outcome is expected to be a close three-way race, $D \approx R \approx S$. At point 2, $p_{DS} = 0$, $p_{RS} = u_{sD}(1 - u_{sD})$, $p_{RD} = 1 - [u_{sD}(1 - u_{sD})]$, and the equilibrium outcome is expected to be $D \approx S \gg R$. That is, because the conditional probabilities that both D and S will be in a close race with R for second place are positive if a close race for second occurs, minority voters of type s_R mix. At point 3, $p_{RS} = 0$, $p_{DS} = u_{sR}(1 - u_{sR})$, $p_{RD} = 1 - [u_{sR}(1 - u_{sR})]$, and the equilibrium outcome is expected to be $R \approx S \gg D$. Note that as $u_{si} \rightarrow 0$, then $p_{RD} \rightarrow 1$ in all three equilibria, and voters perceive a very high probability that the minority candidate will win a seat.

If minority voters are indifferent between the two majority candidates, that is, $u_{si} = 0$, $\forall i$, then there is only one unique voting equilibrium with the expected outcome $S \gg D \approx R$ in which the minority candidate wins a seat for sure. This case is illustrated in Figure 4.

In summary, with cumulative voting in multimember districts, the minority candidate is likely to be in either first or second place in all the possible equilibria. As with straight voting, the less difference minority voters perceive between the two majority candidates, the more likely are equilibria to exist in which the minority candidate has a high probability of winning. The cumulative voting results are summarized in the following proposition.

FIGURE 4. Equilibria under Cumulative Voting with No Minority Voter Preferences over D and R

PROPOSITION 2: *In cumulative voting there are three possible equilibria that correspond to electoral outcomes $D \approx R \approx S$, $D \approx S \gg R$, and $R \approx S \gg D$. If minority voters are indifferent between the two majority candidates, then there is only one unique equilibrium that results in electoral outcome $S \gg D \approx R$.*

Our theoretical analysis is limited to double-member district elections with three candidates. As in the design of the experiments, we chose this configuration because it makes the exposition clear and simple, reflects the most likely configuration when candidate entry is endogenous (Cox 1994), and presents the case in which minority voters are most likely to use both voting systems to advantage the minority candidate. An interesting extension would be to increase the number of candidates. While a full analysis of the possible equilibria is beyond the scope of this article, we can speculate on some of the possibilities. For example, suppose there are two minority candidates instead of one, and minority voters view each equally. Minority voters now face a coordination problem. Equilibria still exist in which one of the minority candidates can win in both voting games, but that requires minority voters to coordinate their votes on one of the two minority candidates, and additional equilibria are likely to exist in which minority voters do not coordinate. If minority voters differ in their preferences for the minority candidates (even if just slightly), then the coordination problem becomes more difficult. Similar coordination problems also would arise for majority voters if there were more than one *D* or *R* candidate. Experimental

evidence shows, however, that in coordination problems in simple plurality rule, single-winner voting games, voters willingly coordinate using polls or campaign expenditures (for the experimental evidence, see Forsythe, Myerson, Rietz, and Weber 1993, 1996; Myerson, Rietz, and Weber 1996; for a theoretical analysis, see Fey 1997).

THE EXPERIMENTS

We developed experiments to test our theoretical predictions about voting behavior and election outcomes under straight and cumulative voting in multimember elections. The experimental method is necessary because data from actual elections of this type are rare. Due to some recent court decisions, cumulative voting has been adopted in a few small local elections. Cole, Taebel, and Engstrom (1990) and Still (1990) examined voter survey and aggregate voting data in local U.S. elections with cumulative voting and found some evidence that it increased the election of minorities. Nevertheless, cumulative voting is not often used, and most of the available data tend to be aggregated.

Several studies analyze aggregate election data from multimember elections. Cox (1984), for example, examined outcomes in double-member district elections with straight voting, particularly historical situations in which there were two parties but one was more dominant. Cox found that in Indiana and Michigan the majority party typically won both seats, while in Ohio

and England there were more split outcomes. While these mixed empirical results are consistent with our theoretical predictions (i.e., both may be equilibria, depending upon the perceived probability of a second-place tie), data aggregation may obscure the factors at work. Cox (1984) also investigated voting behavior in multimember district elections in England. He estimated the probability of a tie from the ex post election outcomes and then analyzed actual vote vectors from the election records. He found that voters who perceive a high probability that their most preferred candidate is in a close race for second place will vote for only their first choice. When they perceive a high probability that their second choice is in a close race for second place (but not with their preferred candidate), they vote for both their first and second choice. In both examples, Cox arrives at results consistent with our theoretical analyses of straight voting, but the aggregate data do not allow him to link these outcomes to specific individual-level behavior.

Another reason for using the experimental approach is that it allows us to compare the two electoral systems while holding voter preferences constant. In the experiments, we tied each subject's payment for participation in the study to the election outcomes, as described below. Different groups of players received different payoffs for each outcome. Their voting decisions could affect the amount of payment by as much as \$20 (the experiment took approximately two hours). Thus, we could induce voter preferences and compare the different voting systems under a given configuration of preferences.

The experimental approach also allows us to consider how cumulative voting outcomes may differ according to the extent of minority voter preference for the majority candidates. That is, the theory predicts that if minority voters prefer one majority candidate over the other, then they are less likely to cumulate their votes on the minority candidate, who thus has a lower probability of winning a seat. By inducing minority voters' preferences, we can compare their voting behavior and the electoral outcomes holding the voting system constant.

Finally, the experiments help identify many of the equilibria we theorize are most likely to occur when voters make consequential decisions. The ability to test which equilibria actually occur represents a major advantage of laboratory elections over research using naturally occurring elections.

Experimental Design

In our experiments, we selected the case of minority voters indifferent between the majority candidates for several reasons. First, this configuration most closely reflects the substantive problem of minority representation. Assuming racially motivated voting, minority voters care more about the characteristics that differentiate between the majority and minority candidates than between the majority candidates. Second, this particular preference configuration allows us to compare the extent to which each electoral system facili-

tates minority representation. Only when minority voters are indifferent between the majority candidates does the $S \gg D \approx R$ equilibrium outcome exist under both straight and cumulative voting. Comparing the two electoral systems thus allows us to test under which system this outcome occurs more often. Our theory predicts, however, that minority candidates still have a positive probability of winning under both straight and cumulative voting when minority voters are not indifferent between the two majority candidates, so our experimental results are not knife-edged.

We also consider the case in which minority voters prefer D to R under cumulative voting. As discussed previously, when minority voters have a preference for a majority candidate, the outcome $S \gg D \approx R$ is no longer an equilibrium in cumulative voting. The only equilibrium predicted in this case is the one in which minority voters mix between vote vectors (1,0,1) and (0,0,2) and majority voters all cumulate for their most preferred candidate; the expected electoral outcome is then $D \approx S \gg R$. Figure 5 illustrates the simplex for the case in which all minority voters prefer D to R .

The experiments consisted of three sessions of two-winner, three-candidate computerized elections. One session involved straight voting, while the other two used cumulative voting. In the straight session and cumulative I, minority voters are indifferent about the majority candidates; in cumulative II, minority voters prefer D to R . The sessions were conducted at the University of Iowa and drew from a pool of approximately 450 subjects. They were recruited from the population of students attending MBA and undergraduate classes in the colleges of Business Administration and Liberal Arts.

Upon arrival, the subjects were seated at computer terminals in a large classroom and given printed instructions (see Appendix). Dividers concealed each subject's screen from the view of others. The instructions were read aloud and questions were answered in public in order to make all instructional information common knowledge. In the straight session and cumulative I, 28 subjects participated in each session. In cumulative II, 22 subjects participated.¹⁹

Each subject was given a voter identification number and assigned to an initial voting group consisting of half the subjects in that session. The groups were then divided into three "types," distinguished by the cash payoffs they received conditional upon each candidate winning a seat. Voters knew their own type plus the distribution of voter types in the groups, but they did not know the identity of other voters in their group. Table 3 reports the payoffs used in the experiments.

Each group participated in one election using the voting rule for that session. After each election, sub-

¹⁹ Cumulative II had fewer subjects due to unexpected constraints. We also ran a version of cumulative II for seven periods with 28 subjects before a computer failure and the withdrawal of one subject. We then ran a version of cumulative II for eight repeated elections, with the remaining 27 subjects divided into two groups and ran eight elections (16 total). While these results are not reported here, they show comparable patterns, including nearly equal percentages of outcomes and voting choices, to the cumulative II session.

FIGURE 5. Equilibria under Cumulative Voting with Minority Voter Preference for D Only

jects were randomly reassigned to new groups and new types. They then used new payoff schedules with randomly rearranged and relabeled rows and columns. This allowed us to observe a number of different groups in each cohort while minimizing any repeated game effects that might carry over from one group to the next. In each session, we conducted fifty elections. Thus, each subject belonged to 25 different voting groups and participated in 25 elections. This yielded 150 elections for a total of 1,950 voter responses. Within a group, each individual viewed the same complete payoff schedule, except that her own type was highlighted on her computer screen (see Appendix). In this way, each knew her own payoff, the payoffs to the other voter types in the group, and the number of subjects of each type. Subjects did not know the specific assignment of types of other subjects in the room or who was in their group.

The candidates were named Orange, Green, and

Blue to avoid any connotations associated with D , R , and S . For reporting purposes, the voter types and responses have been transformed so that the first listed majority candidate is referred to as D . The outcomes of second-place ties were determined randomly. To do this, we placed colored balls corresponding to the "names" of the tied candidates in a bucket and asked one of the subjects to draw out a ball without looking. That candidate was declared the winner of the tie. After each election, subjects were informed (on their screen) of the vote totals received by each candidate, the winners, and their own payoff.

Experimental Predictions

Given the experimental design, our theoretical analysis makes the following predictions about straight versus cumulative voting.

In straight voting we expect to find three possible equilibrium outcomes.

1. $D \approx R \gg S$. Voters expect that $p_{DR} = 0$, p_{DS} , and $p_{RS} > 0$. That is, voters perceive that if a close race for second place occurs, it will be between either D and S or R and S , but not between D and R . Therefore, d and r voters find it optimal to vote for both majority candidates and cast the vote vector $(1,1,0)$. Type s voters vote only for the minority candidate and cast the vote vector $(0,0,1)$. Thus, D and R are expected to receive the highest (equal) vote shares, S is expected to receive fewer votes, and the expectation is justified.

TABLE 3. Experiment Payoff Schedule

Election Winners				
Voter Types	D	R	S	# of Voters
Straight & Cumulative I				
d	\$0.60	\$0.45	\$0.10	4
r	\$0.45	\$0.60	\$0.10	4
s	\$0.20	\$0.20	\$0.70	6
Cumulative II				
d	\$0.60	\$0.45	\$0.10	3
r	\$0.45	\$0.60	\$0.10	3
s_D	\$0.35	\$0.20	\$0.70	4

TABLE 4. Fraction of Elections Won by Each Candidate

	<i>D</i>	Election Winners <i>R</i>	<i>S</i>	2-way Tie for 2nd Place	3-way Tie for 2nd Place
Straight (50 Sessions)					
Percentage	96.33	97.33	6.33	6	2
Number	48 1/6	48 2/3	3 1/6	3	1
Cumulative I (50 sessions)					
Percentage	52	52	96	12	0
Number	26	26	48	6	0
Cumulative II (50 sessions)					
Percentage	70	40	90	10	0
Number	35	20	45	5	0

Note: Wins are scored as follows: outright win = 1, two-way tie = 1/2, three-way tie = 2/3.

2. $D \approx R \approx S$. Voters expect that p_{DR} , p_{DS} , and $p_{RS} > 0$. That is, it is possible for any of the three candidates to be in a two-way tie for second place, if a close race for second place occurs. Majority voters find it optimal to mix between voting for their first preference and their top two preferred candidates, that is, d voters mix between (1,0,0) and (1,1,0), while r voters mix between (0,1,0) and (1,1,0). Type s voters vote only for the minority candidate and cast vote vector (0,0,1).
3. $S \gg D \approx R$. Voters expect that $p_{DS} = p_{RS} = 0$, and $p_{DR} = 1$. That is, they expect that if a close race for second place occurs, it is between candidates D and R . Therefore, both the minority and majority voters find it optimal to plump their votes, voting only for their preferred candidate. Type d voters choose vote vector (1,0,0), type r voters choose (0,1,0), and type s voters choose (0,0,1).

In cumulative I we expect to find only one equilibrium outcome: $S \gg D \approx R$. Voters expect, as with the third equilibrium under straight voting, that $p_{DS} = p_{RS} = 0$, and $p_{DR} = 1$. That is, they expect that if a close race for second place occurs, it will be between D and R . Both the minority and majority voters find it optimal to cumulate their votes, voting only for their preferred candidate. Type d voters choose vote vector (2,0,0), type r voters choose (0,2,0), and type s voters choose (0,0,2).

In cumulative II we expect to find only one equilibrium outcome: $D \approx S \gg R$. Voters expect that $p_{DS} = 0$, $p_{RS} > 0$, and $p_{DR} > 0$. That is, they expect that if a close race for second place occurs, it will be between D and R or R and S , but not D and S . Type d voters choose vote vector (2,0,0), type r voters choose (0,2,0), and type s voters find it optimal to randomize among vote vectors (1,0,1), (2,0,0), and (0,0,2).

Experimental Results

Election Wins. We first consider the number of wins by each candidate type. Table 4 presents these results. We find that the minority candidate wins a seat in very few straight voting elections (6.33%) and wins a seat in most cumulative voting elections (96% in cumulative I and 90% in cumulative II). These differences are highly

significant.²⁰ The results support the hypothesis that a minority candidate win in multimember elections is much more likely under cumulative than straight voting. As predicted, minority candidates won fewer seats in cumulative II than in cumulative I. A difference in means test shows that the difference in the share of seats won by minority candidates in cumulative I and cumulative II is significant at the .10 level (one-tailed test, $t = 1.28$), despite the fact that the relative proportion of minority voters was larger in cumulative II. Also, the two majority candidates won nearly the same fraction of elections under straight voting and exactly the same fraction under cumulative I. As expected, D won more seats than R in cumulative II (D won a seat 70% of the time, while R won only 40% of the time, a difference significant at the .02 level, $t = 2.44$, two-tailed test). These aggregate electoral outcomes suggest that in straight voting the equilibrium outcome $D \approx R \gg S$ is most likely. The predicted unique equilibrium outcomes of $S \gg D \approx R$ and $S \approx D \gg R$ in cumulative I and II, respectively, are also supported empirically by these results.

Voting Behavior. To understand the behavior that generates the electoral outcomes, it is important to examine the individual vote strategies in detail. Table 5 reports the vote vectors used by the voters in all the elections. Bold-face type denotes vote vectors that are not strictly dominated. In the straight voting session, 89.5% of d voters and 87% of r voters cast the vote vector (1,1,0). This behavior is consistent with the equilibrium outcome $D \approx R \gg S$ and reflects one of the strategies in the mixed strategy equilibrium for $D \approx R \approx S$. Very rarely, however, did the majority voters vote only for their preferred candidate (0.5% for d voters, 3% for r voters), although this was also an equilibrium strategy, consistent with equilibrium outcome $S \gg D \approx R$ and one of the strategies in the mixed strategy equilibrium for $D \approx R \approx S$. Thus, majority voters appeared hesitant to plump their votes and generally

²⁰ We test the difference in the share of seats won by the minority candidates in straight versus cumulative I and straight versus cumulative II elections. Testing against the null hypothesis that mean (1) - mean (2) = 0, the two-tailed test results in $t = -24.02$, $p = .00$, for straight versus cumulative I, and $z = -16.92$, $p = .00$, for straight versus cumulative II.

Note: Boldface type indicates undominated vote vectors.

adopted strategies consistent with the equilibrium in which the two majority candidates are expected to win. This behavior is consistent with the belief that likely ties for second place will be between one of the majority candidates and the minority candidate, not between the two majority candidates.

Minority voters in the straight elections, by contrast, used only one of their votes in a majority of cases. As reported in the last column of Table 5, minority voters cast the vote vector (0,0,1) 54% of the time, which is significantly greater than the plumping that occurred among majority voters ($t = -15.05, p = .00$, comparing the share of *d* and *s* voters using an unpaired difference in means test, H_0 = equal means; $t = -13.91, p = .00$, comparing the share of *r* and *s* voters). This strategy was their dominant strategy in all the possible equilibria under straight voting. Still, in a surprisingly large number of elections, they also cast votes for one of the majority candidates, and in 16.3% of the cases they cast two votes for the majority candidates. While the instructions are very clear that subjects are allowed to vote for only one candidate, voters may initially find this uncomfortable if they are accustomed to voting

systems in which the expectation is that using all of one's votes is preferred. We analyzed the use of dominated vote vectors by election period to determine whether these mistakes were more likely in early elections, reflecting voter "learning." We found that voters used dominated vote vectors significantly less often as the number of election periods increased, as shown in Figure 6.

In the cumulative voting elections, the tendency to use both votes was again evident. Summing across the three voter types, only 4% of the total vote vectors cast in cumulative I and 0.2% in cumulative II consisted of less than two votes (that is, vote vectors [0,0,0], [1,0,0], [0,1,0], and [0,0,1]). Majority voters cast equilibrium-consistent vote vectors, consistent with the only equilibrium outcome of $S \gg D \approx R$, a majority of the time (52% in cumulative I and 51.3% in cumulative II for *d* voters, 52.5% in I and 57.3% in II for *r* voters). Yet, the second most common vote vector was to split votes for the two majority candidates, vote vector (1,1,0), which was cast by *d* voters in 29% of the elections in cumulative I and 30% of the elections in cumulative II and by *r* voters in 30% of the elections in cumulative I and 26% of the elections in cumulative II. While not an equilibrium-consistent strategy for the majority voters, splitting votes between the two majority candidates is only weakly dominated. In other words, voters may be indifferent between this strategy and cumulating, although they will never strictly prefer it. This vote splitting reflects some unwillingness of majority voters to cumulate their votes. That these percentages are (statistically) equal across the two cumulative voting treatments suggests that they reflect the overall tendency of majority voters to choose to split.

In cumulative I, minority voters cumulated their votes on the minority candidate significantly more often (73.3%) than the majority voters cumulated on their first preference ($t = 5.00, p = .00$, comparing the share of *d* and *s* voters, two-tailed unpaired difference in means test; $t = 4.89, p = .01$, comparing the share of *r* and *s* voters). Minority voters also showed a tendency to split their votes between their first preference and one of the majority candidates, casting vote vectors (1,0,1) or (0,1,1) 18% of the time. The tendency of minority voters not to cumulate their votes in cumulative I may partially reflect the lack of familiarity with a cumulative voting system. Nevertheless, the fact that most minority voters did cumulate shows that they recognized the optimality of this strategy. As Figure 6 shows, the use of dominated vote vectors significantly declined with the number of election periods in cumulative voting elections, as it did in straight voting elections. We interpret this trend as reflecting voter learning.

As predicted, minority voters in cumulative II showed a lower tendency to cumulate their votes on their preferred candidate (64%) than in cumulative I. This difference is significant at the .02 level ($t = 2.37$, two-tailed unpaired difference of means test). Moreover, minority voters in the cumulative II treatment voted significantly more often for their first and second preference (they cast the vote vector [1,0,1] in 26.8% of

FIGURE 6. Percentage of Dominated Vote Vectors Cast by Period and Session

the elections) than did minority voters in cumulative I, who cast this vote vector only 8.3% of the time ($t = 5.95, p = .00$). Similarly, voters in cumulative II chose vote vector (0,1,1) 1.2% of the time, while in cumulative I minority voters chose this vote vector in 9.7% of the elections ($t = 4.29, p = .00$). Given the fact that the minority voters constituted very close to a majority of the electorate in these sessions, only a few needed to split their votes between their top two candidates in order for D to have an advantage. Our analysis thus shows that when minority voters have a preference for one majority candidate over another, they tend to cumulate their votes less often, splitting their votes between their first and second preferences.

As a consequence, minority candidates won fewer elections in cumulative II, even though the relative number of minority voters was greater than in cumulative I. If minority voters mix between cumulating and splitting their votes, then there is a lower probability of the minority candidate winning, since there is a positive probability that the minority candidate will be in a close race for second place.

CONCLUSION

We make several contributions in this article. First, we develop and analyze a model of multimember district

elections under straight and cumulative voting when a significant minority prefers one of the candidates. We find that in straight voting one predicted equilibrium outcome is for the two majority candidates to win seats and for the minority candidate to finish third, $D \approx R \gg S$. In this equilibrium, the majority voters vote for both majority candidates, and the minority voters vote only for the minority candidate, even when they prefer one of the majority candidates over the other. This outcome often is the basis for arguing that multimember districts disadvantage minority candidates and minority voters.

Yet, we also found a number of straight voting equilibria in which the minority candidate may win a seat. When minority voters have a preference between the majority candidates, these equilibria usually involve two types of voters using mixed strategies, and the outcome is a close three-way race, $D \approx R \approx S$. Finally, when minority voters are indifferent between the two majority candidates, there is an equilibrium outcome, $S \gg D \approx R$, in which all the voters plump their votes, and the minority candidate is the likely winner. In this equilibrium the majority voters expect that, if there is a close race for second place, it will be between the two majority candidates, so they only vote for their first preference.

In cumulative voting we also found a number of

equilibria. The theory predicts that voters in these elections should cumulate their votes or use a mixed strategy, that is, split their votes between their first and second choice and cumulate for either. We find that when minority voters prefer one majority candidate over another, only mixed strategy equilibria exist. Thus, cumulating votes is not the only predicted equilibrium strategy under cumulative voting, and vote splitting under cumulative voting may be an optimal strategy. In these elections, the expected outcome is a close three-way race or a close race for the first seat between the minority candidate and one of the majority candidates. In both types of equilibria, the minority candidate has a positive probability of winning a seat in the multimember district, although the outcome is not certain. When minority voters are indifferent between the two majority candidates, there is only one unique equilibrium: All voters cumulate for their first preference, and the minority candidate is likely to receive the most votes. If a close race for second place occurs, it is between the two majority candidates. Hence, cumulative voting does advantage minority candidates in multimember district elections since, unlike straight voting, in all the possible equilibria the minority candidate has a positive probability of winning.

The second major contribution is to test the theoretical predictions. We used an experimental design that reflects a preference configuration most likely (theoretically) to result in a win for minority candidates in both straight and cumulative elections. That is, in this preference configuration equilibria exist in both types of elections in which the minority candidate wins for sure. We believe that this design provides strong support for the hypothesis that minority candidates are advantaged in cumulative voting over straight voting elections.

We found very few wins for minority candidates in the straight voting elections, even in the preference configuration that can theoretically result in the equilibrium outcome of a sure win for the minority candidate. In examining the individual voter strategies, it appears that in most cases the majority voters used the equilibrium strategy consistent with the minority candidate coming in third (not plumping their votes), and the few minority wins were likely the consequence of a small number of voter errors. In the cumulative voting elections, we found a significantly larger number of minority candidate wins. While majority voters did not cumulate their votes as frequently as predicted and often split their votes (which is a weakly dominated strategy), minority voters did cumulate most often. Thus, minority candidates won a large number of elections. The results, therefore, suggest that cumulative voting can lead to a larger number of wins by minority candidates than can straight voting.

We also considered cumulative voting when minority voters have a preference for one majority candidate over another. We found that, as expected, minority candidates win fewer seats than when minority voters are indifferent between the two majority candidates. A significant number of times, minority voters split their two votes between the minority candidate and their

preferred majority candidate rather than cumulate on the minority candidate. These results show that when minority voters have a preference for one majority candidate, cumulative voting can lead to fewer minority candidate wins and less cumulating of votes by minority voters.

The implications for minority representation are straightforward. Research on single-member district elections reveals that majority voters can generally coordinate on such signals as polls or campaign strength to defeat minority candidates (Forsythe, Myerson, Rietz, and Weber 1993, 1996; Myerson, Rietz, and Weber 1996). We show that minority candidates will also generally lose under straight voting in multimember districts.

Yet, a sufficiently large and coordinated minority can elect favored candidates to some of the seats in multimember districts under cumulative voting, particularly if minority voters are indifferent between the majority candidates. In fact, the combination of multimember districts, cumulative voting, and minority voters indifferent about majority candidates virtually assured minority representation in the experimental elections. Thus, for achieving minority representation, we conjecture that this combination can serve as a viable alternative to deliberate (and apparently unconstitutional) racial gerrymandering. The combination is not a guarantee, however, if minority voters have a preference for one of the majority candidates, in which case minority voters are less likely to cumulate on the minority candidate, and minority wins are less likely.

APPENDIX: INSTRUCTIONS FOR STRAIGHT VOTING

General

This experiment is part of a study of voting procedures. The instructions are simple and if you follow them carefully and make good decisions, you can make a considerable amount of money which will be paid to you in cash at the end of the experiment.

The experiment will consist of a series of separate decision making periods. In each period you will have the opportunity to vote in an election with three candidates. The candidates are named Orange ("O"), Green ("G") and Blue ("B"). You must vote according to the rules discussed below. The votes cast will determine the two (2) winning candidates in each election. In the next period, the process will be repeated, with the exception that the identities of some of the members in your voting group will change. Your payoff in each period will depend upon your payoff schedule for the election and on which candidates win the election. (We will describe payoff schedules and the procedure for determining payoffs in more detail later.)

Voting Groups. Initially, each participant will be assigned randomly to one of two groups of voters labeled group "A" and group "B." (When you have been assigned to a voting group, your participant identification number followed by your voting group's letter will appear at the top center of your computer screen.) In each period, two separate and totally independent elections will take place, each involving one of the two groups of voters. Your payoff will depend only on

your decisions and those of the others in your group. The decisions made by the other group of voters will have no effect on your payoffs.

After each period, we will change the voting groups. When this happens, all participants will again be randomly assigned to one of two new groups. After each re-assignment, the members of the group you are in and the individual payoff schedules will generally not be the same as they were previously.

Payoff Rules

In each period, the payoff you receive will be determined by which two candidates win your voting group's election. For each group you are in, a payoff schedule will automatically appear in the upper left corner of your computer screen. There are three types of voters in each group. Voter types differ by their payoffs. The payoff schedule shows your voter type, how payoffs will be determined for your voter type, how payoffs are determined for other voter types and the number of voters of each type. As an example, suppose that you are initially assigned to a group with the payoff schedule displayed below:

Payoff from Winner			# of Voters
O	G	B	
\$0.15	\$0.35	\$0.10	6
\$0.35	\$0.05	\$0.20	6
\$0.10	\$0.00	\$0.50	4

Your payoffs are determined by those listed in the highlighted row. Thus, your payoffs will be determined by the second row of the payoff schedule. You can also see that there are 5 other voters besides yourself with the same payoffs as you. There are 6 voters with payoffs corresponding to the first row of the payoff schedule and 4 voters with payoffs corresponding to the third row of the payoff schedule. Your payoffs each period are determined by your row in the "payoff from winner" section. In the election the top two vote receivers will both be declared winners. You will receive the payoffs listed in your row under the winning candidates. Thus, if you had this payoff schedule, you would receive the following payoffs: \$0.35 if the orange candidate (O) is a winner; \$0.05 if the green candidate (G) is a winner and \$0.20 if the blue candidate (B) is a winner. Since two candidates will be declared winners, you will receive the sum of the payoffs for the two winners. According to this payoff schedule, you will receive three possible sums of payoffs. You could receive: \$0.55 if Orange and Blue are the two winners; \$0.40 if Orange and Green are the two winners and \$0.25 if Green and Blue are the two winners. Thus, for each winner you receive the "payoff from winner" listed under the winning candidate. Remember that this is only an example and does not correspond to the actual payoff schedules used in this experiment.

Voting Rules

Each period, when the election is held, you must decide whether to abstain (not vote for any candidate) or cast a vote in your group's election. If you do decide to vote, you must do so according to the following rule (which applies to all voters in your group):

[Straight Voting: VOTING RULE: You may cast either 1 vote for each of two candidates, or

1 vote for one of the candidates.

You may abstain by casting 0 votes for all three candidates.]

[Cumulative Voting: VOTING RULE: You may cast either 2 votes for one of the candidates, or 1 vote for each of two candidates, or 1 vote for one of the candidates.

You may abstain by casting 0 votes for all three candidates.]

(This rule will also be given in the "VOTING RULE BOX" which will automatically appear on your screen.)

Each period, before the election is held, a "BALLOT BOX" will automatically appear on your computer screen announcing the election. In the BALLOT BOX, the three candidates are listed separately. There is also a number below each candidate. At any given time, these numbers show the votes you would be casting for each candidate should you submit your ballot at that time. After all participants have been notified of the upcoming election, it will be held and you will be allowed to enter votes in the BALLOT BOX and submit your ballot.

When the election is held, a cursor will appear in your BALLOT BOX and you will be allowed to change the number of votes for each candidate on your ballot. To change the number of votes for a candidate, use the ← and → arrow keys to highlight the number below the candidate. Then use the ↑ and ↓ arrow keys to increase or decrease the number of votes you are giving to that candidate. As you change the number of votes for each candidate, the message on the right side of your BALLOT BOX will change. This message tells you whether your ballot is currently (1) valid according to the above rule, (2) not valid according to the above rule, or (3) an abstention.

Prior to submitting your ballot, make sure it is valid. If you submit an invalid ballot, you will receive a message in your BALLOT BOX stating that your ballot is invalid. You will have to change your ballot before re-submitting it. To submit your ballot, press the "Enter" key. If your ballot is valid, you will be asked to confirm your submission. If your ballot is satisfactory, press "y." If not, press "n" and you will be allowed to change the votes on your ballot. Even if you choose to abstain, you must submit a ballot. To abstain, enter zeros (0's) under each candidate and press "Enter." Then confirm this ballot by pressing the "y" key.

After all voters have submitted ballots, the computer will total the votes for each candidate. The votes cast by one voting group will have no effect on the other group's election. For each group, the two candidates with the highest number of votes in an election will be declared the winners of that election. If there is a tie for first place, then these two candidates are both declared the winners. If there is a tie for second place, we will randomly select which of the two second place finishers will be declared a winner. Specifically, we have a tie-breaking bucket and we have three colored balls: an orange one, a green one and a blue one. Balls corresponding to the tied candidates will be put in the bucket and one of you will be asked to randomly draw a ball from the bucket. The candidate whose name is the same as the color of the selected ball will be declared one of winners. If there is a three-way tie, we will put all three balls in the bucket and one of you will be asked to randomly draw two balls from the bucket. The two candidates drawn will be declared the two winners in that election. After the winners of the election have been announced, the computer will determine your payoffs and notify you of the results.

Notification and Recording Rules

After each election, you will be notified of the outcome in the following manner. After the election for your voting group, a "HISTORY BOX" will appear on the right side of your screen. It gives the votes you cast and the total votes cast by your group for each candidate. You may check your recorded vote in the election by comparing it to your previous ballot (which will remain in your BALLOT BOX). The HISTORY BOX also highlights the number of votes for the winning candidates in yellow and gives your payoff for that election. After voting groups are re-assigned, you will begin with a new HISTORY BOX. Thus, your HISTORY BOX only contains information from your current group.

You have also been given several Record Sheets that are similar to HISTORY BOXes. To have a permanent record of the information that will appear in your HISTORY BOXes, you should fill out a line in a Record Sheet for each election. First, record your ID number and group from the top center of your computer screen. Then you should record the event (election), how you voted and the outcome of the election in the spaces provided. You should also circle the vote total of the winning candidates and record your payoff for each election.

When the experiment is completed, the computer will sum your earnings from each election and place the total on your screen. You can confirm this number by summing your earnings recorded on your record sheets. Please place this amount on your receipt. The experimenter will pay you this amount in cash.

If you have any questions during the experiment, ask the experimenter and he or she will answer them for you. Other than these questions, you must keep silent until the experiment is completed. If you break silence while the experiment is in progress, you will be given one warning. If you break silence again, you will be asked to leave the experiment and you will forfeit your earnings.

Are there any questions?

Structure, Behavior, and Voter Turnout in the United States

RICHARD J. TIMPONE *State University of New York at Stony Brook*

Electoral participation in the United States is examined to provide a clearer account of the effect of the registration requirement on individual voting behavior. Pooling NES data from 1980, 1984, and 1988, I first model, with traditional and selection bias techniques, the full electorate to distinguish among three groups: nonregistrants, registered nonvoters, and voters. Analyses limited to recent movers are then reported to understand more fully the forces associated with the actual decision calculi of registering and voting. The influences of many factors commonly accepted as important determinants of voting are disentangled, and their effect at each stage is ascertained. Factors yielding inconsistent effects in previous research or believed to be unimportant—such as race, gender, attitudes toward the candidates, and trust in government—are shown to deserve closer scrutiny by electoral scholars.

More than seventy years ago, in distinguishing among types of electoral nonparticipants, Merriam and Gosnell (1924, 252) observed: "Entirely different reasons were emphasized by those who were not registered than by those who were registered but did not vote in the particular election." Although more recent discussions have demonstrated important distinctions among groups of nonvoters, some have little to say about the relationship between the institutional structure of electoral participation and individual behavior (Conway and Hughes 1993, Marchant-Shapiro 1994, Ragsdale and Rusk 1993). Merriam and Gosnell's seminal work, however, implies that the structural context in which electoral decisions take place may play an important role in citizen's calculi. This article presents a systematic analysis of these forces to gain further insight into electoral participation.

Many studies have acknowledged that registration and administrative forces may create barriers to participation, but these factors are often used in single models of voter turnout. For both theoretic and statistical reasons, this approach may mask or distort some important relationships. While there are distinct traditions in the electoral behavior literature, there has been much convergence in their extensions, and "hybrid" models are now relatively common (Aldrich and Simon 1986, Dalton and Wattenberg 1993, Dennis 1991). The framework used here extends the hybrid approach by more fully incorporating the short-lived (in its independent state) tradition of the legal-institutional model presented by Rusk (1970, 1971, 1974) and

Converse (1972, 1974). "Basically, the theory postulates that legal-institutional properties of the electoral system—ballot and registration systems, voting systems (e.g., plurality, proportional representation), suffrage requirements, and the like—have important effects in influencing and shaping voting behavior" (Rusk 1974, 1044, emphasis added). Despite the compelling logic of this conceptualization, it is often considered as an alternative rather than as an approach that might be integrated with individual-level forces. It was largely absorbed by other approaches that added contextual and legal factors, such as registration, as items for which models should control. Although the majority of turnout models argue for putting first things first (i.e., registration), those that incorporate registration and administrative forces have generally treated these simply as factors to be controlled. This is a reasonable approach in aggregate comparisons, such as across nations (Jackman 1987; Powell 1980, 1986) or within the United States between cities or states (Kelley, Ayres, and Bowen 1967; Kim, Petrocik, and Enokson 1975). Even at the aggregate level, however, recent works have incorporated the two-stage process more directly (Cox and Munger 1989, 1990; Fort 1995). For individual-level behavior, the proper incorporation of the institutional structure in our models is even more important to understand the nature of behavior.¹

REGISTRATION IN THE UNITED STATES

While registration initially may seem to be little more than "democratic housekeeping" (Spafford 1991), a number of competing purposes exist, such as preventing electoral fraud, ensuring that all who are eligible

Richard J. Timpone is Assistant Professor of Political Science, SUNY at Stony Brook, Stony Brook, NY 11794-4392; after July 1: 2140 Derby Hall, 154 North Oval Mall, Ohio State University, Columbus, OH 43210-1373.

A previous version of this article was prepared for the annual meetings of the Midwest Political Science Association, Chicago, IL, April 14–6, 1994. This research was supported by National Science Foundation Dissertation Improvement Grant SBR-9308081. I am indebted to the ICPSR and the University of Michigan Center for Political Studies for making the NES data available. I thank Stanley Feldman and Wendy Hansen for their technical assistance and Richard Brody, Gary Cox, Tali Mendelberg, Kathleen McGraw, Helmut Norpoth, Barbara Norrander, Christopher Wlezien, and Raymond Wolfinger for their helpful comments on earlier drafts. As always, any errors in analysis or interpretation are entirely my own.

¹ Elsewhere, I have developed a four-level taxonomy of relationships between aggregate level contextual and institutional forces and individual-level behavior (Timpone 1994, Timpone and Mealy 1996). In this taxonomy, relationships may be simple and straightforward with either no relationship or a general additive influence that does not alter the underlying behavioral dynamics involved. In such situations, comparative systems could be examined in single models controlling for the different systemic factors of interest. Situations may be more complex, however. At the third level, contextual forces may influence macro and individual-level relationships differently. At the fourth level, the one hypothesized to reflect the influence of registration requirements, aggregate forces fundamentally alter the individual-level task and calculus.

are included on the list, supporting other functions of the system, and lending credibility and legitimacy to the election (Courtney 1991, Kimberling 1991). In balancing these, the United States has customarily given a higher priority to minimizing corruption, at the expense of fuller registration. This, along with the tradition of individualism and the distrust of an intrusive government, led to the general acceptance of the two-step process of participation, whereby an individual has the responsibility to register and only then can go to the polls. While scholars of electoral participation in the United States readily acknowledge this structure, its implications are often not fully appreciated. Fuller consideration of the two-step process leads inevitably to questions about traditional approaches to modeling voter turnout in the United States. Although registration and voting are fundamentally linked acts, and the burden of registration is far less than it has been in the past, they still differ in basic ways. Before passage of the National Voter Registration Act, Rosenstone and Hansen (1993, 136) explained: "Registering to vote is often much more difficult than voting itself, requiring a longer journey at a less convenient hour to complete a more complicated procedure before the peak of the campaign." Thus, the institutional requirement of first registering and then voting creates a process in which the two stages differ in place, time, and kind.

Place

When people decide to cast a ballot on election day, they go to the polling place in their home precinct. This is rarely the same location for registration. Before passage of the National Voter Registration Act of 1993, many states allowed mail registration and deputized registrars, but no universal registration procedure existed. While the need for an onerous trip has been eased over time, registering or obtaining mail registration forms traditionally required a separate trip, even in several states with election-day registration systems. This should not be ignored, since even relatively minor differences in the distance to polling places in cities significantly affects voter turnout (Schlichting and Tuckel 1994).

Time

The temporal span between the tasks of registering and voting has been found to be the strongest deterrent associated with registration (Wolfinger and Rosenstone 1980, Teixeira 1992). One reason for this was noted nearly a century and a half ago, when Tocqueville ([1850] 1969, 135) observed that "as the election draws near, intrigues grow more active and agitation is more lively and wider spread." He considered the time of a presidential election to be like a moment of national crisis. Efforts to enlist support, general campaigning, and even media emphasis increase over time and peak on election day. In the service of curbing fraud and making the administrative task easier, most states close their registration books weeks before the polls open. In 1992, the average closing date was more

than three weeks in advance, forcing those not registered in most states to make the initial commitment to vote even before the first of the presidential debates.

Kind

Not only does one need to register significantly in advance of election day in most states, often at locations less convenient than polling places, but also the nature of the registration act is fundamentally different from casting a ballot. Rather than a political decision, a registration form is generally an administrative document. While not overly difficult in recent times, registration remains a fundamentally bureaucratic task with which some people are uncomfortable. President Clinton declared in his remarks at the signing of the National Voter Registration Act of 1993: "Voting should be about discerning the will of the majority, not about testing the administrative capacity of a citizen." This argument underscores the point that registration remains a task fundamentally different from that of actually casting a ballot. And the nature of the task, along with the temporal period when it must be performed, may alter the psychological determinants of each, since "registration usually does not provide the emotional gratification that voting does" (Glass, Squire, and Wolfinger 1984, 52).

This discussion of differences in the tasks of registration and voting should not be interpreted as a claim that either is necessarily onerous. The point remains, however, that they are distinct acts, and an individual must first register and only then can go to the polls in most states. Combining this well-accepted fact with the argument that the two steps differ in regard to place, time, and kind points to a need for closer scrutiny of how this institutional requirement affects individual-level behavior.

ANALYSIS

The ideas set forth above lead to the conclusion that registration, for a variety of theoretical reasons, plays a more complex role in electoral behavior than is sometimes acknowledged. Moreover, this conclusion has statistical implications. The most common approach in turnout models combines the two groups of nonvoters (i.e., nonregistered and registered nonvoters) and compares this combined group to voters, thus collapsing the two-stage process into one (Abramson and Aldrich 1982; Ashenfelter and Kelley 1975; Campbell et al. 1960; Cassel and Luskin 1988; Downs 1957; Ferejohn and Fiorina 1974; Kim, Petrocik, and Enokson 1975; Riker and Ordeshook 1968; Rosenstone and Hansen 1993; Rosenstone and Wolfinger 1978; Teixeira 1987, 1992; Wolfinger and Rosenstone 1980). While these works have greatly extended our understanding of individual-level turnout, explicitly modeling the two-stage nature of the process may yield further insights into participatory behavior. For instance, truly independent factors that affect only one part of the decision calculus (e.g., voting at the polls) will be attenuated to a degree reflected by the size of the group not affected

(e.g., nonregistrants).² If these factors are correlated with others in the model, then the problem becomes less predictable and more troublesome. Not only will some forces appear to have different effects on behavior than actually exists, but also the substantively important role of the registration process and behavioral characteristics cannot be separated, clouding our understanding.

The traditional approach is also problematic for understanding behavior if the underlying nature of the relationship between a factor and electoral behavior differs between the two decisions. Some factors not only may affect just one stage of electoral participation but also may influence the two stages in opposite directions. Some people, for instance, may be less likely to vote in general; yet, once they overcome the initial barrier and register, these individuals may be more likely to vote.

More appropriate specifications of the two-step process of voter turnout in the United States reflect the procedure of first registering and then voting among the subsample of the electorate that is registered. Several studies of individual-level behavior have adopted this approach in their analyses (Erikson 1981, Jackson 1996, Mitchell and Wlezien 1995, Uhlaner 1989).³ Although these specify the two models of registration and turnout of those registered, they treat them as independent models. This is potentially problematic because the universe for the registration equation is the entire electorate, while that for the turnout model only includes those registered, which is clearly not a random subsample of the entire electorate. Problems can occur if the errors in the two equations are correlated. If this is the case, then the error in the second equation—turnout among the registered—will not have an expected value equal to zero, violating standard statistical assumptions and leading to biased results. The appropriate method for examining whether this problem exists is selection bias techniques (Achen 1986, Breen 1996, Dubin and Rivers 1989/1990,

Greene 1993, Heckman 1979, King 1989, Maddala 1983).⁴

Dubin and Rivers (1989/1990) developed the technique, used in the analyses below, that explicitly models selection bias in probit models. This approach uses a full information maximum likelihood procedure to estimate the registration stage for the full electorate and then estimates the turnout stage for those registered, correcting for any correlation in the errors between the two stages. Thus, the registration stage of the selection bias model will be practically identical to an individual model of registration. The degree to which the second stage—turnout among the registered—differs from an independent model of turnout that uses this subsample depends on the magnitude of the correlation of the errors. A correlation of zero is equivalent to running the two independent models, while correlations diverging from zero lead to differences based on corrections of the second-stage estimates. The approach addresses both the nonnormality of the errors due to the dichotomous nature of the dependent variables and the nature of the bias between the equations.

In sum, a two-step approach to the analysis of turnout is the most appropriate for theoretical reasons, and a selection bias model is needed to examine and deal with the relationship between the errors. In deciding what factors to include in the models, I use the hybrid approach mentioned earlier, which integrates the classic models of voter turnout. The items included have been examined previously, but the critical issue addressed here is the manner in which the two-stage process operates in the electorate. The dependent variables are the validated *Registration* and *Turnout* measures from the 1980, 1984, and 1988 National Election Study.⁵ Five general groups of factors are

² While there is disagreement over group size, registered nonvoters cannot be ignored if one is concerned with nonparticipation. According to state election statistics in 1988, registrants account for 42% of nonvoters, compared to 22% in Census data. Regardless of the data source, the group of registered nonvoters in each is too large a proportion of nonparticipants to ignore, as is often the case, and the size of both groups of nonvoters has increased over time. The merits and problems of each data source are debated elsewhere (Bennett 1990a, 1990b; Gans 1990; Piven and Cloward 1988, 1989, 1990).

³ Ferejohn and Fiorina's (1975) defense of their minimax regret model of voting also made this distinction. They did not explore the issue of registration, but their turnout model only examined those registered. Ignoring the issue of registration, however, leads to the same potential problem from a nonrandom sample seen in the other studies in which the two steps are treated independently. Also, while the work of Mitchell and Wlezien (1995) is the most systematic attempt thus far to study the influence of administrative barriers in both registration and turnout models, their models of turnout use the traditional approach of combining the two groups of nonvoters. In addition to these works, Nagler (1991) demonstrates the appropriate manner for testing for the interaction of such features as education and registration laws, but he also uses the single model approach. Thus, while some previous work has made the distinction between the two stages, the fuller specification and paired analyses presented here allow greater insight into the behavioral mechanisms.

⁴ While I argue that selection bias modeling is the appropriate technique for dealing with the problems in the second stage, different models can be employed that reflect distinct underlying processes. The choice rests on theoretic assumptions about the nature of the relationships. The selection bias model is the logical extension of the two-model approach used in the past to incorporate the nature of the process more thoroughly into models of participation (Erikson 1981, Jackson 1996, Mitchell and Wlezien 1995, Uhlaner 1989). The discussion of registration in this article, which distinguishes it from going to the polls in terms of place, time, and kind, not only strengthens the argument for moving beyond the unitary models of turnout but also reinforces the selection bias model as the appropriate likelihood function. Specifications such as an ordered probit ignore the uniqueness of the two tasks and the nonordinal nature of the categories, since some nonregistrants might be more likely to vote on election day, if they were eligible, than registered nonvoters. I believe the difference between these nonregistrants and those who would still fall below the threshold in this case is one of degree rather than kind, maintaining the appropriateness of a two-stage model. While other specifications can deal with the multicategory groups in the electorate and their interrelationship, the selection bias model most directly maps onto the process as theorized in the literature and is capable of dealing with the statistical consequences.

⁵ Although past work has demonstrated that self-report and validated measures lead to few substantial differences in studies of turnout, one must be wary when making finer distinctions between the groups, as is done here. In order to avoid the possibility that factors related to the probability of misreporting are included in the model and lead to biases, validated registration and vote measures are used. Unfortunately, the NES decided not to continue validation

included in the analyses: demographics, items that tap social connectedness, general and election-specific political attitudes, and administrative barriers (variable coding is presented in Appendix A). Some of the specific factors included here have appeared only weakly or inconsistently related to participation in past research. This suggests that the finer distinctions made by incorporating the actual structural process involved yields a clearer image of relationships than in previous work, due to the potential attenuation caused by combining groups that may differ behaviorally.

Although some have argued that demographic factors should be avoided in models that attempt to understand behavior, these factors are still useful proxies for items not measured and remain important controls in behavioral models (Achen 1992, Timpone n.d.). General demographics included in this analysis are *Region* (southern versus nonsouthern states), *Age*, *Race*, *Education*, *Income*, and *Length of Residence in One's Home*.⁶ Due to the background nature of demographic items, they are expected to have a greater influence on registration, because of their tie to more general predispositions regarding participation, than do those centering on the specific election.

A number of researchers have argued that some demographic factors reflect individual ties to the community (Knack 1993; Merriam and Gosnell 1924; Miller 1992; Pomper and Sernekos 1989, 1991; Rosenstone and Hansen 1993; Straits 1990; Teixeira 1992; Verba, Schlozman, and Brady 1995; Wolfinger and Rosenstone 1980). Recent work has demonstrated empirically that a number of these factors reflect an individual's integration into the social milieu (Timpone n.d.), such as frequency of *Church Attendance*, *Membership in Formal Groups*, *Marital Status*, *Home Ownership*, and *Length of Residence in One's Town*. Whether social integration reflects personal self-interest or social norms, the items tapping it are expected to be related to more general political predispositions and to have a greater effect on the act of registration than on turnout at the polls.

Political attitudes linked to longer term predispositions are expected to be distinct from those specific to the election at hand. The more lasting attitudes may be responsive to short-term factors but are likely to be far more stable than those tied to election-specific choices. The long-term predispositions are *External Efficacy* (views of system responsiveness), *Internal Efficacy* (an individual's belief about his or her own political abilities), *Party Differential* (views of whether one party is better able to handle the individual's subjectively perceived most important problem), the *Strength of Party*

Identification, and level of *Trust in Government*. The election-specific attitudes are the perceived difference between the major party candidates and whether both candidates are perceived favorably. The general long-term predispositions are expected to be more closely related to registration, whereas the election-specific attitudes are expected to exert a stronger influence on the decision to vote among those registered.

The final set of factors included to distinguish among the electoral groups reflect the administrative barriers faced by individuals in their state. These two factors are the closing date to register and the number of years before individuals are purged from the books. These items were compiled for each election and merged with the individual-level data. In contrast to previous models, here it is conjectured that they should only influence the probability that individuals are registered, not whether they go to the polls once they are registered.⁷

Electoral Participation in the Full Electorate

The two-step selection bias model of the entire electorate is presented in Table 1, along with the traditional single model of turnout that compares all non-voters to voters (a discussion of the selection bias model is provided in Appendix B). In addition to this comparison, it is useful to compare the independent models of registration and turnout among the registered. As noted, the registration model is almost identical to the selection bias first stage and is thus not presented; the probit model and effect estimates for an independent model of turnout among the registered are provided in the Appendix B table.⁸

While some forces may be overlooked by the traditional operationalization, even those items considered important in past electoral models may not have provided a full understanding of how behavior is related to the two-stage process in the United States. While the results of the single model are sometimes interpreted as demonstrating various forces related to the acts of registering and turning out at the polls, without more sensitive analyses these can be no more than conjecture. The results shown in Table 1 demonstrate, however, that many of the items commonly included in electoral participation models only influence one of the

with the 1992 election, and studies validated before 1980 did not correct for those who were registered out of their district and may still have participated. Thus, the NES studies from 1980, 1984, and 1988 were pooled for analysis in this work. Dummy variables in models comparing 1984 and 1988 to 1980 were insignificant and were eliminated in the final models.

⁶ While length of residence in one's home is often discussed as an item tapping one's integration into the social milieu, recent work demonstrates it is a relatively weak indicator of social connectedness that continues to exert a strong effect on turnout, even after social connectedness is more directly controlled (Timpone n.d.).

⁷ While the closing date of registration will only affect those who need to register, the number of years before a state purges its records can be related to both the likelihood of being registered and the decision to vote once registered (Mitchell and Wlezien 1995). As Erikson (1981, 274) states, "one reason that people vote may be to stay registered." Thus, the number of years before purging would have a negative effect on going to the polls. Adding the purging variable to the turnout stage of the selection bias model for the full electorate had a negative but insignificant influence on turning out (first difference effect of .01). For comparability between models for the full electorate and recent movers, and due to this weak substantive effect, it is not included in the models presented here.

⁸ While the parameter estimates and substantive effects are almost identical for an independent registration model and the registration stage of the selection bias model, there are minor variations in the standard errors estimated from the independent probit and the bootstrapped selection bias model. Length of time in town is significant at the .05 level in the independent model but not in the selection bias model ($p = .09$).

TABLE 1. Pooled Turnout Models for Full Electorate, 1980–88

Note: The dependent variables in these models are *Validated Registration* and *Validated Vote*. The full sample size of 3,598 is composed of 954 nonregistrants, 343 registered nonvoters, and 2,301 voters. The administrative barriers were not included in the second stage of the selection bias model. * $p < .05$, ** $p < .01$. Standard errors are in parentheses (bootstrapped estimates for the selection bias models).

two stages. In fact, many of the conclusions resulting from traditional turnout models primarily reflect the relationships distinguishing between registrants and nonregistrants (Erikson 1981, Uhlaner 1989). By collapsing opposing influences in the two stages, it is not possible to disentangle where forces are exerted, and substantive relationships can be masked. This is clearly evident with race, which is neither substantively nor statistically significant in the traditional unitary model; once the process is disentangled, however, important relationships are revealed. Thus, if one is interested in fully understanding individual-level behavior, adequate specification of the structural process is clearly necessary.

Table 1 not only shows the usefulness of separating the acts of registering and going to the polls but also provides important information about the relationship between the two stages. The correlation between the two equations in the selection bias model is $-.355$, which is substantively meaningful, though modest and not statistically significant.⁹ A negative correlation sug-

gests that nonregistrants would be *more* likely to go to the polls, if they were eligible to do so, than those who are registered but did not vote.

In order to understand electoral behavior in the two stages, it is necessary to examine the effects of the forces in the model. Although the estimation procedure is more complex, the parameters can be treated as standard probit estimates. Because probit models are not linear and additive, the coefficients presented in Table 1 cannot be substantively compared, since the influence of each variable is dependent on the values of the others. Setting all other variables to their mean value (or base level for dichotomous variables) allows comparison of the effect of each variable on the probability of registering and voting (King 1989).

Table 2, which presents the relative effects of the

standard errors were more influenced by specification. While the correlation coefficients were insignificant in these fully specified models, in models with more constraints and fewer variables, they were of similar substantive magnitude (although slightly larger in some constrained models) but statistically significant. This further highlights the importance of conducting the selection bias estimation in less fully specified models.

⁹ While the fully specified selection bias models presented in the text are consistent with those run with more constraints, the correlation's

^aRepresents a dichotomous independent variable.

^bThe value of the age effect comes from the joint effect of changing both age variables in the model used to tap possible nonlinear effects.

variables, allows the forces in the models to be compared. Values of two standard deviations below and above the mean are used for comparability of the general range of the influence for each variable.¹⁰ The results presented in Table 2 show that the variables in the models generally distinguish between registrants and nonregistrants to a greater degree than between registered nonvoters and voters.¹¹ This is especially clear with a number of items emphasized in past models of turnout. Two factors considered important determinants of turnout, including its decline in recent decades, have been the strength of an individual's party identification and beliefs about the responsiveness of

the system reflected in the measure of external efficacy (Abramson and Aldrich 1982). As seen in tables 1 and 2, both forces are only significant, statistically and substantively, in the model for registration, not in the actual decision to go to the polls on election day. This is also the case with the other long-term political attitudes, as was expected.

For the most part, the registration model for the full electorate parallels the findings of the traditional single model. Clearly, as in the single model of turnout, the most influential force in distinguishing between registrants and nonregistrants is education. The next most influential is age. A number of other items also exert an important influence: region, church attendance, income, both ownership of and length of residence in one's home, and long-term political attitudes. Finally, the administrative items of closing date of registration and purging records are also significant determinants of registration, as would be expected.

The second stage of the selection bias model, distinguishing between registered nonvoters and voters, provides greater insight into the nature of electoral participation than does past work. As can be seen in Table 2, the forces influential at this stage generally have a smaller effect than those in the first stage, but the relationships are clearer than those revealed in previous research. The weaker effects are not surprising given the nonlinear estimation technique and the gen-

¹⁰ Several variables had skewed distributions, leading the value at two standard deviations from the mean to exceed the variable range. In these cases the value was set at the range endpoint.

¹¹ Table 2 presents the first-difference estimates, which provide the probability effects of changing the values of variables. While these are intuitive, caution must be used when comparing effects across the stages. This is due to the nonlinear nature of the likelihood functions and the fact that the base probabilities differ (i.e., the mean probability of a person voting once registered is higher than being registered). Using a derivative approach avoids this problem but is less intuitive than first differences (King 1989). While most influences are smaller in the second stage using derivative methods as well as first differences, the gaps are sometimes smaller, and in the case of church attendance they reverse. Thus, at the probability of .5, using the derivative approach, the influence of church attendance is greater in the turnout stage than in the registration stage (for both the full electorate and recent movers), and the effect of candidate differential is comparable in both stages for the full electorate.

erally high likelihood of turnout among registrants. One of the more influential items at this stage is race, which, as already noted, does not even approach standard levels of statistical significance in the single model. It has been argued that racial differences in turnout no longer exist once other factors are controlled, but this conclusion appears to be incorrect. The analyses presented here suggest that, during the 1980s, African Americans were less likely than others to go to the polls once they were registered, which supports the view that they lacked desirable choices in the general elections of this period (Tate 1993).

Other significant forces are candidate differential, region, marital status, and church attendance. Marital status operates differently from the other demographic and social connectedness factors in that it only influences the turnout stage. This is consistent with the idea that marriage has a "contagion" effect: Less interested and unlikely voters are spurred to the polls by a more involved spouse, since married couples tend to vote or abstain together (Stoker and Jennings 1995, Straits 1990).

Also notable in the turnout model is the smaller effect of education. Its influence on participation is overwhelmingly focused on the registration stage. Once the systematic relationship between the two stages is controlled, education as a factor in turnout is comparable to such factors as race and church attendance but fails to reach traditional levels of significance ($p = .070$).

It is also evident that the traditional unified approach may enhance relationships that run in the same direction in each stage but fail to attain significance in the finer analysis. This can be seen with the nonlinear relationship between age and participation. While age is among the factors with the largest substantive influence in both stages, the nonlinear term does not reach conventional levels of significance in either stage, whereas it is significant in the unitary model.¹² The connection between age and participation has been well investigated, and the source of the relationship has sparked some controversy (Miller and Shanks 1996, Teixeira 1992, Wolfinger and Rosenstone 1980). Figure 1, which plots the probability of participation by age for each stage of the selection bias model, shows that while age is monotonically related to being registered (over the normal life span), the nonlinear relationship is driven by the probability of going to the polls among registrants. In addition, the critical point occurs at a lower age in the finer analysis (58 years), once the effect of registration is separated, than in the traditional unitary model (75 years).

¹² The parameter for the age variable is significantly different from zero at the .001 level in the registration stage of the selection bias model, but it just misses conventional significance in the second stage ($p = .054$). As Figure 1 shows, the nonlinear relationship in the unitary model of turnout is mainly driven by the relationship in the second stage of the selection bias model (the parameter on age-squared in the second stage also approaches conventional levels of statistical significance at $p = .099$). Both the age and age-squared relationships are statistically significant in the independent model presented in Appendix B.

FIGURE 1. Influence of Age on Participation in the Full Electorate

Electoral Participation among Recent Movers

To this point it is clear that a number of forces distinguish among the three groups in the electorate, but the idea that this reflects decision calculi is a less tenable assumption. A problem with interpreting the above models as reflections of the underlying decision process is that, while the turnout decision is proximal to the surveys, the act of registering is likely to have occurred at some point in the (possibly distant) past. This is highlighted by the monotonically increasing likelihood of being registered over the life span, seen in Figure 1. Other research has shown that the causality between the behavioral forces in these models and participation is not simply unidirectional. Previous research focuses on the potential influence of participation on such attitudes as strength of party identification, beliefs about system responsiveness, and political interest (Brady, Verba, and Schlozman 1995; Converse 1969; Finkel 1985, 1987; Jennings and Markus 1984). While reciprocity between behavior and attitudes may be a "minor" dilemma when examining a decision proximal to measures of the "independent" factors, it becomes a serious concern when examining a behavior that may have occurred years or even decades before. Thus, closer scrutiny would be required for factors that may systematically change after one has registered, such as political interest, campaign attention, and a perceived difference between candidates.

To obtain a clearer picture of the relationship between the two-step institutional structure and individual voting behavior, the models estimated above were repeated with only the subsample of those who had moved in the past two years.¹³ This period avoids the potential problem of people registering before the

¹³ While all individuals who moved may not have reregistered, and some may have voted in their past precinct, this approach gives a cleaner portrait than the previous model of the determinants of both behavioral calculi. It also is the best proxy available for registration proximal to the survey as opposed to the more distant past. This is true despite the fact that movers, like survey respondents, are not a random subsample of the electorate, but these third- and fourth-stage selection bias issues are beyond the scope of this article (see Brehm 1993).

previous midterm election, thus not reflecting the specific election analyzed, and past work has determined that two years is the critical period for determining the influence of mobility on participation (Rosenstone and Wolfinger 1978; Squire, Wolfinger, and Glass 1987; Wolfinger and Rosenstone 1980). The single turnout and selection bias models for these recent movers are presented in Table 3.

As in the case with the entire electorate, separating the stages enhances our understanding of behavior.¹⁴

¹⁴ The correlation between the errors in the two models is also statistically insignificant and is substantively smaller for those individuals for whom both tasks are more immediate concerns than for the full electorate, $-.222$ compared to $-.355$, respectively. The general magnitude of the correlation among recent movers was even smaller in models with more constraints and never attained statistical significance. In all cases, the magnitude of the correlation was smaller among recent movers than for the full electorate. Thus, there may be less systematic variation among the unmeasured factors for those who have moved recently, and systematic differences may grow as individuals continue to participate or abstain over time. Rather than systematic alteration of the measured items, the differences could be due to the force of habituation of past decisions, consistent with the view of the inertial impetus of continued participation or abstention as self-reinforcing behavior (Brody 1980, Rosenstone and Hansen 1993).

This can be seen with gender, which is another example of a variable that behaves in the opposite direction in each stage. Thus, the null findings of the single model of turnout are the result of countervailing forces canceling each other out. When the two steps are taken into account, women who have moved in the past two years are less likely to register than men in the same situation; once women pass this threshold, however, they are more likely to go to the polls.

As with the model for the entire electorate, the parameter estimates cannot simply be compared to understand their influence. Estimates of effect were created for the recent mover models in the manner discussed previously, and these are presented in Table 4.

Overall, the registration model for recent movers is generally consistent with that for the entire electorate. There is substantial overlap in the findings of the two models, although several items gain greater influence among those needing to register at a time more proximal to the survey. Education, for instance, re-

^bThe value of the age effect comes from the joint effect of changing both age variables in the model used to tap possible nonlinear effects.

mains the most influential force in the registration decision; but the centrality of this factor for participation is even stronger among those who moved recently than in the electorate as a whole. This is consistent with past work demonstrating the influence of education in overcoming the hurdles of moving on participation (Squire, Wolfinger, and Glass 1987). Age and external efficacy also continue to exert a substantively important influence. The closing date of registration exerts an effect comparable to that of a number of other influential attributes in these decision models, such as region, length of residence in one's home, and church attendance. In addition, trust in government attains statistical significance among recent movers, that is, those *less trusting* were more likely to register once other forces are controlled.

Several differences are worth noting between the model of recent registrants and the full electorate in the turnout stage. Consistent with expectations, the single most influential force in bringing recent registrants to the polls is the perceived candidate differential. While this force also exerts an influence on the decision to register, it is central to the decision to vote. Although the effect has been inconsistent in some past studies, examining the two-stage process for those who register shortly before voting supports the intuitive notion that political competition is central to voting behavior (cf. Brody and Page 1973, Rosenstone and Hansen 1993, Weisberg and Grofman 1981). While

candidate differential is a significant determinant for both the full electorate and recent movers, the comparatively stronger influence in the second stage among the latter supports the idea of reciprocal causation for long-term residents; that is, those registered farther in the past grow to see greater differences as they participate more.

While church attendance exerts a strong influence on recent mover turnout, several other factors also deserve further investigation in the second stage. Region, marital status, race, and education are substantively related to turnout among registrants, although each fails to attain statistical significance in the selection bias model (p values of .053, .064, .144, and .146, respectively).¹⁵

Again, the unitary model generally combines the forces in the two stages. This masks some important factors, such as gender and race, whose effects are in the opposite direction in each stage, but it may accentuate the relationship of others. Marital status among recent movers, for example, does not attain statistical significance in either stage of the selection bias model; but in the single model, by combining the effects that

¹⁵ Again, comparison with the independent models in Appendix B is useful, particularly since the correlation between the errors in the two stages cannot be statistically distinguished from zero in this model. In the independent model of turnout among recent movers, region, marital status, and education attain statistical significance.

go in the same direction, its relationship with participation can be statistically distinguished from zero.

CONCLUSION

This study has shown that the distinct electoral groups clearly differ enough to warrant closer examination than they are generally given. By specifying analyses that accurately reflect the nature of structural relationships and that test for potential statistical biases, we can better understand individual-level behavior. The idea that the relationship between structure and behavior may be interactive is far from original or startling, but the implications for our models and understanding of voting behavior may be.

While a number of forces are known to be related to voter turnout, the present analyses provide an even finer portrait, such as the relationship between age and each stage of participation (refer to Figure 1). It is also clear that long-term predispositions are more closely tied to registration than to turnout. It was predicted that those with little general attachment to politics in the United States would be less likely to overcome the first hurdle, registration. While one would expect such factors as education, political efficacy (both external and internal), and strength of party identification to play a large role in registration, it is still surprising to see their effects so concentrated on the first stage. Furthermore, the differential effects between stages are not just due to short- and long-term predispositions. Length of residence in one's home has a substantial influence on registration, which is a function of both eligibility and the lesser role given to politics during important life changes, such as moving (Stoker and Jennings 1995). Other factors, such as marital status, further highlight how individual attributes interact with structural factors more broadly than is often conceived. While previous studies accurately found these forces to be related to electoral participation, they did not illuminate the important differences that exist due to the structural environment.

The approach employed here demonstrates that a number of participation variables considered unimportant or inconsistent in recent elections deserve closer examination. Some have argued that gender and racial differences in turnout largely disappear once other factors, such as socioeconomic status, are controlled. The analysis presented here shows that once the structural process of registration is taken into account, these factors are still significantly related to the participatory process in recent elections. When other factors are controlled, it appears that African Americans were more likely to register but less likely to go to the polls during the 1980s, possibly due to the candidate options available.¹⁶ In addition, it was seen that moving affects

men and women differently. While the registration barrier is more of a hindrance for women who have recently moved than men, females who overcome the barrier are more likely to vote than their male counterparts. This may be due to resources of finances, civic skills, and time, which have been shown to differ for men and women (Schlozman, Burns, and Verba 1994). In short, it is clear that the traditional unified model of participation has concealed the relationship of race and gender to voter turnout because the direction of the influence is different for each in the two stages.

Another insight concerns the relationship between trust in government and turnout. That relationship is generally thought to exist but often eludes researchers. An interesting finding of this study is that trust in government and satisfaction with both major party candidates may be consequential, but the direction of influence is opposite to what is generally expected. In the 1980s, it appears that discontent had a mobilizing effect on participation among recent movers, consistent with Eulau's (1956) view of a "politics of happiness."¹⁷ This warrants further study in light of the fact that both turnout and trust in government have declined since 1960, which raises the question of whether the relationship between the two may have changed in recent times.

Election-specific forces also were found to have a substantial influence on electoral participation in the United States, underscoring the importance of politics in the fundamental act of political participation. The greater the perceived difference between the candidates in the election, the greater are the benefits—instrumental and/or expressive—of participation. The findings raise interesting questions of whether this relationship is a combination of true mobilization in both stages and possible reciprocal causation between behavior and attitudes for long-time registrants. Whatever the case, the short-term mobilization effect of perceived candidate differences was clearly the primary determinant in whether recent movers who were registered went to the polls.

The distinctions that emerge between the full electorate and recent movers emphasize the utility of the paired analyses. While the primary interest of scholars is generally the full electorate, when studying behavior it is worth considering the processes for people performing the acts currently rather than in the (possibly distant) past. It was through the analyses of recent

¹⁶ The utility of distinguishing between influences at each stage of electoral participation can be seen in other ethnic groups in the United States as well. For instance, while Asian Americans tie with Latinos for the lowest rate of registration (53%), they are more likely than any other group to vote once registered. Thus, 76% of Asian Americans who were registered claimed to have voted in 1994, compared to 73% of whites, 64% of Latinos, and 63% of African

Americans (Ong and Nakanishi 1996). Citizenship and language explain part of the registration differences, but other factors influence the second stage of participation (United States Commission on Civil Rights 1992).

¹⁷ Eulau's (1956) discussion of the 1956 election involved a political landscape far different from ours. He viewed the way the game of politics was played then as a "happy people's politics." While this does not seem to reflect the present era, his comparative discussion is still insightful. He stated that "overpoliticization" was not necessarily an unmitigated good in other countries and that greater involvement may reflect that people are politically unhappy. This view is consistent with the finding in the 1980s that the less trustful and more politically dissatisfied were more likely to participate, while those more content were more likely to abstain (see also Hadley 1978, Weisberg and Grofman 1981).

movers, who had to register close to the election in order to participate, that a number of the interesting findings in this study were revealed, such as those dealing with gender, trust in government, and candidate differential.

While this study clarifies our understanding of individual-level behavior and structural requirements, it also raises a number of questions. In particular, what is the likely effect of easing registration requirements through the National Voter Registration Act of 1993? The NVRA (a.k.a. Motor Voter) was credited with registering millions of new voters for the 1996 election, and once fully implemented it will fundamentally alter registration in the United States.¹⁸ This will have implications for the level of turnout and its behavioral causes. Several key determinants of participation—particularly long-term political attitudes and education—play a much stronger role in the act of registration than in going to the polls. To some extent, the influence of these forces will be displaced to the second stage. Disinterested chronic nonparticipants are not likely to flood the polls simply because registration barriers diminish. I suspect that the displacement will be only partial, however. As de Tocqueville's "moment of national crisis" approaches, without the barrier of registration, a number of traditional abstainers are likely to go to the polls. Regardless of the NVRA's ultimate effects, this study has demonstrated that its implications may be more different than anticipated. The determinants of behavior at each stage are fairly distinct, and only by fully studying the operation of institutional forces can we understand how individuals will be influenced by such changes as the NVRA.

APPENDIX A: VARIABLES AND CODING

Demographics

South is a dichotomous variable coded one for individuals living in southern states and zero for all others. *Race* (black) is also a dichotomous variable coded one for African Americans and zero for all others. *Income* is in thousands of constant 1988 dollars. *Education* and *Length of Residence in One's Home* were coded in years. While *Age* was also coded in years, it was centered by subtracting the mean value to reduce collinearity between *Age* and *Age-squared*.

Items Tapping Social Connectedness

Church Attendance is a scale of the frequency of church attendance ranging from zero to one: 0 = never/no religious preference; .25 = a few times a year; .5 = once or twice a

month; .75 = almost every week; 1 = every week. *Group Membership* is a dichotomous variable coded one if the respondent is a member of any organizations that represent the groups to which s/he feels closest. *Marital Status* is coded one for respondents who are married and living with their spouse, zero otherwise. *Home Ownership* is a dichotomous variable coded one if the respondent is a homeowner; zero otherwise. *Length of Residence in One's Town* is coded in years.

Political Attitudes: General

External Efficacy is a scale ranging from zero (low) to one (high) combining responses to (level of agreement with) three items: "People like me don't have any say about what the government does"; "I don't think public officials care much what people like me think"; and the response to "Over the years, how much attention do you feel the government pays to what people think when it decides what to do?" Each item was scaled from zero to one (high efficacy), and the average of the items was used for the scale. *Internal Efficacy* is a scale from zero (low) to one (high) reflecting the level of agreement with "Sometimes politics and government seem so complicated that a person like me can't really understand what's going on." *Trust in Government* is a scale ranging from zero (low) to one (high) combining responses to four items: "How much of the time do you think you can trust the government in Washington to do what is right?"; "Do you think that people in government waste a lot of the money we pay in taxes, waste some of it, or don't waste very much of it?"; "Would you say the government is pretty much run by a few big interests looking out for themselves or that it is run for the benefit of all the people?"; and "Do you think that quite a few of the people running the government are crooked, not very many are, or do you think that hardly any of them are crooked?" The scale was created in the same manner as that for external efficacy by averaging the rescaled individual items (zero to one). *Party Differential* is a dichotomous variable coded one if the respondent feels that one party is more likely to do a better job dealing with the problem that the respondent perceives as the most important one facing the country. *Strength of Party Identification* is coded zero (independents and apoliticals), one (independents leaning toward a party), two (weak partisans), or three (strong partisans).

Political Attitudes: Election Specific

Candidate Differential is coded as the absolute value of the difference in values given to the two major party candidates on the 100-point thermometer scale. *Candidate Satisfaction* is a dichotomous variable coded one if both major party candidates are evaluated more than 50 on the thermometer scale, otherwise zero.

Administrative Barriers

The administrative variables were compiled from the *Book of States*. *Closing Date* is coded as the number of days before the general election that states close their books for registration; states with no registration requirements or election-day registration are set at zero. *Purging* is coded as the number of years of nonparticipation before a state removes an individual's name from the registration list. States that do not purge their books are set to a value of ten years, which represents the most liberal value for this period.

¹⁸ The League of Women Voters and Human SERVE credit Motor Voter with a net increase of 9 million registrants in its first 18 months, from January 1995 through June 1996 (Duskin 1997b). In the first two years, an estimated 28 million people used the law's provisions to register or update their records (Duskin 1997a). A number of reasons have been given for the decline in turnout in 1996, despite Motor Voter, such as lower involvement and interest, the campaign itself, decline in community, and the absence of the surge Perot inspired in 1992 (Woodwell 1997). Examining the behavioral change in the wake of the rule reforms will have implications for our general understanding of electoral behavior as well as the level of turnout.

APPENDIX B: SELECTION BIAS MODEL ESTIMATION

The selection bias models were estimated using the routine provided by SST. "The first equation (the selection equation) specifies which values of the dependent variable in the second equation are to be treated as uncensored. The second equation (the outcome equation) is estimated after correcting for selectivity bias" (Dubin and Rivers 1990, 127). The uncorrected independent probit models for the second stage are provided in Table B-1 for comparison. The Dubin and Rivers (1989/1990) routine provides a simplified optimization of the selection bias log-likelihood function:

$$L(\beta_1, \beta_2, \rho) = \sum y_{2i} (y_{1i} \log P_i(\beta_1, \beta_2, \rho) + (1 - y_{1i}) \log (Q_i(\beta_2) - P_i(\beta_1, \beta_2, \rho))) + (1 - y_{2i}) \log (1 - Q_i(\beta_2)).$$

In this case, y_{2i} is the selection variable (registration), and y_{1i} is the outcome variable (turnout at the polls). $Q_i(\beta_2)$ is the probability that an observation is not censored (that an individual is registered), and $P_i(\beta_1, \beta_2, \rho)$ is the probability of an "uncensored success" (an individual is registered and goes to the polls).

While the parameter estimates are robust, this estimation technique is sensitive to model specification and the starting values used to estimate the parameters (i.e., if the starting values are far off, the likelihood function does not converge).

The starting values for the estimation procedure were produced by estimating the two stages independently using the relevant samples—the entire electorate for registration, and only registrants for turnout. Readers may be concerned with the robustness of the selection bias models, since the only variables that distinguish between the two stages are a pair of highly aggregated administrative variables. Yet, selection bias models with more constraints (based on preliminary analysis and theoretic expectations) between the two stages were run, and the substantive conclusions about the nature of registration and turnout were quite consistent (these are available from the author on request). For completeness, anonymous reviewers recommended the presentation of the full models with only the administrative constraints. In theory this does not seem problematic, as the closing date of registration will clearly only influence registration, and purging also should have a stronger influence on the first stage. Placing the burden of identification on these aggregate variables does not appear to be a problem for the parameter estimation, as the models converged smoothly with stable parameter estimates (for both the more constrained models and those with only the administrative exclusions), and the substantive results are consistent across both approaches. Given the stability of these parameter estimates, the fuller models are presented here.

While the parameter estimates were quite robust, and one

TABLE B-1. Independent Probit Models and Estimated Effects for Turnout among Registrants, 1980–88

Note: The dependent variable in these models is validated vote. These are probit models of voter turnout for the censored sample of respondents who were validated as registered. The first column for each analysis has the probit coefficient estimates, the second their standard errors (in parentheses), and the third the estimated effects, which represent the change in probability of participating due to varying the value of each variable while holding the others constant.

^aRepresents the joint effect of age from shifting values for both age and age-squared at the same time.

* $p < .05$, ** $p < .01$. Standard errors in parentheses.

can be confident in the substantive conclusions drawn, the estimates for the standard errors were less stable in the selection bias models. I employed bootstrapping as an alternative to empirical estimation of standard errors in the selection bias models. Bootstrapping is based on the analogy that the observed data assume the role of an underlying population for repeated sampling (Stine 1989/1990). While bootstrapping is more computationally intensive, it has the advantage of allowing researchers to estimate sampling distributions directly without stringent assumptions often known to be implausible (Bartels and Brady 1993). Given the large number of variables in these fully specified models, few constraints between the two stages, and the relatively smaller size of the groups in the models for recent movers, about 20% of these bootstrapped samples did not converge smoothly, although the results are consistent with models with more constraints that did not have this problem. The standard errors for the selection bias models for the full electorate and recent movers are based on results from about 100 bootstrapped samples.

Strategy and Background in Congressional Campaigns

PATRICK J. SELLERS *Indiana University*

Common conceptions of the electoral connection often make two assumptions about the behavior of candidates and voters. The first is that candidates focus their campaigns on their records. The second is that voters evaluate candidates on the basis of their campaign messages. This article explores how candidates' backgrounds influence these two components of representation. The main premise is simple: Campaign messages are more effective if they emphasize issues on which candidates have built a record that appears favorable to voters. Consequently, candidates tend to focus on this type of issue when choosing campaign themes. Candidates are less successful in winning favorable evaluations if they stray from their records and make unsubstantiated claims.

Elections are central to American politics. Yet, despite extensive research into campaigns and elections, three central questions remain unresolved. First, do election campaigns follow any generalizable rules? Campaign practitioners often portray their strategy as more art than science. As one consultant put it, "in politics there are no rules" (Murphy 1995). Scholars have been more willing to generalize about campaign strategy and message selection.¹ They posit that candidates manipulate campaign agendas by emphasizing issue positions which voters evaluate favorably (Ansolabehere and Iyengar 1994, Downs 1958, Page 1978, Riker 1986) and that ambiguous messages help a candidate avoid voter dislike of specific policy positions (Shepsle 1972). Scholars, however, rarely test these competing theories with actual themes from campaigns.

A second question asks whether campaigns make a difference in the choices of individual voters. Although millions of dollars are spent in each election, political scientists have not yet discovered a systematic link between candidates' messages and voters' evaluations. Campaign effects are difficult to separate from voters' preexisting inclination to favor candidates from a particular party (Bartels 1992). More precise ways of measuring campaign messages and candidate evaluations offer hope for establishing campaign effects among individual voters (Alvarez 1996, Franklin 1991, Petrocik 1996, Westlye 1991, Zaller 1992).

If campaigns influence voters' choices, then a third question arises: Does this influence help voters make more informed choices? Critics charge that political advertisements distort candidates' positions, thereby deceiving voters. In response, political consultants point to the extensive information about candidates and their issue positions that campaigns provide. Significantly, the more favorable interpretation of campaign effects contains two important assumptions: that

candidates' messages accurately reflect their issue positions, and that voters consider these messages when choosing between candidates.

This article examines these questions in detail. I present evidence that campaign strategy does follow clearly identifiable rules and that campaigns affect individual voters' perceptions of candidates. Furthermore, this influence appears favorable: Candidates' messages reflect their record of issue positions, and voters seem to incorporate these messages into their evaluations of the candidates.

The arguments and evidence evolve from a simple premise: When choosing campaign themes, candidates tend to emphasize issues on which they have built a record that appears favorable to voters. This kind of message more effectively wins favorable evaluations from voters than messages lacking such a record. While this argument may appear self-evident, scholars have not fully explored the usefulness of candidate records in explaining political campaigns. The first section of the article explains how message selection and voters' evaluations may be influenced by two components of candidates' records: (1) the *extent* of a candidate's background on an issue and (2) whether that background suggests a *common interest* with voters. The next section develops measures of these two components, using the 1988 Senate Election Study (Miller et al. 1993). The third section uses these measures to predict the positive and negative campaign messages of the 1988 Senate candidates. The final analytical section compares these messages to voters' evaluations of the candidates.

CANDIDATE RECORDS IN CAMPAIGNS

The interaction of voters and candidates resembles the principal-agent relationship developed by economists (Ferejohn 1990). As principals, voters choose a candidate and delegate to this agent the responsibility for representing their interests in government. The principal-agent relationship is plagued by hidden information and opportunism. When deciding whether to hire an agent, the principal cannot observe the agent's skills and preferences until after the hiring decision has been made. In addition, the agent has an incentive to overstate her qualifications and misstate her prefer-

Patrick J. Sellers is Assistant Professor of Political Science, Indiana University, Bloomington, IN 47405.

For research assistance, I thank Patrick Brandt, Scott McClurg, and particularly David Holian. For useful suggestions, I thank John Aldrich, Bill Bianco, John Brehm, David Canon, Ted Carmines, Kathryn Firmin-Sellers, Paul Gronke, Bob Huckfeldt, Tom Kazee, Arthur Lupia, Burt Monroe, Cliff Morgan, Emerson Niou, Leroy Rieselbach, John Williams, Rick Wilson, Jerry Wright, and three anonymous reviewers. All results were calculated using Stata 5.0.

ences in order to increase the likelihood of winning the position (Kiewiet and McCubbins 1991).

The principal can overcome these obstacles by focusing on properties of the agent that reliably indicate the agent's qualifications or preferences (Spence 1974). Some of these properties may be outside the agent's control, such as age or gender. The agent may expend time and resources to acquire other properties, such as education or experience. These properties may indicate expertise in a specific area. These properties may also signal an agent's preferences, in terms of commitment to a particular policy position. By deriving expectations of expertise or policy commitment from these properties, a principal can better predict whether a potential agent will produce desired results if hired.

Voters and candidates face similar obstacles and solutions in campaigns. As principals, voters may find it difficult to determine the skills and preferences of competing candidates. These potential agents have an incentive to exaggerate their attractiveness to voters. Aware of this incentive, voters may discount candidate statements as "political" and therefore inaccurate (Hinich and Munger 1992). When attempting to overcome these obstacles, voters and candidates may turn to the solution outlined above: They may focus on properties of the agent that reliably indicate qualifications or preferences (Iyengar et al. 1997). In campaigns, candidates often turn to their record to bolster their message. After devoting time and resources to developing a record on a particular issue, a candidate can use that record to convince voters that she is qualified and shares their interests.

Many scholars believe that incumbent legislators use their records to build a representational link with constituents. To support this belief, many models compare constituent opinion to incumbents' records, either on a specific issue or across a diverse set of roll call votes summarizing the legislator's "ideology." Correspondence between the two measures is interpreted as evidence of representation; that is, the principals (the constituents) have successfully selected an agent (the legislator). Such a linkage theoretically produces favorable evaluations for the legislator. This analytical framework is inherently limited, however (Bianco 1994, Jackson and Kingdon 1992). If the candidate's general ideology (as indicated by roll call votes or some other measure) is attractive to voters, then the candidate may emphasize it in campaign messages. But if the ideology is unattractive, then the candidate may instead highlight her record on more specific issues that generate more favorable evaluations. In the latter case, a comparison of the candidate and the voters may find little or no link between the two. A linkage may exist, however, on the issues that the candidate emphasized to voters.

The problem is magnified by the varying extent of candidates' records on different issues (Fenno 1996). One legislator may have developed a prominent ideological record as leader of the Conservative Opportunity Society. Another may have cast equally conservative roll call votes but may have focused her time and energy on building a record of increasing defense

spending. When communicating with constituents, each legislator may emphasize the issue on which she has developed an extensive record. When every candidate's record on a single issue is compared to voters' preferences and evaluations, the evidence of a linkage may be weak. Instead, voters' evaluations of each legislator may hinge on different issues.

These examples point to two components of a candidate's record on a particular issue: common interest and extent of background. The former captures whether the candidate's record suggests an issue position close to that of the voter. But common interest presumes that the candidate actually has developed a record on the issue. If not, then the candidate's claims on the issue may not attract a voter's support. A claim supported by background information may be more effective.

This increased effectiveness may occur for at least two reasons. First, the candidate's record may indicate that she has developed extensive expertise on a particular issue. If the record also suggests that the candidate and a voter share a common interest on the issue, then the voter may trust the candidate and be swayed by the candidate on that issue (Lupia and McCubbins 1995). Imagine two congressional districts heavily dependent upon farming. One is represented by a freshman legislator, while the other has repeatedly reelected a senior member of the House Agriculture Committee. Both legislators have cast votes in favor of farming interests. But the second incumbent's lengthy record of committee activity suggests that she has developed extensive expertise on agricultural issues. As a result, this incumbent's campaign messages involving farming and her record on the issue may more effectively win favorable evaluations from voters. Constituents are more likely to support an expert who shares their position than a candidate who simply states the same position.

Second, background-supported messages may be more effective because a candidate's record may indicate a history of commitment to a particular issue and position. If that record of commitment also suggests a common interest with voters, the candidate may effectively influence voters' evaluations by emphasizing the issue and record. In the 1988 New Hampshire presidential primary, George Bush successfully rebuffed a challenge from Robert Dole. A central part of Bush's strategy was to emphasize his record of opposing tax increases. Both candidates claimed similar positions on the issue. But, Bush claimed that his record indicated greater commitment to the position, and that he therefore would be less likely to raise taxes if elected president (Aldrich and Alvarez 1994).

In sum, the common interest and extent of a candidate's record on an issue may influence the effectiveness of her claims on that issue. This argument suggests several predictions about candidates and voters. If both components are present in a candidate's record on an issue, then the candidate is likely to offer a positive message (about herself) on the issue. If a candidate's opponent possesses a record on the issue that indicates a lack of common interest with voters, then the candi-

date is likely to attack the opponent on the issue. On the level of individual voters, a candidate's positive messages are more likely to influence the voters' evaluations if those messages are supported by background information indicating common interest with the voter. A candidate's attacks on an opponent also will be more effective if they emphasize issues on which the opponent's record suggests a lack of common interest with voters.

These predictions identify particular campaign messages that are likely to be selected. Yet, other factors may mediate the importance of background, leading candidates to deviate from these predictions. One such factor is the competitiveness of a candidate (Skaperdas and Grofman 1995). On the one hand, candidates who are favored in an election may be more likely to offer positive messages about themselves and less likely to attack an opponent. They work to maximize their own support and avoid giving a weaker opponent any publicity. On the other hand, candidates considered likely losers resort to extensive attacks on their opponent in an attempt to weaken her electoral base. These considerations may lead candidates to ignore the logic of message selection based on their backgrounds.

Candidates' choices of message may also hinge on issue ownership (Ansolabehere and Iyengar 1994, Petrocik 1996). According to this explanation, the two major parties "own" certain issues. They have a lengthy record of accomplishment in these areas, and their core constituencies are strongly concerned about them. As a result, candidates' messages on their party's issues will more successfully influence voters' evaluations. This advantage leads candidates to campaign on issues owned by their party.

These two alternative theories also generate unique predictions about candidates' selection of campaign messages. Before comparing these predictions to those based on the candidates' records, I must first develop measures of those records. The next section develops measures of extent of background and common interest for Senate candidates in 1988.

MEASURING CANDIDATES' RECORDS

Candidates build records across an array of issues. It is difficult to define the set of possible issues underlying those records. Defense spending, for example, may overlap with foreign policy. Either category may cover attempts to fund the Strategic Defense Initiative. To overcome this difficulty, I used two sources to define the set of possible issues for this analysis. First, the National Election Study regularly compiles a list of issues mentioned by respondents as frequently discussed in the recent election campaign. Second, the contextual data set in the 1988 Senate Election Study (Miller et al. 1993) lists the issues emphasized by the Senate candidates that year. These two sources provided a comprehensive list, which I combined into 27 possible issues that may be discussed in a congressional campaign.¹

¹ The issues are: abortion, child care, consumer interests/government

My research assistant David Holian and I coded each candidate's record on each issue. For evidence on candidate's backgrounds, we turned to several sources: *The Almanac of American Politics* (the editions before and after the 1988 election); *Politics in America* (before and after the election); and the summaries of each campaign in *Congressional Quarterly Weekly Report*, published in February and October of each election year. Using information from these sources, we first coded the extent to which each candidate had developed a public record on a particular issue. Some candidates have built extensive records through committee work, the introduction of legislation, or a prior occupation. Examples include Daniel Patrick Moynihan's (D-NY) lengthy legislative record on welfare and poverty and Joseph Lieberman's (D-CT) efforts to fight crime while attorney general of Connecticut. These candidates were assigned a 2 for their record on the relevant issue.

Other candidates have taken prominent action on a particular issue but only by casting a roll call vote. Pete Wilson (R-CA), for example, was wheeled to the floor of the Senate hours after an appendectomy to help win a close budget vote (Barone and Ujifusa 1987, 76). If the election summaries mentioned that a candidate had cast this type of prominent vote, then she was assigned a 1 on the relevant issue.² If the summaries mentioned no public activity on an issue, we assigned a 0 to the candidate on that issue.³

We also coded the level of common interest for each candidate and issue. This measure captured whether the candidate's prior activity on the issue indicated a position that would be supported by the electorate in the candidate's state. First, we coded whether the prior activity indicated a liberal position, a conservative position, or no position at all on that issue. Second, I determined whether a state's electorate tended to be liberal or conservative, using the measure of state

regulation, crime/drugs, defense spending, education, environment, farming, federal spending/pork, foreign policy, general moral/social issues, government corruption, government management of the economy, health care, homosexual rights, immigration, individual economic concerns, macroeconomic concerns, negative campaigning, party/ideology, personal scandal, personal strengths, presidential candidates, race, trade, welfare/poverty, and women's rights. The determination of these 27 issues is arbitrary, and others have chosen substantially different classifications (Clausen 1973, Miller 1990, Page and Shapiro 1992). Certain personal characteristics, such as physical attractiveness, also may influence message effectiveness and voters' evaluations. These characteristics are omitted because of the difficulty of measuring them. I ran the models using various combinations of the 27 issues. The results were always equivalent to, and usually stronger than, the results reported below.

² In their descriptions of each legislator, *The Almanac of American Politics* and *Politics in America* include the legislator's position on "Key Votes" during the congressional term. We excluded these roll call votes from the coding, since they are provided for every legislator, regardless of each vote's importance for each legislator.

³ In the message selection model below, it appears important to assign different values to roll call votes and from more resource-intensive activities, such as introducing legislation. The model was reestimated with the two combined and with roll call votes categorized as nonactivities. Both reestimations produced weaker results than those reported here, which use the 0-1-2 coding scheme for the extent of candidates' records.

ideology in the Senate Election Study contextual data set.⁴ Third, I compared the state electorate's ideology to a candidate's position on an issue. If the two were both liberal or both conservative, then I assigned a value of 2 to the common interest measure for that candidate and issue. If the two were opposite, then I assigned a -2. Lack of a record meant that it was not possible to determine whether the candidate shared the electorate's interests on the issue. Here I assigned a value of 0. In a limited number of cases, a portion of the candidate's activities suggested a liberal position, while other activities suggested a conservative position. I also assigned a value of 0 to these cases.⁵

The measure of common interest is admittedly problematic. It is difficult to categorize a state's electorate as simply liberal or conservative, given the variation among voters in any state. In addition, all 27 issues do not fit easily on a liberal-conservative continuum. A particular position may be viewed as liberal in some states and conservative in others. I attempted to obtain better indicators of each state electorate's opinions on the 27 issues. Research assistants contacted polling organizations in the 33 states that held Senate elections in 1988. After 144 telephone calls to 54 individuals and organizations, they accumulated the summary frequencies for 176 statewide polls taken in 1987 or 1988. (Data for individual respondents were available for only a fraction of the polls.) Despite the comprehensiveness of the search, the polls still addressed only a fraction of the possible issues across the states. In light of the limited statewide survey data, I used the summaries of state ideology described above. These summaries are admittedly noisy proxies for state electorates' opinions. But, their imprecise nature makes it more difficult to find a significant relationship between the background measures and message selection.⁶

The coding process produced measures of extent of background and common interest on the 27 issues.⁷

⁴ States were coded as liberal if their ideological rating was greater than the average ideological rating for all 50 states. Conservative states had an ideological rating below the overall average. Jerry Wright compiled the measure of state ideology, using CBS/*New York Times* polls from 1976 to 1985 (Miller et al. 1993).

⁵ Several of the 27 issues are valence issues, in that a single position is most favorable regardless of state ideology. For example, all voters prefer candidates who avoid a personal scandal, such as absenteeism. For valence issues, we compared a candidate's prior activity on an issue (if any activity existed) to the favored position. We assigned a 2 if the two were consistent, a -2 if inconsistent, and a 0 if the candidate lacked a record of activity on the issue. Note that the coding for valence issues does not require comparison to state ideology. But for both valence and nonvalence issues, positive (negative) values indicate the presence (absence) of common interest between the candidate's record and the state electorate.

⁶ I also examined the message and background variables only for valence issues, for which the most favorable position (and therefore common interest) is easy to determine (see note 5). When applied to these issues, the message and background variables were related in ways similar to the patterns reported below.

⁷ Before coding the 1988 Senate candidates, the research assistant and I practiced coding the records of 60 House candidates in 1988. We both then coded the 1988 Senate candidates. For 91.81% of the candidates and issues, we chose the same code for extent of candidate background. Our agreement on candidate positions was 81.88%. The coding discrepancies fell into two categories: oversight

TABLE 1. Mean Background Measures, by Candidate Type

Type of Candidate	Extent of Background	Common Interest	Number of Cases
Incumbent	.81	.22	729
Incumbent challenger	.22	-.01	729
Candidate for open seat	.44	.06	324

Note: The measure of extent of background ranges from 0 (candidate lacks record on the issue) to 2 (candidate possesses extensive record on the issue). The common interest measure has a minimum of -2 (candidate's record on the issue suggests a lack of common interest with the state's electorate) and a maximum of 2 (candidate's record indicates common interest with the state electorate).

Sixty-six major party candidates ran in the 1988 Senate races. As a result, each measure of candidate record has 1,782 observations, one for each candidate on each issue. Table 1 presents the averages of the two measures for different types of candidates. In the first column the averages for extent of background are calculated from the candidates' ratings across the 27 possible issues. None of the candidates had developed a record on all the issues; the most prolific incumbent was Ted Kennedy (D-MA), a legislative workhorse with a record on 16 issues. Given these patterns in the data, it is not surprising that the extent of background averages in Table 1 are closer to the minimum of 0 than the maximum of 2. The averages also vary in understandable ways across different types of candidates. Incumbents have built more extensive backgrounds than their opponents (.81 versus .22). The average candidates in races for open seats fall between these two extremes. Such variation reflects the tendency of races for open seats to attract higher quality challengers than incumbent races (Canon 1993, Jacobson 1997).

Similar differences appear in the averages for the common interest measure, reported in the second column of Table 1. Here, a candidate might receive a maximum of 2 and a minimum of -2, denoting, respectively, the existence and absence of common interest with voters on a particular issue. The averages for this measure are even closer to 0, reflecting the candidates' negative values on some issues. Incumbents' records indicate the greatest common interest with their state, while challengers' backgrounds suggest lower levels of common interest (.22 versus -.01). The average for candidates in races for open seats fall between these two values. The differences provide further evidence of the higher quality challengers in these contests relative to incumbent races.

The low quality of challengers to incumbents often

of an aspect of the record (e.g., one of us would miss that a candidate had led legislative efforts to overturn the Endangered Species Act) and disagreement about how to code a particular activity (e.g., one of us would code the introduction of Strategic Defense Initiative legislation under defense spending, and the other would place it under foreign policy). We corrected the oversights regarding candidate activities. We resolved disagreements by placing the problematic activity under a particular issue and coding the activity the same if it subsequently appeared in other candidates' records. The models here use the corrected version of the coding.

has been traced to incumbent advantages, such as franking privileges and greater fundraising ability. Table 1 points to an additional advantage that is often ignored. Sitting legislators have more opportunities to develop records on issues that arise in congressional campaigns, which may help them offer more effective messages on those issues. If more extensive records confer such an advantage, then candidates will choose campaign messages with their records in mind. The next section uses the background measures to test this assertion.

THE SELECTION OF CAMPAIGN MESSAGES

When candidates prepare for an upcoming campaign, they select a set of messages to emphasize during the coming months. While short-term tactical considerations may lead to deviations from this strategic plan, a goal of all candidates and their handlers is to "stay on message" (Franklin 1996). I argue that the strategic plan is based on a candidate's record and that of her opponent. The candidate searches for issues on which her record supports claims that will win favorable evaluations from voters. Consequently, if the candidate has a record on an issue that reflects the preferences of the state's electorate, then she is likely to offer a positive message on that issue. Similarly, the candidate also searches for issues on which her opponent's record supports claims that will encourage unfavorable evaluations of the opponent among voters. If the opponent possesses a record that indicates a lack of common interest, then the candidate is likely to attack the opponent on that issue.

I examined these hypotheses using the Senate Election Study list of issues on which the Senate candidates offered positive and negative messages. The dependent variable is the type of message offered by a candidate on an issue: positive, negative, both, or none at all. With 66 candidates and 27 possible issues, the data set has 1,782 observations. The model includes six independent variables capturing the candidates' backgrounds. The first two are summarized in Table 1: the extent of a candidate's record on a particular issue and the common interest suggested by that record. The third variable is the interaction of the extent of background and common interest measures. Simply expressing a favorable position on an issue may be insufficient to make an effective claim on the issue. The most effective messages may require a background that supports the claim of common interest. Finally, three variables capture the background characteristics of the candidate's opponent and are likely to affect the probability of attacking that opponent.

In addition to the variables capturing candidates' backgrounds, I included independent variables for two alternative theories of message selection. Specifically, to operationalize the competitiveness theory (Skaperdas and Grofman 1995), I used the seven-point rating of each campaign in *Congressional Quarterly Weekly Report*, published in early October 1988. It rated whether the Democrat or Republican was more likely

to win. I recoded the measure to capture each candidate's competitiveness. The new measure ranges from 0 (little chance of winning) to 6 (very likely to win).⁸ It is important to consider the range of the competitiveness variable for different types of candidates. In 1988 all but two incumbents received (recoded) competitiveness ratings of 4 or higher. Likewise, all but two incumbent challengers had ratings of 2 or lower. Since the *Congressional Quarterly Weekly Report* measure has a different range for different types of candidates, any estimates of this variable's effect may capture differences between the types of candidates instead of the effects of competitiveness. To control for this mediating effect, I created two dummy variables, one for incumbents and one for challengers to incumbents. The excluded category, therefore, captures the candidates for open seats, of which there were six in 1988. I then interacted each of the dummy variables with the competitiveness ratings. For incumbents, the interaction term largely ranges from 4 to 6. For most of the challengers, it ranges from 0 to 2. In this manner, the interaction terms place variation in competitiveness on more comparable scales across types of candidates.

I operationalized the issue ownership theory (Ansolabehere and Iyengar 1994, Petrocik 1996) with a series of dummy variables. The first classifies a candidate as Republican (1) or Democratic (-1). Two additional dummy variables designate whether an issue is Democratic and whether it is Republican. The categorization of specific issues follows the coding of Petrocik (1996).⁹ These three variables jointly capture whether a particular issue is owned by a candidate's party.

A Test of Message Selection Theories

All three theories of message selection may explain a candidate's decision to offer a positive message on an issue, a negative one, both, or neither. Consequently, I estimate the following model:

$$\begin{aligned} \text{Prob}(Y_{ij} = k) / \text{Prob}(Y_{ij} = m) = & \alpha_k \\ & + \beta_{1k} (\text{Background}) + \beta_{2k} (\text{Competitiveness}) \\ & + \beta_{3k} (\text{Issue ownership}) + \varepsilon_{ijk}, \end{aligned}$$

where i represents a candidate, j represents an issue, k and m represent message choices, and ε_{ijk} is an independently distributed stochastic term. Since the four possible message choices are unordered and noncontinuous categories, I estimate the model using unor-

⁸ The Senate Election Study provides other ratings of competitiveness, some of which were compiled more than five months before the election. I reestimated the model below with these alternative measures of competitiveness. The estimated patterns of message selection did not change.

⁹ The following issues were assigned to the Democratic Party: child care, education, farming, health care, racial issues, welfare/poverty, and women's rights. Defense spending, government management, and moral/social issues were assigned to the Republican Party. A number of issues, such as abortion, were not easily classified using Petrocik's framework. Several others, such as macroeconomic concerns, were performance issues. Neither of these latter types of issues were assigned to the parties.

TABLE 2. Unordered Logit Model of Candidates' Message Selection

Independent Variable	Pr(positive message)/ Pr(no message)	Pr(negative message)/ Pr(no message)	Pr(positive and negative message)/ Pr(no message)
Constant	-1.92*** (.32)	-2.15*** (.34)	-3.46*** (.52)
Candidate's background			
Extent	.47*** (.10)	.18 (.12)	.45** (.16)
Common interest	.005 (.64)	-1.09 (.87)	-.93 (1.25)
Extent × common interest	.06 (.33)	.37 (.44)	.50 (.64)
Opponent's background			
Extent	.09 (.10)	.47*** (.10)	.09 (.17)
Common interest	.78 (.65)	1.40* (.59)	-2.11* (.90)
Extent × common interest	-.32 (.33)	-.88** (.30)	1.07* (.48)
Competitiveness	-.06 (.09)	-.04 (.10)	-.16 (.14)
Incumbent	1.05 (.56)	1.04 (.61)	2.20** (.82)
Challenger to incumbent	-.62 (.35)	-.75* (.37)	-1.14* (.55)
Competitiveness × incumbent	-.32* (.13)	-.42** (.15)	-.69** (.21)
Competitiveness × challenger to incumbent	.07 (.14)	.44** (.13)	.38 (.20)
Candidate party	-.09 (.10)	.21 (.12)	.33 (.28)
Issue owned by Democrats	.78** (.23)	.06 (.33)	3.23*** (.49)
Issue owned by Republicans	.54 (.33)	.72* (.33)	1.33** (.49)

Note: Entries are maximum likelihood estimates. Standard errors are in parentheses. $N = 1,782$. $\chi^2 = 318.35***$. Correctly predicted = 77%. * $p < .05$; ** $p < .01$; *** $p < .001$.

dered logit. The resulting estimation produces three equations, which are reported in Table 2. In each equation, each coefficient represents the effect of a particular variable on the probability of selecting a particular message type, relative to the probability of the baseline type.¹⁰ Overall, the model explains a substantial portion of the variation in message selection. It correctly predicts approximately 77% of the 1,782 choices made by the candidates. The predictive power suggests that message selection does follow

¹⁰ In the multinomial logit model, the baseline category is choosing no message. The multinomial model requires that the odds ratio for any two alternatives be independent of the probabilities of choosing the other alternatives (independent of irrelevant alternatives). This condition may be violated if expansion or contraction of the choice set affects the odds ratio of any two alternatives. In the model presented here, the choice set is unlikely to change. When deciding which type of message to offer, a candidate can always choose from positive messages, negative messages, both, or neither. The data appear to support this assumption. The estimates reported below are relatively stable when the alternatives in the choice set are sequentially omitted (Maddala 1983). I reestimated the unordered logit model four times, omitting one of the choices each time. I then compared the new coefficients to those of the original model. The coefficients never varied by more than one standard error.

generalizable rules, even if campaign consultants do not always consciously articulate them.

Each group of variables makes a significant contribution to the model.¹¹ While it is difficult to interpret individual coefficients directly, the results in Table 2 do suggest a number of conclusions supporting the main arguments of this article. The first equation compares the probability of a positive message to that of no message. The only significant background variable is the extent of the candidate's background. The likelihood of a positive message appears to hinge on the background of the candidate (and not that of her opponent). The second equation compares the likelihood of a negative message to that of no messages.

¹¹ In χ^2 tests for total contribution of each theory's variables, it is necessary to calculate the difference between -2 times the log likelihood of the constrained model (estimated without the relevant variables), and -2 times the log likelihood of the unconstrained model. The χ^2 for each group of variables is as follows: competitiveness (106.84, with 15 degrees of freedom), issue ownership (113.92, with 6 d.f.), and background (119.32, with 9 d.f.). These results should be interpreted cautiously, since the test is more likely to produce significant joint effects as the sample size increases (Aldrich and Alvarez 1994, Maddala 1983).

TABLE 3. Estimated Probability of Choosing Messages, by Candidate and Issue Characteristics

Candidate or Issue Characteristic	Candidate's Message Choice			
	No Message	Positive Message	Negative Message	Positive and Negative Messages
Competitiveness				
Incumbent				
Competitive	.72	.16	.09	.03
Safe	.91	.06	.03	.00
Incumbent challenger				
Competitive	.70	.09	.18	.03
Losing	.81	.10	.07	.02
Candidate for open seat				
Competitive	.72	.14	.11	.03
Losing	.68	.16	.12	.04
Party ownership of issues				
Democratic candidate				
Issue not owned by Democratic Party	.76	.12	.10	.02
Issue owned by Democratic Party	.53	.19	.08	.20
Republican candidate				
Issue not owned by Republican Party	.73	.10	.15	.02
Issue owned by Republican Party	.57	.13	.24	.06

Note: The probabilities were calculated using the coefficients in Table 2. Each probability represents the estimated likelihood that a candidate will choose the particular type of message (positive, negative, and so on), given the level of competitiveness or party ownership of the issue. For the probabilities related to competitiveness, all variables other than those involving competitiveness were held at their means. For the competitive incumbent probabilities, I assigned a 1 to the incumbent dummy variable, a 0 to the incumbent challenger variable, and a 3 to the competitiveness variable. The remaining probabilities relating to competitiveness were calculated in a similar manner. For the probabilities related to issue ownership, all variables other than the party ownership variables were held at their means. For probabilities related to a Democratic candidate, I assigned -1 to the candidate party variable. I assigned a 0 to the Democratic ownership variable for the probabilities when the issue was not owned by the Democrats. I assigned a 1 when the issue was owned by the Democrats. In both cases, I assigned a 0 to the Republican ownership variable. I followed a similar procedure for probabilities related to Republican issue ownership.

Here, only the background variables for the candidate's opponent produce coefficients that are individually significant. The background of the candidate's opponent (and not that of the candidate) influences the likelihood of a negative attack. In the third equation, the backgrounds of the candidate and her opponent influence the probability of offering both a positive and negative message, compared to the likelihood of offering no message. These patterns are consistent with the theoretical predictions.

The predictions can be evaluated in greater detail by calculating the estimated effects of the three groups of variables on the candidates' choice of messages. As can be seen from the estimated probabilities in Table 3, competitiveness appears to influence the candidates' selection of messages, but not in the manner expected. According to the theory, positive messages are expected to grow more likely as incumbents move from a competitive race (CQ rating = 3) to a safe one (rating = 6). Instead, the estimated probability of a positive message decreases from .16 to .06. A symmetric result occurs for incumbent challengers. The theory predicts that they grow more likely to offer a negative message as they move from a competitive race (rating = 3) to a losing one (rating = 0). Here, the likelihood of a negative message actually falls from .18 to .07. In uncompetitive races, incumbents and challengers appear to offer few messages of any type. In more competitive races, both candidates make more campaign claims. These patterns do not extend to races for open seats, perhaps because these contests are more uniformly competitive.

Among the other theories, party ownership of issues appears to exert a strong influence on message selection. When issues are not owned by the Democratic Party, candidates from that party have a probability of .76 of offering no message, or a probability of .24 of offering any type of message (positive, negative, or both). The probability of any type of message jumps to .47 on issues owned by the Democrats. When issues are not owned by the Republicans, candidates from the GOP have a probability of .27 of offering any message. This value rises to .43 on issues owned by the Republican Party. Candidates appear to tilt their selection of messages toward issues owned by their party.

In addition to predicting which issues will be emphasized, it is helpful to know whether candidates will offer positive or negative messages on those issues. The theory based on candidates' backgrounds proves useful with both types of predictions. Table 4 presents the estimated probabilities of offering various messages for different types of candidate backgrounds. The probability of a candidate choosing "no message" on a particular issue always is at least .54. This pattern indicates that most candidates offer messages on few of the 27 issues. Indeed, the mean number of positive messages per candidate is 3.79, while that for negative messages is 3.24. Despite these low averages, the variation in message selection is linked to the candidates' backgrounds.

Consider positive messages, in which a candidate offers a message about herself. If a candidate possesses no background on an issue, the probability of offering a positive message on that issue is .10. This probability

TABLE 4. Estimated Probability of Choosing Messages, by Background Characteristics

Extent of Candidate's Background	Candidate's Common Interest	Candidate's Message Choice			
		No Message	Positive Message	Negative Message	Positive and Negative Messages
Lacks background	No clear position	.74	.10	.13	.03
Possesses background	No clear position	.60	.21	.15	.04
Possesses background	Common interest	.60	.26	.08	.06
Possesses background	Lack of common interest	.55	.15	.26	.04

Extent of Candidate's Opponent's Background	Candidate's Opponent's Common Interest	Candidate's Message Choice			
		No Message	Positive Message	Negative Message	Positive and Negative Messages
Lacks background	No clear position	.76	.12	.09	.03
Possesses background	No clear position	.64	.12	.20	.04
Possesses background	Common interest	.69	.17	.11	.03
Possesses background	Lack of common interest	.54	.08	.36	.02

Note: The probabilities were calculated using the coefficients in Table 2. When calculating the probabilities in the upper half of the table, all variables other than the candidate's background variables were held at their means. For the four probabilities in which a candidate lacks background and position, I assigned a value of 0 to the relevant extent of background and common interest variables. For the four probabilities in which the candidate possesses background but lacks a clear position, I assigned 2 and 0 to the extent of background and common interest variables, respectively. For the probabilities in which the candidate's background indicates common interest, I assigned a 2 to both the extent of background and common interest variables. For the probabilities in which the candidate's background indicates a lack of common interest, I assigned a 2 and -2 to the extent of background and common interest variables, respectively. The probabilities in the lower half of the table were calculated in a similar manner, except that I used the candidate's opponent's background variables, rather than those of the candidate.

risers substantially if the candidate possesses a record on the issue. If that record does not indicate a clear position, the probability of a positive message rises to .21. A record indicating common interest raises the likelihood of a positive message to .26. As might be expected, candidates are less likely to offer a positive message if their record indicates a lack of common interest (.15).

Negative messages targeting a candidate's opponent appear even more closely related to background (of the opponent, in this case). If the candidate's opponent lacks a record on an issue, the probability is .09 that the candidate will attack the opponent on that issue. The probability rises if the opponent has developed a record on the issue. An opponent's record indicating no clear position boosts the likelihood of attacking that opponent to .20. A record suggesting a lack of common interest raises the probability of a negative message to .36. Candidates are more likely to attack if the opponent's record indicates a lack of common interest.

Candidates' records thus appear to influence their choice of campaign messages. The tests of all three theories provide insights into candidates' choices. But the explanation based on background and common interest appears more powerful in explaining the variation in candidates' positive and negative messages. The influence of background is stronger for negative than positive messages, even though candidates offer, on average, more positive than negative messages. Attack advertising has grown more pervasive in recent elections (Jacobson 1997), and candidates increasingly debate the validity and accuracy of their attacks on each other. As a result, voters and political observers may view negative messages more dubiously, particularly compared to positive ones. This critical attitude may make candidates hesitate to attack their opponents unless they can validate the charges with information from an opponent's record. At the same time,

candidates may choose to offer positive messages about themselves, unsupported by background information. These messages are less likely to attract questions about accuracy or validity.

MESSAGES, BACKGROUND, AND INDIVIDUAL VOTERS

The analysis thus far has focused on the activities of candidates, illustrating how they often emphasize issues on which they (or their opponent) have developed a record. Such a finding provides initial support for the favorable interpretation of campaigns offered in the introduction of this article. But the argument and evidence may still be dismissed as irrelevant unless it can be demonstrated that the background-related messages actually affect electoral outcomes. This section compares the candidate-level measures of campaign messages to individual voters' evaluations of the candidates, as captured in the 1988 Senate Election Study. It is important to determine how the candidates' overall messages influence evaluations. Accordingly, I first construct measures of the extent to which these overall messages are supported by background activities. I then compare these measures to voters' evaluations of the 1988 Senate candidates.

For each candidate, I calculated the mean of each background measure (extent of background and common interest) for the issues on which the candidate had offered a positive message. The result was the overall extent of background and common interest for the candidate's positive messages. I calculated similar measures for issues on which the candidate offered negative messages. For the latter measures, I used the background measures of the candidate's opponent on the issues where the candidate attacked the opponent. Significantly, the common interest measures are no longer calculated using the ideology of the state elec-

TABLE 5. Average Background Characteristics in Different Types of Messages

Type of Message	Extent of Back-ground	Common Interest	Number of Cases
Messages about incumbent			
Incumbent positive messages	.93	.13	1,174
Challenger negative messages	1.05	.19	1,174
Messages about challenger			
Challenger positive messages	.45	.20	863
Incumbent negative messages	.23	.03	863

Note: This table contains the means of the extent of background and common interest measures for different types of messages. To obtain the first entry (.93), I calculated each incumbent's overall extent of background on the issues in her positive messages. Each of the 1,174 respondents was then assigned the value for the overall extent of background for their incumbent's positive messages. The average of these values across the respondents is .93. As in Table 1, these values range from 0 to 2. But while Table 1 included the incumbent's values across all 27 issues, here I only used the values for issues on which the incumbent offers a positive message. The remaining entries in the table were calculated in a similar manner.

torate. Instead, the individual-level nature of survey data allows calculation of common interest between a candidate's messages and an individual respondent.¹²

The overall background measures for the candidates' messages are summarized in Table 5. In the first column, the measure of extent of background again ranges from 0 to 2. At the latter value, a candidate has developed an extensive record on the issues raised in the particular messages. The measure equals 0 if the candidate possesses no record on the issues in the particular messages, or offers no messages of the relevant type (positive or negative). The differences shown in the first column are instructive. The extent of background appears much higher in messages about

incumbents (.93, 1.05) than in messages about challengers (.43, .23). This difference undoubtedly reflects the lengthier records of incumbents compared to those of many challengers.¹³ That is, incumbents often have more background information to support their positive messages. But the lengthier records also give challengers more ammunition for attacking incumbents.

The second column of Table 5 summarizes the common interest in the messages. This measure again ranges from -2 to 2. Higher values indicate that for the issues in the particular messages, the candidate possesses a record which indicates a position close to that of an individual respondent. With lower values, the candidate's record on issues in the messages suggests a position far from that of an individual respondent. Among messages about challengers, the positive messages from the challengers themselves indicated greater common interest (.20) than do the incumbents' negative messages attacking those challengers (.03). The challengers want to encourage voters to perceive them as sharing common interests, whereas the incumbents want to portray their opponents as lacking common interest with voters. The two groups of candidates therefore emphasized different issues in their messages in an attempt to create contrasting pictures of the challengers' common interests. A different pattern occurs with messages about incumbents. Here, the challengers' attacks indicate only slightly greater common interest (.19) than do the incumbents' messages about themselves (.13). This unexpected result may stem from incumbents personally sharing the interests of their constituents and carefully building records to reflect that common interest. As a result, challengers may find it difficult to uncover evidence in the incumbents' records indicating otherwise.

These overall background measures theoretically indicate the overall effectiveness of candidates' messages. Recall that in a principal-agent relationship, properties of a potential agent can signal whether hiring that agent will further the employer's interests. In the context of a campaign, two important properties of a candidate are the extent of her record and whether that record suggests a common interest with voters. Campaign messages that highlight these properties are likely to win a voter's support more effectively. The results in Table 4 suggest that candidates often choose this type of message, considering it an effective way to win votes. In the analysis that follows, I test the accuracy of this belief by examining how the background measures from Table 5 influence voters' evaluations of candidates.

Individual Voters' Evaluations of Candidates

The Senate Election Study asks respondents to place both themselves and Senate candidates on a seven-point ideological scale. I used these placements to create one dependent variable for incumbents and another for challengers. For each candidate, the variable is the absolute value of the distance between a

¹² The Senate Election Study asks respondents to place themselves on a seven-point ideological scale. I used these placements to create a measure of common interest between respondent and candidate, for the candidate's positive messages. I first rescaled the self-placement to range from -2 to 2, with higher values denoting more liberal respondents. This range is identical to that of the possible positions of each candidate on each issue. I then calculated for each issue the absolute value of the difference between the candidate's position and the rescaled respondent self-placement. The resulting value ranges from 0 to 4, with low (high) values denoting high (low) common interest. To make this gauge of common interest more intuitively understandable and more comparable to the analysis in the previous section, I subtracted it from 2. This new value ranges from -2 to 2, with low (high) values indicating low (high) common interest. Finally, I averaged these new values for all issues on which the candidate offered a positive message. This average captures the overall level of common interest in the candidate's positive messages. I calculated a similar common interest measure for each candidate's negative messages. Significantly, these respondent-specific measures of common interest omit valence issues, which by definition have a single extreme point as the most favorable position. On nonvalence issues, each respondent's most favorable position is any point along a continuous ideological scale. So, in the individual-level calculations, the valence and nonvalence issues are based on different types of scales that are hard to combine into one measure.

¹³ The analysis below omits races for open seats.

respondent's self-placement and her placement of the particular candidate. The more favorably respondents evaluate a candidate, the more likely they are to place that candidate close to themselves. That is, a smaller value of the dependent variable indicates a more favorable evaluation.¹⁴

To capture the effectiveness of a candidate's positive messages, the model includes the measures (from Table 5) of the overall extent of background and common interest on the issues in those messages. An interaction term captures the potential interaction between the two measures. I also include three similar variables for the issues used in negative messages attacking the candidate. I expect the message variables to influence voters' evaluations in the following ways. The greater the extent of background and common interest underlying a candidate's positive messages, the more favorable will be the evaluations from voters. In other words, evaluations will be higher if a candidate's background supports her claims of sharing voters' interests on an issue. For negative messages, the greater the extent of the opponent's background, the more effective those messages will be. Candidates attack on issues where their opponents lack common interest with voters. If the common interest suggested by the negative message is lower, voters are less likely to evaluate the opponents favorably. Simply put, attacks on opponents are more effective if they highlight a lack of common interest in the opponents' records.

I control for a number of factors that may mediate the relationship among messages, backgrounds, and evaluations. An important individual-level consideration is the congruency between the respondent's and the candidate's party. Partisanship can serve as a useful cognitive shortcut for voters struggling to evaluate a candidate (Popkin 1991). A voter may be more inclined to place her own party's candidates closer to herself, while placing candidates from the opposite party farther away. The partisan congruence measure equals 1 if the respondent shares the candidate's partisanship, 0 if the respondent is an independent, and -1 if the respondent is of the opposite party. Another control involving individual respondents is the number of days

between election day and the survey interview for each respondent. As this period increases, respondents may encounter increasing amounts of information about the election winner (often the incumbent). The loser (often the challenger) may receive decreasing amounts of publicity during this period. The proincumbent bias in information may lead to a similar bias in respondents' evaluations of candidates (Wright 1993).

My analysis also controls for two campaign-level factors. The first is the balance of information flowing to voters. In elections with a strongly favored incumbent, voters may receive little negative information about her, and little information at all about the challenger. Voters in this type of campaign may place the incumbent closer to themselves and the challenger farther away. In competitive campaigns, in contrast, voters may receive more positive information about the challenger and more negative information about both candidates (Westlye 1991). The more balanced information flow may lead voters to place incumbents farther from themselves and challengers closer. I operationalize this control with a folded version of the October rating of each campaign's competitiveness, produced by *Congressional Quarterly Weekly Report*. The new version ranges from 1 (safe) to 4 (toss-up).

A second campaign-level factor, challenger quality, may affect voters' evaluations in similar ways. More qualified challengers often run more competitive campaigns, providing more positive information about themselves and more negative information about the incumbent. As a result, voters in these campaigns may place incumbents farther from themselves and challengers closer. The challenger quality variable ranges from 1 (experience-seeking challenger) to 4 (experienced challenger) (Canon 1993). It is important to note that the measure of quality may capture some of the same challenger characteristics used to produce the background variables. Including the challenger quality variable in the models makes it more difficult to produce evidence that the background or challenger quality variables exert a significant effect on voters' evaluations.¹⁵

Table 6 contains the OLS estimates for the two evaluation models. Of the control variables, only the partisan congruence measure produces significant coefficients. As one moves from a respondent not from the incumbent's party (-1) to a respondent who shares the incumbent's party (1), the estimated distance between respondent and incumbent falls by .60 ($2 \times -.30$). The equivalent figure for challenger placements is .74. As expected, a candidate receives better evaluations from voters in her own party than from those in

¹⁴ Two alternative measures of evaluations are vote choice and open-ended likes and dislikes. When I replaced the distance measure with these alternatives, the message variables exerted similar but weaker effects on the dependent variables. The weaker results are not surprising. First, vote choice can be influenced by all four sets of message variables (positive and negative messages of incumbents and challengers). Too complex and overlapping for a single vote equation, these effects can be separated by focusing on the individual components of each respondent's vote choice: her evaluation of each candidate. Thus, I present separate models for incumbent and challenger evaluations. Second, the distance measure holds an important advantage over the net sum of likes and dislikes. A respondent may carry an overall evaluation of a candidate, without remembering specific likes and dislikes. The respondent updates this summary evaluation whenever she encounters new details about the candidate. After updating the evaluation, the respondent may drop the details from memory, retaining only the overall evaluation. Under this scenario, the campaign still influences the voter's evaluation, but she does not remember details about the candidate. The likes-dislikes measure labels this voter as having no evaluation, whereas the distance measure captures the change in evaluation resulting from the campaign.

¹⁵ This model resembles that of Franklin (1991). His model predicts respondents' actual ideological placements of politicians, while this model predicts the perceived distance between the respondents' placement of themselves and the politicians. I reestimated Franklin's model incorporating the background variables used here. Only the extent of background variables produced a significant and consistent effect, which was limited to respondents' certainty in making the placements. As the extent of background underlying candidates' messages increases, the variance in respondents' placements diminishes. That is, respondents are more certain in placing a candidate whose messages emphasize issues on which she has built a record.

TABLE 6. Model of Respondent's Perceived Distance from Candidates

Independent Variable	Incumbent	Challenger
Constant	1.49*** (.15)	1.71*** (.16)
Partisan congruence	-.30*** (.04)	-.37*** (.05)
Days between election day and respondent's interview	.001 (.003)	.004 (.003)
Competitiveness of race	-.10 (.06)	-.08 (.09)
Quality of challenger	.04 (.03)	-.02 (.04)
Positive messages of candidate		
Extent of background	.04 (.06)	-.06 (.12)
Common interest	-.13 (.12)	-.26* (.12)
Extent $\times$ common interest	-.03 (.08)	-.07 (.15)
Negative messages of candidate's opponent		
Extent of background	-.01 (.06)	.17 (.10)
Common interest	.48** (.15)	-.21 (.35)
Extent $\times$ common interest	-.34*** (.09)	-.04 (.24)
Number of cases	1174	863
Adjusted R^2	.07	.12
SEE	1.29	1.33
F-tests for joint effect of variables		
Overall model	9.43***	12.81***
Three variables for positive messages	3.01*	7.39***
Three variables for negative messages	5.18**	2.90*

* $p < .05$; ** $p < .01$; *** $p < .001$. Standard errors are in parentheses.

the opposite party. This pattern is weaker for incumbent evaluations. Legislators may use constituent services and other office resources to win the support of partisans of the other party but challengers lack these means.

Of the variables related to candidate messages, only three of the twelve coefficients are significant. The joint effects of the variables, however, are more strongly significant. As the last two rows of Table 6 indicate, the F -statistic for each trio of message variables is jointly significant at least at the .05 level (Kennedy 1996).¹⁶

¹⁶ The inclusion of interaction terms appears to reduce the significance of the individual message variables that capture positive messages about the incumbent and both types of messages about the challenger. When I reestimated the models without interaction terms, the six variables capturing those three types of messages produced three significant coefficients. But the two variables related to negative messages about the incumbent produced no significant coefficients. The interaction term appears crucial for capturing the influence of these two variables on evaluations of incumbents (as evidenced by their strongly significant coefficients in Table 6). Therefore, I report the model including the interaction terms, despite their negative effect on the individual significance of the other message variables.

The interaction terms make it difficult to interpret the individual coefficients substantively. I therefore used these coefficients to estimate the distances between respondents and candidates for different types of backgrounds and messages. Table 7 presents these predicted values. In the incumbent's positive messages about herself, emphasizing issues with no background or position produces an estimated distance of 1.58. But if the incumbent focuses on issues on which she has developed a record but no clear position, the perceived distance rises slightly, to 1.66. Such an increase runs counter to theoretical expectations. Incumbents may have developed extensive records on many issues in their positive messages, which depresses the variation and subsequent effect of the extent of background variable. The influence of common interest conforms more closely to expectations. If an incumbent's background underlying her positive messages suggests a common interest with a respondent, then the perceived distance drops to 1.30. In other words, evaluations of the incumbent improve if her positive messages highlight evidence of common interest with voters.

Slightly different patterns occur for a challenger's attacks on an incumbent. Comparing messages that lack with those that possess background information about the incumbent, we see that the estimated distance from the incumbent is largely unchanged (1.58 versus 1.56). This lack of change in extent of background does not support theoretical expectations. Comparing the presence or absence of common interest produces more predictable evaluations. If a background-supported attack on the incumbent suggests a lack of common interest with a respondent, the voter's perceived distance increases to 1.98. That is, this type of negative message leads to less favorable evaluations.

Challengers' backgrounds appear to influence the effectiveness of messages even more dramatically than do the incumbents' records. If a challenger's positive messages focus on issues on which she lacks background and position, the estimated distance is 1.75. Consistent with expectations, the distance drops to 1.63 if she emphasizes issues on which she has built a record but no clear position. If she emphasizes issues on which her record indicates common interest with a voter, the perceived distance drops even more, to 0.85. Thus, careful selection of issues for campaign messages can win more favorable reactions from voters.

Incumbents' attacks on challengers also appear to vary in effectiveness. If an incumbent criticizes a challenger on issues where the challenger lacks background and position, the perceived distance between respondent and challenger is estimated to be 1.64. But if the incumbent attacks on issues where the challenger has built a record with no clear position, the estimated distance rises to 1.97. The distance increases to 2.56 if the challenger's record on the issues under attack indicates a lack of common interest. The correct type of negative messages can hurt significantly a challenger's evaluations.

There is a flipside to the selection of issues and messages. Emphasizing the wrong issues can hurt a candidate's own evaluations or improve those of the

TABLE 7. Estimates of Voters' Perceived Distance from Candidates, by Background Characteristics in Different Types of Messages

Incumbent's Background Characteristics in Types of Message about Incumbent		Voter's Perceived Distance from Incumbent	
Extent of Background	Common Interest	Positive Messages about Incumbent	Negative Messages about Incumbent
Lacks background	No clear position	1.58	1.58
Possesses background	No clear position	1.66	1.56
Possesses background	Common interest	1.30	1.15
Possesses background	Lack of common interest	2.02	1.98

Challenger's Background Characteristics in Types of Message about Challenger		Voter's Perceived Distance from Challenger	
Extent of Background	Common Interest	Positive Messages about Challenger	Negative Messages about Challenger
Lacks background	No clear position	1.75	1.64
Possesses background	No clear position	1.63	1.97
Possesses background	Common interest	0.85	1.37
Possesses background	Lack of common interest	2.42	2.56

Note: The distances were calculated using the coefficients in Table 6. For the distances related to positive messages about incumbent, I held at their means all variables except the background measures linked to these positive messages. For the estimated distance when those messages emphasized issues with no background or position, I assigned a 0 to both the extent of background and common interest variables for the incumbent's positive messages. I then calculated the perceived distance when the incumbent's positive messages are supported by background but no clear position. Here, I assigned a 2 to the relevant extent of background variable and a 0 to the common interest variable. Next, I calculated the perceived distance when the incumbent's positive messages are supported by background indicating common interest with the voter. I assigned a 2 to both the extent of background and the common interest variables. Finally, I calculated the perceived distance when the incumbent's positive messages are supported by background indicating a lack of common interest with the voter. I assigned a 2 to the extent of background variable and a -2 to the common interest variable. The other distances in this table were calculated in a similar manner.

candidate's opponent. For example, if an incumbent emphasizes issues on which her record suggests a lack of common interest with a respondent, the model estimates the distance at 2.02. This evaluation is worse than the case of no record at all (1.58). Similarly, if a challenger attacks on issues about which the incumbent's record indicates common interest with a respondent, the estimated distance is 1.15. This value is smaller than in the case of attacks on issues where the incumbent lacks a record (1.58). Drawing attention to an opponent's favorable record hurts a candidate's chances more than issuing attacks unsupported by background information.

Overall, these results contain a number of noteworthy findings. When candidates emphasize issues on which their records indicate a common interest with respondents, those voters are likely to perceive the candidates more favorably. Negative messages are more effective if they highlight issues on which the opponent's record suggests a lack of common interest with voters. These patterns provide strong evidence of the influence of candidate background on the effectiveness of campaign messages.

An additional finding merits attention. Despite the alleged superiority of attack ads in influencing voters' evaluations (Jacobson 1997), my analysis of positive and negative messages does not produce a clear pattern of contrasting effects. Neither type of message is more effective for both candidates. Instead, the main variation occurs between messages about incumbents and challengers: Differences in the records underlying messages affect evaluations of challengers more strongly than incumbents. The varying effects may stem from information that voters possess at the start of the

campaign. During years of Senate service preceding the campaign, incumbents pass extensive information about themselves to voters. Those precampaign reputations may be more impervious to campaign claims, positive or negative, than challengers' reputations. Voters are less likely to know much about challengers at the campaign's outset, so their reputations may be more susceptible to campaign influences. These contrasting patterns only partially support the argument that challengers' campaign efforts are more effective, dollar for dollar, than those of incumbents (Jacobson 1997). Positive messages boost the evaluations of challengers more than they boost the evaluation of incumbents. But the negative messages of incumbents appear more effective than those of challengers, possibly because challengers' reputations are more malleable.

CONCLUSION

These results directly address the three questions raised at the beginning. Election campaigns do appear to follow generalizable rules: Candidates often campaign on issues for which they have built favorable records. Background-supported messages appear to influence individual voters. Candidates win more favorable evaluations if they focus on their records and avoid making unsubstantiated claims. These findings provide compelling evidence against the view that campaigns distort candidates' positions and deceive voters.

The greater effectiveness of background-supported messages thus appears to limit the extent to which candidates stray from their records when campaigning. This limit varies from one candidate to another, how-

ever. For those who have developed a record on only one or two issues, the most effective strategy is to focus on those few issues. More experienced candidates often have built records covering a wide range of issues. They can selectively choose the issues on which their records support the most attractive claims. Manipulation is also possible on an individual issue for which a candidate has developed a record. Some elements in that record may support a liberal position, while others may support a conservative one. The candidate may emphasize the electorally attractive position and supporting evidence, while her opponent may focus on the unfavorable position and evidence. Voters then find it difficult to decide which claim accurately characterizes the candidate. But if the large majority of information in the record supports a particular position, then it is more difficult for the candidate or her opponent to make an effective claim that the candidate does not hold that position.

Despite these continued opportunities for manipulation, candidate records still help campaigns play a crucial role in representation. Background information does not ensure that candidates will campaign on every aspect of their records. But the greater effectiveness of background-related messages appears to discourage candidates from making unsubstantiated claims when communicating with voters. The constraint of past activities pushes candidates to campaign on their records, and voters appear to incorporate these claims into their evaluations of candidates. Such behavior is crucial for representation to occur.

The Dynamics of Foreign Policy Agenda Setting

B. DAN WOOD and JEFFREY S. PEAKE *Texas A&M University*

Theoretical and empirical work on public policy agenda setting has ignored foreign policy. We develop a theory of foreign policy agenda setting and test the implications using time-series vector autoregression and Box-Tiao (1975) impact assessment methods. We theorize an economy of attention to foreign policy issues driven by issue inertia, events external to U.S. domestic institutions, as well as systemic attention to particular issues. We also theorize that the economy of attention is affected by a law of scarcity and the rise and fall of events in competing issue areas. Using measures of presidential and media attention to the Soviet Union, Arab-Israeli conflict, and Bosnian conflict, we show that presidential and media attentions respond to issue inertia and exogenous events in both primary and competing issue areas. Media attention also affects presidential attention, but the president does not affect issue attention by the media.

Various theoretical and empirical analyses have focused on understanding how domestic policy issues reach the systemic or institutional agenda in the United States (e.g., Cobb and Elder 1972; Downs 1972; Jones 1977; Walker 1977; Anderson 1978; Kingdon 1984; Peters and Hogwood 1985; Light 1991; Baumgartner and Jones 1993; Jones 1994; Flemming, Wood, and Bohte 1995). There have also been case studies that explore how single issues develop, also all domestic (e.g., Bosso 1987, Carmines and Stimson 1989, Glick 1992). As of yet, however, there has been no systematic analysis exploring the dynamics of U.S. foreign policy agenda setting.

This neglect of foreign policy by students of American politics is not a matter of chance but is due to practical reasons. Foreign policy does not readily fit the theoretical mold most scholars associate with domestic issues. Theories and analyses of domestic policy agenda setting usually focus on concepts like problem perception, issue definition, mobilization of interests, subsystem formation, venue shopping, and institutional attention.¹ The first two and last of these concepts are certainly relevant to foreign policy agenda setting. It is less certain that interest groups, subsystems, and venue shopping are of much importance. The conventional wisdom is that for many foreign policy issues subsystems do not develop, since these issues do not typically involve the material or solidary benefits required to invoke strong interest group participation (e.g., Ripley and Franklin 1991).² Congress and its

committees are generally considered to have less influence in foreign policy than in domestic policy. Moreover, the president is the primary venue through which new foreign policy issues enter the U.S. system.³

There can be little doubt that the presidency has evolved through time as the primary actor responsible for U.S. foreign policy. The Constitution limited presidential authority in this area with respect to war, making treaties, and appointing official representatives to foreign nations. Short of war, however, the president has traditionally received considerable latitude. The president is the only actor in the U.S. system who can legitimately speak for the nation as a whole or be spoken to by other nations (usually through ambassadors). The increasing involvement of the United States in the international community, the public's desire for strong personal leadership, and the political ramifications of foreign policy mean that the presidency attends more heavily to foreign policy issues than does any other U.S. institution.

Theories and analyses of domestic policy agenda setting also tend to describe the process as proceeding in a slow secular fashion, occasionally spurred by focusing events or the policy entrepreneurship of important actors or groups (Anderson 1978, Cobb and Elder 1972, Kingdon 1984). Yet, foreign policy issues do not often arise in such a gradual fashion. Rather, they tend to burst onto the scene as a result of crises or

issues. The degree of involvement obviously depends on the type of issue. Trade policy, for example, would provide the cement for subsystem relations to develop. Congress may also become involved in human rights or strategic arms control. Ripley and Franklin (1991; see also Ripley and Lindsay 1993, chapter 2; Lindsay 1994, chapter 7) provide a framework for considering different types of foreign and defense issues.

³ The view stated here has long been the dominant one among presidential scholars. For example, historian Arthur Schlesinger states: "In foreign policy the inclination is to let the Presidency have the responsibility—and the power" (1989, 420; see also Halperin, quoted in Doherty 1993, 323). Likewise, Barbara Sinclair (1993; see also Hinckley 1994) argues that while congressional leaders have been more active in foreign and defense policy since the Vietnam War, their influence is limited to the extent they are acting as independent policy entrepreneurs, rather than as agents of an active and involved membership. In contrast, see Lindsay (1994) for an extended discussion asserting congressional influence on U.S. foreign policy making.

B. Dan Wood is Professor of Political Science, Texas A&M University, College Station, TX 77843-4348, and on the faculty of the George Bush School of Government and Public Service. Jeffrey S. Peake is a Ph.D. candidate, Department of Political Science, Texas A&M University.

The authors appreciate comments on earlier versions of this manuscript by George C. Edwards III, Kenneth J. Meier, Steven A. Shull, Nehemia Geva, and four anonymous reviewers. This research was supported financially by the Center for Presidential Studies, Texas A&M University.

¹ Venue shopping means that because of the U.S. system of fragmented representation, potential agenda setters have multiple institutions through which to pursue policy goals.

² We do not mean to imply that interest groups and congressional committees never become involved in foreign policy or have no influence, but their involvement is typically less than for domestic

other dramatic occurrences, and once they are on the scene attention is driven by a continuous stream of policy events. While events are occasionally important in driving attention to U.S. domestic issues (e.g., a Martin Luther King speech and civil rights, a thalidomide controversy and drug safety, an attempted presidential assassination and gun control), they are of much greater importance in driving attention to issues in foreign policy.

THE ECONOMY OF FOREIGN POLICY ATTENTION

We explore the determinants of attention to major foreign policy issues in the U.S. system. As noted above, past work on domestic policy agenda setting provides a weak theoretical basis for exploring the dynamics of foreign policy attention. Pluralism and interest groups are generally considered of lesser importance, the process is seen as event driven, and foreign policy making is considered the primary domain of the president. A theory of foreign policy agenda setting and attention, therefore, should necessarily focus on the president. Yet, the president's ability to attend to particular foreign policy issues is often constrained by other responsibilities. The president is governed by an economy of attention in which competition exists for scarce resources.

Of course, the proliferation of demands on the modern presidency has produced new institutions within the White House that are intended to alleviate limitations due to scarce presidential resources. Yet, modern presidents and their staffs remain only boundedly rational (Simon 1947). Cognitive limitations mean that they neither can accurately forecast the rise of new foreign policy issues nor possibly attend to the plethora of potential issues that ultimately arise. As a result, presidents purposely restrict the set of issues at any one time to a few. They tend to process these few issues in a serial rather than parallel fashion, attending to one before moving on to the next (Jones 1994). In order to prioritize issues, presidents rely on cues from their environment regarding the relative severity of the problem, as well as political benefits and costs. As political creatures, presidents are ever aware of the risks associated with ignoring or attending to new policy problems.

To be sure, this economy of attention is altered when presidents make conscious efforts to give higher priority to some issues rather than others. The president brings to office an agenda and, if possible, will attempt to implement it (Light 1991). For example, President Nixon clearly gave a high priority to relations with China, which necessarily restricted the amount of time he could spend on other issues. This personal dimension the president brings to the office is inherent to the motivations and goals of the individual. Yet, even though most presidents have foreign policy goals, they often have agendas thrust on them by the office and external events.

Indeed, multiple forces move attention to foreign policy issues away from presidential discretion. For one

thing, presidents often inherit problems that dominate their attention through time. Chief executives from Truman through Bush inherited the foreign policy problems associated with the Cold War and devoted considerable time to these issues. Similarly, President Nixon inherited Vietnam from the Johnson administration and necessarily devoted more attention to this issue than to any other foreign policy domain. On issues of this sort, presidents must fulfill continuing obligations to the office and nation, regardless of personal agendas.

More generally, once issues gain prominence in the economy of presidential attention, attention becomes highly inertial. As a technical matter, the most important foreign policy issues are very persistent and require time and effort to resolve. To be successful, presidents must maintain focus on the difficult issues until they wane or at least are displaced in importance by other concerns. The security of the free world, public approval, and the president's historical legacy all depend on dealing effectively with important problems, so there is strong incentive for the president to maintain focus to the potential exclusion of other issues.

This highly inertial character of some foreign policy issues suggests a rationale for the economy of attention to exhibit stability. Presidents tend to concentrate on the most difficult foreign policy problems. The proportion of presidential time devoted to these problems remains fairly stable so long as they require strong consideration and no more pressing problem arises. The duration of attention to foreign policy problems is proportional to the tractability of the problem. As long as the problem remains unresolved, presidential attention remains fairly consistent.

Nevertheless, short-term disturbances to this stability may occur due to policy events or changes in perception of the relative importance of the issue. Because the president must ration attention according to which issues are most critical, shifts also may occur as new problems arise. These shifts may be either short or long term. In either case, the chief executive often operates in a responsive mode, reacting to a continuous stream of exogenous events. There can be little doubt, for example, that President Truman preferred not to be dealing with the Soviet blockade of West Berlin in 1948, but this event skewed foreign policy attention even more toward U.S.-Soviet relations through early 1949. Likewise, President Carter preferred not to be attending to the Iran hostage crisis during the 1980 election year, but he had little choice, since it also dominated media and public attention that were critical to the election. Not all foreign policy events are this dramatic, but still there is a continuous progression of world events to which presidents must always attend.

The decision as to what constitutes an issue deserving of executive attention may initially arise through developing events, but political factors affect the perceived importance and persistence of foreign policy issues. The president cares about public perceptions. The president has always depended on public ap-

proval as a source of legitimacy and strength in dealing with other actors, both foreign and domestic (Neustadt 1960). While approval of the way a president is doing the foreign policy job does not fully determine approval, it does at times comprise an important component, especially when foreign policy is salient (Edwards, Mitchell, and Welch 1995). To maintain good standing, the president must attend in some measure to what the public perceives as important. Thus, as the public pays greater attention to an issue, the president must in turn attend more to that issue.

Of course, public perceptions of the relative importance of an issue are largely determined by the news media. The media interpret issues, giving them more or less significance through the type or amount of coverage provided. The media, particularly television news, also focus attention on events through this same interpretive function. Americans generally do not pay attention to foreign policy issues until events covered by the news media cause them to do so, and then their attention is slight and deteriorates quickly (Wittkopf 1990). Iyengar and Kinder (1987) show that what the television news covers influences what citizens think is important and how they evaluate their leaders. Likewise, Bosso (1989) argues that the media played an important role in mobilizing the citizenry toward famine relief in Ethiopia during the 1980s. Television news chose to focus on the famine, making an endemic problem in Africa a new foreign policy problem in the United States. Thus, media attention to foreign policy issues and events may drive systemic attention, as well as attention by the president.

The direction of this relationship may not run purely from the media or system to the president, however. Presidents are not purely responsive actors bending with the breezes of popular attention. Rather, they also seek to lead on matters of policy. The president often wants to achieve a personal agenda, both domestic and foreign, but especially in the area of foreign policy the president is expected to be the locus of policy influence. Manipulation of the press is critical to the White House operation (Cohen 1963), and all presidents since Franklin Roosevelt have maintained a staff dedicated to informing the media on matters of interest to the president. In efforts to lead, the president attempts to mold how the media treats emerging issues and events. For example, Brace and Hinckley (1992) found that presidential trips, summits, speeches, and other initiatives create rallies in public approval while attracting large amounts of media attention. More generally, each year the president is given the stage to set the policy agenda for the American people and Congress through the State of the Union address. Cohen (1995) showed that public opinion follows the president's lead on which problems are most pressing, as outlined in the State of the Union address. Thus, the media are a principal means whereby presidents attempt to shape the foreign policy agenda and lead systemic attention toward those issues the president deems as important.

EVALUATING THE ECONOMY OF ATTENTION TO FOREIGN POLICY

To what extent is presidential attention to foreign policy issues a result of issue inertia or a continual progression of stochastic events? To what extent is systemic attention to foreign policy issues a result of issue inertia or stochastic events? Does the president respond to changing systemic attention to foreign policy issues? Does the system respond to changing presidential attention to foreign policy issues? These are important questions for understanding the president's role as foreign policy leader, as well as for extending political science theories of agenda setting to the foreign policy domain.

We address these questions by developing measures of systemic and presidential attention for three foreign policy issues and related events. In particular, we look at issues involving the Soviet Union, the Arab-Israeli conflict, and the more recent Bosnian conflict. We chose these three because they have been the most highly visible and enduring foreign policy issues for the president over the last 15 years. Foreign policy issues of lower visibility and endurance (such as the South China sea, chemical and biological weapons) are also part of the president's agenda and may be of considerable importance. As a result, we suggest that future research examine a diverse range of issues with differing visibility and interest to the president.

We used weekly time-series data to capture the fine time dynamic associated with responsiveness by both the media and president to world events and also to enable greater confidence in the findings due to the larger sample size. We measured systemic attention for issues involving the Soviet Union and Arab-Israeli conflict as the weekly broadcast time devoted by television news from the 27th week of 1984 through the 23d week of 1994. The Bosnian conflict, which has been less protracted and is confined to the 1990s, is measured as the weekly broadcast time from the 25th week of 1991 through the 11th week of 1995.⁴ Rather than counting the number of stories, as has been done in some past research (e.g., Baumgartner and Jones 1993; Flemming, Wood, and Bohte 1995), we counted the number of minutes devoted to each issue on the three nightly television news programs. Specifically, we searched the *Vanderbilt Television News Abstracts* using keywords (listed in the Appendix) to capture stories concerning the Soviet Union and Arab-Israeli and Bosnian conflicts.⁵ We examined each hit of the key-

⁴ For post-Soviet Union observations after late 1991, we examined relations between the United States and the states of the former Soviet Union. The time frame studied was driven entirely by data availability. The beginning and ending dates were constrained by the PANDA events data (to be discussed below), which are continuously being updated and extended toward the present by the project directors. At the time we constructed the Soviet and Arab-Israeli measures, the PANDA data were available only through mid-1994; at the time we constructed the Bosnia measure, the PANDA data were available only up to early 1995.

⁵ The *Vanderbilt Abstracts* are available on the web at the following address: <http://www.TVnews.Vanderbilt.edu>. The information logged here comes in the same format as the hard copy versions

words for validity concerning whether it dealt with some facet of the foreign policy issue or whether some isolated event affected the measure. Although the nightly news programs are not the only television news sources that may influence or be influenced by the president, they do provide a consistent sample of coverage and are also continuous for the period under study. Each network spends about 22 minutes each day delivering the news in half-hour programs (Tyndall 1995). This leads to a typical weekly news coverage of roughly 150 minutes, or 450 minutes total for the three networks.

Measuring presidential attention to these three issues is more difficult. The president's public face may not be a true reflection of what is actually being attended to behind the scenes. Unable to know beyond question what the president is doing, we must assume that what he does and says publicly from week to week reflects what is on his agenda.⁶ Cohen (1995) made this assumption and measured presidential attention to domestic policy issues by looking at State of the Union addresses. These speeches are only made annually, however, and may give an incomplete image of attention as it changes due to events and shifting circumstances during the year. It is also unclear that the relative issue emphases in the State of the Union address provide an accurate picture of presidential priorities on foreign policy. Presidents make their priorities known through a number of outlets, including the State of the Union address, legislative proposals, news releases, position taking, briefings, speeches, press conferences, and letters.

To capture presidential attention registered through all these diverse outlets, we used *Public Papers of the President*, an annual compilation of activities during each year. As with the TV news search, we used keywords (listed in the Appendix) in the subject index in each volume and searched the text for relevant activities. Specifically, we counted the number of paragraphs during each week of each year of the *Public Papers* devoted to some facet of Soviet relations, the Arab-Israeli conflict, and the Bosnian conflict. We also read each entry to assure that it was pertinent to the keyword entry and the concept under investigation.

We measured international events using the PANDA events data set provided by the Program on Nonviolent Sanctions and Cultural Survival from Har-

vard University (Bond and Bond 1995). PANDA uses an artificial intelligence program (KEDS) to code discrete events from Reuters news leads.⁷ "An event is an interaction, associated with a specific point in time, that can be described in a natural language sentence that has as its subject and object an element of a set of actors and as its verb an element of a set of actions, the contents of which are transitive verbs" (Bond and Bond 1995, 5). In other words, PANDA events are reports of discrete actions by a source country toward a target country or discrete actions completely within a single country, such as a civil war or rights violation. Using keywords (listed in the Appendix) relating to the three issues, relevant events were separated from the entire data set. Of course, we could have coded a dummy variable for the presence or absence of international events based on the PANDA data set. Using a weekly count of events, however, enabled the measure to reflect the relative seriousness of developing situations, as well as their presence. The events were then counted by week to create a consistent measure of exogenous events to match the other two series. Both the TV news networks and the president use Reuters to monitor world events, so it is almost *prima facie* evident that there should be some effect from this measure on media and presidential attention to these issues. The question is whether, independent of world events, effects exist from the national media to the president or from the president to the media.⁸

With measures in hand for systemic and presidential attention to foreign policy issues, as well as exogenous events, we used vector autoregression (VAR) methods (Freeman, Williams, and Lin 1989; Simms 1980) to evaluate the causal direction of attention and also to provide evidence of the temporal dynamics associated with the policymaking system. VAR is the most appropriate method for circumstances in which theory provides a weak rationale for imposing restrictions on the parameters of a structural equation system. As our theoretical discussion above indicates, we have no *a priori* reason for imposing parameter restrictions in either direction; yet, without them a structural equation system is not identified. Thus, structural equations are inappropriate. This does not mean, however, that the approach we use is devoid of theory. Indeed, all aspects of the reported VAR model have some theoretical rationale. We merely ask the data to tell us

available in most university libraries and has the advantage of allowing electronic searches. We used *NETSCAPE* as a search engine, which virtually eliminated the problem of double counts that may plague the use of electronic searching in other contexts. The cache file in *NETSCAPE* changes the colors (by default from blue to pink) of all links previously accessed, until it is reset. Each story was rounded to the nearest half minute.

⁶ We can argue the relative merits and demerits of this assumption from either perspective. On the one hand, the president wants to appear "on top of things" in order to garner public approval. As a result, his public activities and statements should actually reflect what is being attended to behind the scenes. On the other hand, there may be occasions when secrecy is important, in which case public activities and statements may be a facade that masks what the administration is actually doing.

⁷ KEDS stands for the Kansas Events Data System. This program was developed by Philip Schrodtt of the University of Kansas at Lawrence. Schrodtt and Gerner (1994) describe the program in detail and also report validity tests of the machine-coded events.

⁸ In a strict sense, not all PANDA defined events are strictly exogenous to the presidency. The president may take initiatives that form "historical threads" which become part of event progressions. In addition, some PANDA events may not be causally prior to presidential or media attention. The president and media may anticipate such events as elections, scheduled meetings, and the like. In theory it would be possible to separate out such potentially confounding influences if one had access to the text used to create the PANDA data. Given that we do not have such access, we simply acknowledge these potential confounding effects.

(given that theory does not) which, if any, parameter restrictions are appropriate.

Another important advantage of VAR modeling over the structural equation approach is that it provides a strong control for history by including multiple lags of each variable in all equations. This means that problems of specification error are of less concern, since the VAR disturbances are random with respect to time.⁹ One way of viewing VAR modeling is as a multivariate extension of the Granger (1969) approach to causal inference. Each dependent variable is regressed on lagged values of itself, as well as lagged values of the other dependent variables in the system.¹⁰ Causal relations are evaluated by conducting joint hypothesis tests for blocks of lags associated with each variable. What is interesting for us theoretically is that the control for history provides a representation of the degree to which issue inertia affects attention by both the media and president. A significant block of coefficients on the dependent variable in each equation implies that issue inertia is strong.

VAR methods typically exhibit high colinearity due to the multiple lags included for each variable in the system. For this reason analysts do not typically try to interpret coefficient estimates but instead do simulations to track out the system dynamics. We report Granger tests and simulations using the moving average response approach. That involves introducing a shock to a variable in the system and tracking out movements in the other variables using the VAR estimates for computing a forecast. Shocking a variable means successively multiplying the matrix of vector autoregressive estimates by a simulation vector containing changes in the variable of interest.¹¹

Based on theory, we also entered international events into the VAR system as a single exogenous variable with no lags. Such an approach is sometimes

termed ARX modeling (Judge et al. 1988, 776). We used no additional lags on the events variable, because events are discrete occurrences that should affect the media and president immediately, but once the events have occurred, the stimulus is no longer present. The system should be free to work itself out as the president and media interact to interpret the relative significance of the events. Thus, the events variable provides a theoretical test for the manner and extent to which events instantaneously shock attention by the media and president to foreign policy issues. The events variable is also a statistical control for the hypothesis of spuriousness. That is, we can exclude the possibility that events definitively shape systemic or institutional attention, rather than the processes discussed above. The question we address after controlling for events is whether persistent attention by either the media or president has long-term effects on attention by the other actor.

THE DETERMINANTS OF U.S. FOREIGN POLICY ATTENTION

The determinants of attention to Soviet, Arab-Israeli, and Bosnian issues are so similar that a single discussion can pertain to all three analyses.¹² This similarity in findings suggests a certain theoretical consistency for the three issue areas. In particular, the analysis shows that events were extremely important in driving contemporaneous attention movements by both the president and media. Attention inertia was strong for both actors, and a definite pattern of influence emerged from media attention to presidential attention, but not in the opposite direction.

In all three vector autoregressions reported in Table 1, contemporaneous events are strongly significant at less than the 0.01 level. Of course, this consistently strong relationship shows that the economy of attention is often determined by occurrences external to both the media and presidency. Controlling for exogenous events, how did issue inertia, media attention, and presidential attention play out over time? Table 1 also reports the Granger tests for attention to the Soviet Union, Arab-Israeli conflict, and Bosnian conflict, respectively.

In each case, past media attention to an issue Granger causes current media attention to the same issue, and past presidential attention also Granger causes current presidential attention.¹³ Thus, as our

⁹ We do not mean to imply here that the omission of relevant independent variables is not a problem in VAR. It can be. Disturbances can be random with respect to time but not random with respect to the dependent variables. Relevant to this point is whether the VAR should contain a congressional variable. Of course, theory suggests that continuous congressional influence on foreign policy attention should be less than that for the president. Edwards and Wood (1997) tested for the presence of congressional influence for two of the same issues and found none. See also Bartels (1996) for similar null findings.

¹⁰ Based on Simms' (1980) methods for determining the appropriate lag length, we included in the Soviet and Arab-Israeli VARs four weekly lags for the media and presidential variables. We included five lags of these variables for the Bosnian conflict VAR. The Simms procedure entails sequentially adding lags to the VAR system and testing the statistical significance of each additional lag using a modified *F* test. We tested lags from 1 through 8 for the VAR system and arrived at the lag lengths reported below. We also did sensitivity testing to determine the effects of including additional lags up to eight weeks. Longer lag lengths diminished marginally the probabilities associated with the reported findings, but in all cases relations were stable and consistent. Residuals from final analyses were nonautocorrelated and normally distributed.

¹¹ To facilitate interpretation of the moving average responses, and because the variables had no natural metric, we standardized all variables prior to the analysis. All initial shocks are one standard deviation in magnitude. Because the innovations are correlated between variables, we plotted Choleski orthogonalized responses to simulated shocks of one standard deviation.

¹² The results were also reasonably consistent through time. In testing for coefficient stability, we did Chow tests as well as separate VARs for different presidencies. There were no substantively important differences across presidencies, but there were some differences in the magnitude of responses. Generally, President Reagan was somewhat less responsive on all three issues to the media than were presidents Bush and Clinton. All responses were in the same direction, however, and fully consistent with results reported below.

¹³ A variable *X* Granger causes a variable *Y* when, controlling for the history of *Y*, past lags of *X* covary with current values of *Y*. The standard approach to Granger testing involves selecting an appropriate common lag length to simulate an infinite order autoregressive disturbance process and then doing significance testing for the effects of lagged *X* on *Y*.

TABLE 1. Granger Tests for Attention to Three Foreign Policy Issues, Controlling for Related Events

Dependent Variable	Coefficient Block	Soviet Union	Arab-Israeli Conflict	Bosnian Conflict
Media Attention	Media	6.64 (0.00)	14.92 (0.00)	13.51 (0.00)
	President	1.49 (0.20)	0.89 (0.47)	1.61 (0.16)
	Events	371.71 (0.00)	129.96 (0.00)	70.73 (0.00)
Presidential Attention	Media	2.63 (0.03)	2.81 (0.02)	1.95 (0.09)
	President	5.21 (0.00)	2.40 (0.05)	5.31 (0.00)
	Events	134.56 (0.00)	36.24 (0.00)	26.63 (0.00)

Note: The numbers in the tables are *F* statistics; *p* values are in parentheses. The Soviet and Arab-Israeli VARs contain four lags. The Bosnian conflict VAR contains five lags. Events at lag 0 are included as an exogenous variable to control for the contemporaneous effect of events on both the media and president. There were 514 weekly observations in the Soviet and Arab-Israeli series, running from the 27th week of 1984 to the 23d week of 1994.

theory predicts, much of what the media and presidents attend to through time is determined by issue inertia and what they have attended to in the past. As new issues emerge, political actors are not free to choose attention levels. Rather, they must attend to issues of continuing importance until they are resolved or displaced in the economy of attention.

The Granger tests are also consistent in showing that media attention to the three issues is exogenous to presidential attention. The president does not Granger cause media attention to the Soviet Union, Arab-Israeli conflict, or Bosnian conflict. Theoretically, this implies that the president is not very successful in directing media attention to foreign policy issues; rather, issue inertia and the continual progression of world events seem to drive media attention. Yet, the media do Granger cause presidential attention for all three issues. This is, of course, consistent with a model of presidential attention that views the president as responsive to those issues on the systemic agenda. It also suggests a view of the president as responsive to cues from the policy environment in deciding which issues should receive priority in the economy of presidential attention. As the media and mass public become more concerned with an issue, the president also becomes more concerned.

The Granger tests provide evidence concerning the joint effects of lagged media attention while controlling for attention inertia and exogenous events. They provide no indication of the polarity of relations, however, or the dynamics associated with evolving attention processes. We can explore the dynamics of presidential responsiveness to the media by tracking out simulations from the VAR through time. Figure 1 plots the moving average responses of the media and president, respectively, when each variable is subjected to a simulated shock for all three issues. The first row of Figure 1 shows that a simulated shock to media attention produces an increase in presidential attention. In initial response to this shock, presidential attention to the issues shifts upward by about 0.20 (for the Bosnian

conflict) to around 0.40 (for the Soviet Union and Arab-Israeli conflict) standard deviations in the week after. The increase in presidential attention due to the media lasts for about two (for the Soviet Union) or three (for the Arab-Israeli and Bosnian conflicts) weeks, eventually returning to the preintervention equilibrium. In the other direction, the second row of Figure 1 shows that a shock of one standard deviation in presidential attention produces no systematic response by the media in either direction for any of the three issues. Thus, the president responds to the media, but the opposite relation does not occur.

COMPETITION IN THE ECONOMY OF ATTENTION

If presidential attention is a scarce resource, and if there is competition for presidential attention between multiple issues, then attention to an issue should change not only as a function of events, inertia, and media coverage of that same issue but also as a function of events associated with other issues. More specifically, as competing issues become more prominent in the economy of attention, attention to the primary issue should decline. A similar logic should also pertain to television news coverage and the media. Given the limited amount of time the TV evening news can devote to any one issue, it would not be surprising that as one issue becomes more visible another is squeezed out. For the president it is less clear that the squeeze should be as serious as for the TV evening news. The chief executive is under less pressure to balance coverage between domestic policy issues and foreign policy, so there may be attention to more than one foreign policy at a time by simply diminishing attention to domestic policy issues. The president also has much more than the standard half-hour of coverage for attending to foreign policy issues and may speak to many topics in one briefing, news conference, speech, or statement.

We can test the notion that competition exists

FIGURE 1. Simulated Moving Average Responses for Foreign Policy Attention Vector Autoregressions

among issues in the economy of attention using two different approaches. First, we can enter the events variable for competing issues exogenously into the VAR system of interest. If competition affects attention, then events from competing foreign policy issues should Granger cause and reduce attention to the primary issues. Second, we can identify some critical event associated with a competing foreign policy issue and do intervention analysis to determine whether the event reduced systemic and presidential attention to the primary issue. Using either approach, care is required in designing the test to assure that issues are orthogonal and actually competing for attention. For example, the stream of events associated with the Bosnian conflict may actually increase, rather than decrease, attention to the Soviet Union because of concerns that the former Soviet Union, due to long cultural and political ties to the Serbs, would react to U.S. involvement. Similarly, a critical event like the Persian Gulf War could increase attention to the Arab-Israeli conflict because of inseparability of the war from long-term conflict between the Arabs and Israelis. With these design constraints in mind, we employed both approaches to test for competition in the economy of attention.

We entered events for the Arab-Israeli conflict exogenously into the VAR for the Soviet Union and events for the Soviet Union and the Bosnian conflict exogenously into separate VARs for the Arab-Israeli conflict. Table 2 reports Granger tests from these

analyses. In the analysis for the Soviet Union, reported in column 1, there is clear evidence that competing events from the Arab-Israeli conflict affected attention by the media and president to the Soviet Union. The evidence is less clear from the Granger tests for the Arab-Israeli conflict. Competing events associated with the Soviet Union did Granger cause presidential attention to the Arab-Israeli conflict, but there is little evidence that competing events from the Bosnian conflict caused either media or presidential attention to the Arab-Israeli conflict.

The Granger tests are suggestive but do not reveal the direction of relations, which should be negative if the theory is correct. The simulation analyses reported in Figure 2 show the dynamics associated with shocks of one standard deviation to events from competing systems. Consistent with the Granger tests, column 1 of Figure 2 shows that both media and presidential attention to the Soviet Union diminished for some time after a positive shift in Arab-Israeli events. Column 2 demonstrates that media attention to the Arab-Israeli conflict diminished sharply when there was a positive shift in Soviet events.¹⁴ It also shows an initial decline in presidential attention to the Arab-Israeli conflict in response to Soviet events but suggests that three or four weeks later there was a resurgence of presidential attention. Of course, this

¹⁴ Note that this large negative response was invisible to the associated Granger test. Such a disparity may occur due to contemporaneous feedback through the covariance matrix of errors.

TABLE 2. Granger Tests for Attention to Two Foreign Policy Issues, Competing Events Included

Dependent Variable	Coefficient Block	Soviet Union Competing Events, Arab-Israeli Conflict	Arab-Israeli Conflict Competing Events, Soviet Union	Arab-Israeli Conflict Competing Events, Bosnian Conflict
Media Attention	Media	6.91 (0.00)	14.59 (0.00)	3.14 (0.02)
	President	1.67 (0.16)	0.96 (0.43)	1.62 (0.17)
	Competing Issue	2.14 (0.07)	0.20 (0.94)	1.51 (0.20)
Presidential Attention	Media	2.47 (0.04)	2.61 (0.03)	1.38 (0.24)
	President	5.17 (0.00)	2.18 (0.07)	0.72 (0.58)
	Competing Issue	1.99 (0.09)	2.95 (0.02)	0.37 (0.83)

Note: The numbers in the table are *F* statistics; *p* values are in parentheses. All VARs contain four lags. As in Table 1, events at lag 0 are included as an exogenous variable to control for the contemporaneous effect of events on both the media and president. There were 514 weekly observations in the Soviet and first Arab-Israeli series, running from the 27th week of 1984 to the 23d week of 1994. There were 155 weekly observations in the second Arab-Israeli series, running from the 25th week of 1991 to the 23d week of 1994.

resurgence is consistent with the *long-term* importance of Arab-Israeli issues over the period of interest. Column 3 shows a consistently small but negative response by both the media and president to events associated with the Bosnian conflict. Thus, in all three issue areas the simulations demonstrate negative movements, with responses that remain negative with few exceptions.

We also did intervention analyses to test whether single events associated with competing issues affected media and presidential attention to primary foreign policy issues. In order for such critical events to have an effect they must be large in magnitude; they must also be relatively orthogonal to the foreign policy issue of interest. For the Soviet Union issue we

FIGURE 2. Simulated Moving Average Responses to Shocks in Exogenous Issues

TABLE 3. Effect of Critical Events in Competing Issue Areas on Foreign Policy Attention

Variable/Parameter	Soviet Union		Arab-Israeli Conflict	
	Media Attention	Presidential Attention	Media Attention	Presidential Attention
Preintervention mean μ	27.78*** (5.34)	29.76*** (2.61)	26.78*** (7.61)	9.02*** (6.03)
Critical event ω_0	-28.45*** (-2.58)	-28.44 (-1.33)	-15.75* (-1.68)	-8.26* (-1.96)
δ_1	0.97*** (40.79)	0.96*** (15.05)	1.00*** (38.37)	1.00** (39.50)
Autoregressive ϕ_1	0.27* (1.84)	0.58*** (4.26)	0.21* (2.09)	0.26*** (2.58)
Box-Ljung Q with 23 d.f.	4.88	3.56	26.47	20.20

Note: There are 100 weekly observations in each series. The Soviet time series runs from the 1st week of 1990 through the 26th week of 1991. The Arab-Israeli time series runs from the 38th week of 1990 through the 33d week of 1992. The interventions were pulses. The values of the dynamic parameters (δ) for the Arab-Israeli conflict were rounded upward to 1.00 and did not exceed the bounds of stability. The "death" of the Soviet Union variable was lagged two weeks for the presidential attention equation. The numbers in parentheses are *t*-statistics.

* $p < .05$, ** $p < .01$, *** $p < .001$ (one tailed).

selected the beginning of the Persian Gulf War as having such characteristics.¹⁵ The Iraqi invasion of Kuwait occurred on August 2, 1990, and we hypothesized this date as the time attention should have shifted away from the Soviet Union. For the Arab-Israeli conflict we selected the announcement of the "death" of the Soviet Union and formation of a commonwealth of former Soviet republics. This announcement occurred on December 21, 1991, and dominated the news for the next several months. Accordingly, this competing event should have produced a subsequent decline in attention to the Arab-Israeli conflict.

We used Box-Tiao (1975) methods to evaluate how these critical events affected attention to the primary issues. The results for the Persian Gulf War, reported in the first two columns of Table 3, show an immediate and long-term decline in attention to the Soviet Union by both the media and president. Media and presidential attention to the Soviet Union (ω_0), dropped off to near zero in the week of the invasion and recovered very slowly through time. The results for the "death" of the Soviet Union, reported in the third and fourth columns of Table 3 (ω_0), show a similar negative decline in attention to the Arab-Israeli conflict by both the media and president following the announcement. In all four analyses the near unity rate of recovery parameters (δ_1) show that the effects would have been near permanent if other events had not occurred later to restore the primary issue to prominence in the economy of attention.¹⁶ Thus, the results uniformly

show that critical events associated with competing issues diminish foreign policy attention to primary issues by both the media and president.

CONCLUSION

The political science literature on agenda setting has been directed at explaining how U.S. domestic policy issues reach and remain on the systemic and institutional agendas. Yet, foreign policy is an important component of U.S. policymaking and has been largely ignored. This is undoubtedly because foreign policy is fundamentally different from domestic policy and requires a different rationale for explaining the rise and fall of issue attention. In this study we have advanced a theory of attention to foreign policy issues and then tested expectations that arise from that theory using empirical data.

In contrast to domestic policy, foreign policy is primarily centered on the presidency due to constitutional obligations, the need for strong centralized leadership, and expectations by the public and other institutions. Yet, the president is not in full control of what receives attention in the foreign policy domain. There is an economy of presidential attention that is governed by the realities of scarce resources and rational efforts by the president to garner favorable public approval and historical treatment. The chief executive can occasionally establish issue priorities in the economy of foreign policy attention (as Nixon did with China) but may also have an agenda thrust on him by problem persistence, a continual progression of events, and a perception that he must attend more heavily to those issues the public deems most important. The economy of attention is stable so long as

¹⁵ One could argue that this event was not orthogonal and that an increase in attention to the Soviet Union should have occurred at this time. Although the Soviet Union had been an ally of the Iraqi regime prior to the war, the changes occurring in the Soviet Union at about this same time diminished the likelihood of a Soviet reaction. Moreover, the Soviets actually cooperated with the United Nations in removing Sadaam Hussein's forces from Kuwait. Thus, we are comfortable in asserting orthogonality.

¹⁶ The level at any particular time after an intervention may be computed recursively using $y_t = \omega_0 + \delta_1 y_{t-1}$. Thus, prior to the Iraqi invasion of Kuwait, the amount of presidential attention to the Soviet Union resulted in about 29.76 paragraphs per week. The week of the invasion the number of paragraphs dropped to $y_t = -28.44 +$

29.76 = 1.32 paragraphs per week. Five weeks after the onset of the Persian Gulf War the number of paragraphs had risen to 6.57 per week; ten weeks after it was up to 10.85 per week; 26 weeks after it was 19.92 per week. Of course, other events and interventions can affect this mathematical sequence, moving attention either up or down through time.

issues persist and problems continue to be defined as important. Disturbances to this stability may occur, however, due to exogenous events or changing public perceptions of the relative importance of foreign policy problems.

Our empirical analysis is based on the three most visible and enduring U.S. foreign policy issues over the past 15 years. The limited number of issues that we examine suggests a need for future research which differentiates on the basis of issue salience, importance, or issue type. The empirical findings may also be limited because the measure for the president depends on the president's public rather than private or hidden agenda. Tentatively, however, our study confirms expectations that flow from the preceding theory.

Both presidential and systemic attention are highly inertial. The president attends heavily to those issues that have also been heavily attended to in the past, as does the media, which is an indicator of systemic attention. We presume that this observed inertia exists because foreign policy problems are not easy to resolve and because problems that are defined as important at one point are likely to remain so defined. Such problems also demand continuing presidential attention because the system defines certain problems to be important. Thus, presidents who want to be viewed in a favorable light attend to those problems toward which the system directs them.

Foreign policy attention is inertial, but this inertia is often disturbed by a continual progression of events associated with the issue itself. As foreign policy crises emerge, attention becomes more intense to the issue in proportion to the severity of foreign policy events. Attention also shifts due to changing media interpretations of events and the perceived relative importance of an issue. Intense media coverage of an issue can extend presidential attention to that issue for a longer period than is normal. Because the economy of attention involves scarcity, issue inertia is also often disturbed by competition from other foreign policy issues. Systemic and institutional attention shifts away from one issue toward another due to world events that alter perceptions of what issues are most important at the time. As issues in one area are perceived as more important, constraints imposed by limited time and resources necessarily mean that issues in other areas receive less attention.

In these regards, foreign policy differs sharply from domestic policy, since the progression of events is far more important. There is no analogous stream of domestic policy events similar to those that determine the context for attention to the Soviet Union, Arab-Israeli conflict, and Bosnian conflict. Whereas critical domestic policy events can occur and focus presidential attention for a time on particular issues, the foreign policy agenda operates in the context of a *continually* unfolding international drama. The drama depends on the media for production and interpretation. The president is drawn into the drama as an integral part, but he has no script and often must respond in impromptu fashion to media interpretations and the

continuous progression of events affecting U.S. interests.

APPENDIX

The following keywords were used to search the *Vanderbilt Television News Archive*. The list includes the words and the corresponding years in which they were used. Not all the stories that came up with these keywords were counted. We read the abstracts and coded the variables so that only those stories related to the Soviet Union, Arab-Israeli conflict, or the Bosnian conflict were part of the measure.

Year	Vanderbilt Key Words
Soviet Union	
1984	USSR, Soviet, Russia, Moscow, US-USSR rels., arms control, summit, nuclear weapons
1985	USSR, Soviet, Russia, Moscow, US-USSR rels., arms control, summit, nuclear weapons
1986	USSR, Soviet, Russia, Moscow, US-USSR rels., arms control, summit, nuclear weapons, Chérnoby, Gorbachev
1987	USSR, Soviet, Russia, Moscow, US-USSR rels., arms control, summit, nuclear weapons, Gorbachev
1988	USSR, Soviet, Russia, Moscow, US-USSR rels., arms control, summit, nuclear weapons, Gorbachev
1989	USSR, Soviet, Russia, Moscow, US-USSR rels., arms control, summit, nuclear weapons, Gorbachev
1990	USSR, Soviet, Russia, Moscow, US-USSR rels., arms control, summit, nuclear weapons, Republic, Gorbachev
1991	USSR, Soviet, Russia, Moscow, US-USSR rels., arms control, summit, nuclear weapons, Gorbachev, Yeltsin, Republic, Commonwealth
1992-94	USSR, Soviet, Russia, Moscow, US-USSR rels., arms control, summit, nuclear weapons, Yeltsin, Gorbachev, plus all 16 former Soviet states, besides Russia: Latvia, Lithuania, Estonia, Azerbaijan, Mongolia, Kazakhstan, Tajikistan, Moldova, Belarus, Armenia, Ukraine, Uzbekistan, Turkmenistan, Kyrgyzstan, Georgia, Kurdistan
Arab-Israeli	
1984-94	Israel, Jerusalem, Tel Aviv, Syria, Lebanon, Jordan, Egypt, PLO, Arafat, Palestine, Palestinian, Arab-Israeli, terrorism, intifada, W. Bank, Gaza, Golan, occupied
Bosnia	
1991-95	Yugoslavia, Bosnia, Bosnia-Herzegovina, Serbia, Croatia, Slovenia, Sarajevo, civil war, embargo, ethnic cleansing, Moslem, Croat, Serb, Balkans

The keywords for the index of the *Public Papers of the President* are provided in the following list. All the entries mentioned in the index were read to ensure validity for inclusion as attention to the Soviet Union, Arab-Israeli conflict, and Bosnian conflict.

Year	Public Papers Key Words
Soviet Union	
1984–90	United Soviet Socialist Republics (all concurrent listings), nuclear weapons (all concurrent listings), arms control, Afghanistan, any mention of Soviets in any other listing in the Index (i.e., Middle East—Soviet Role)
1991–94	Same as above, except no Afghanistan, and included: Commonwealth of Independent States (all concurrent listings), Estonia, Latvia, Lithuania
Arab-Israeli	
1984–94	Israel, Jordan, Syria, Egypt, Lebanon, Middle East (having to do with conflict or terrorism), terrorism (dealing with the Middle East), and all “see also”
Bosnia	
1991–95	Bosnia (all subheadings), Macedonia, Croatia, Serbia, Yugoslavia, Montenegro

The following keywords were used for searching the PANDA events data set within a database environment (Microsoft Access). Abbreviations were used per the codes. These correspond to targets, sources, and places.

Year	PANDA Key Words
Soviet Union	
1984–94	Armenia, Azerbaijan, Belarus, Estonia, Georgia, Kazakhstan, Kurdistan, Kyrgystan, Latvia, Lithuania, Moldova, Mongolia, Russia, Tajikistan, Turkmenistan, Ukraine, USSR, Uzbekistan
Arab-Israeli	
1984–94	Israel, Jordan, Palestine, Syria, Egypt, Lebanon
Bosnia	
1991–95	Bosnia, Yugoslavia, Croatia, Serbia, Montenegro, Macedonia

Beliefs in Government, Volume One: Citizens and the State. Edited by Hans-Dieter Klingemann and Dieter Fuchs. New York: Oxford University Press, 1995. 360p. \$65.00.

Beliefs in Government, Volume Two: Public Opinion and Internationalized Governance. Edited by Oskar Niedermayer and Richard Sinnott. New York: Oxford University Press, 1995. 512p. \$65.00

Beliefs in Government, Volume Three: The Scope of Government. Edited by Ole Borre and Elinor Scarbrough. New York: Oxford University Press, 1995. 464p. \$65.00.

Beliefs in Government, Volume Four: The Impact of Values. Edited by Jan W. van Deth and Elinor Scarbrough. New York: Oxford University Press, 1995. 608p. \$65.00

Beliefs in Government, Volume Five: Beliefs in Government. By Max Kaase and Kenneth Newton. New York: Oxford University Press, 1995. 200p. \$45.00.

This monumental five-volume series, written by leading European political scientists, presents a comprehensive analysis of the role of mass publics in political life. The result of a unique program in cross-national collaborative research, it constitutes an important event in the development of transnational social science. Produced under the general editorship of Max Kaase, Kenneth Newton, and Elinor Scarbrough, these volumes are the product of the Beliefs in Government Research Program sponsored by the European Science Foundation, which funded the five-year program. The final product is the work of fifty-five authors from sixteen countries.

The general aim of the project was "a study of changing mass attitudes towards government in Western Europe in the post-war period" (Kaase and Newton, v. 5, 1). A key methodological decision was to base the entire project upon a reconsideration and reanalysis of available survey data. Kaase and Newton explain that the availability of the biannual Eurobarometer data was the major factor leading to the decision to conduct this project, and those data provide the main source for the analyses. The origins of the Eurobarometer surveys have been described in Reif and Inglehart (1991); they now constitute one of the most widely used data sets archived by the Inter-university Consortium for Political and Social Research in Ann Arbor. Other data sets are used in these volumes, the most important being the 1981–83 and 1990–91 World Values Surveys and surveys conducted by the International Social Science Program (ISSP) in 1985 and 1990. But the Eurobarometer data provide the most extensive time series, together with a wide range of cross-national

comparisons. Nevertheless, these data are limited: They normally sample only members (or future members) of the European Union, and the survey content often reflects the specific policy needs of EU decision makers and not necessarily the broader range of scholarly interests.

Kaase and Newton point out that "it would have been enormously attractive and desirable to organize the analysis around a tightly knit and broadly conceived theoretical framework" (v. 5, 8). For example, they could have attempted to marry David Easton's (1965) theoretical distinction among the authorities, regime, and community with Gabriel A. Almond and Sidney Verba's (1963) empirical analysis distinguishing among the system, inputs, outputs, and the self. But, as they correctly note, although it was a theoretical breakthrough, *The Civic Culture* led neither to a sustained effort to develop the theoretical underpinnings of the concept of political culture nor to a systematic account of how political cultures change over time. Although Easton's theoretical distinction among objects of support is highly suggestive, and although it is used in the empirical analysis, public opinion researchers have found it difficult to distinguish operationally among these objects. Likewise, as Kaase and Newton point out, it would have been useful to study elite attitudes toward government, but there are too few studies of elites, let alone comparative studies, to permit such comparisons.

As a result of these theoretical and data limitations, the Beliefs in Government project necessarily follows an eclectic approach and is largely guided by past research on West European politics. The authors take a broad view of government and include not only the groups or parties that hold political power. Rather, the term *government* "has a much broader meaning and covers all the political institutions of the executive, the legislative, and the judiciary and their associated activities, decisions, and outputs." The study itself deals with "the attitudes of individual citizens which directly and indirectly relate to their role in the political process, their views of individual and corporate political actors, and their assessment of the institutions of government and its democratic rules of the game" (Kaase and Newton, v. 5, 8).

The project makes an extremely valuable contribution to the research literature on comparative politics. The vast majority of our own work has focused on political attitudes among mass publics, and our natural inclination is to be sympathetic to this enterprise. We will begin by providing an overview of the five-volume study and then provide our own conclusions about its implications for future research in comparative politics and for the future of democratic politics in Western societies.

Note: The authors thank an anonymous reviewer for his helpful suggestions.

THE FIVE VOLUMES

The first four volumes contain many chapters that students of European politics and comparative public opinion will find valuable. The fifth volume, coauthored by Kaase and Newton, provides a useful overall perspective on the research. Space constraints make it impossible to discuss each chapter's contributions in any detail.

Citizens and the State focuses on the question: "Does contemporary politics pose a challenge to representative democracy?" Responding to a set of theories that postulate a legitimization crisis of late capitalism (Habermas 1973), a crisis of governability (King 1975), or a crisis of democracy (Crozier, Huntington, and Watanuki 1975), the authors analyze a massive body of cross-nationally comparable data in order to determine whether such factors as changing values and cognitive mobilization have undermined mass support for representative democracy. Summing up the findings from various analyses in this volume, Dieter Fuchs and Hans-Dieter Klingemann conclude that citizens have indeed changed during the postwar years, but representative democratic institutions have responded and adapted to these changes in ways that have maintained mass support. One of their most interesting findings is that, from 1970 to 1990, postmaterialists and Europeans with high levels of cognitive mobilization increased most in their relative levels of system support and trust in government: Relatively disaffected at the start of this period, they became increasingly integrated into the system. This was a major achievement. Fuchs and Klingemann attribute this development to widespread policy changes that were made in West European countries. Political leaders adopted key elements of the postmaterialist agenda. For example, there was a massive increase in emphasis on environmental protection policies, which rose from relative obscurity to play a prominent political role, overshadowing emphasis on traditional socialist economic policies by the 1990s.

Klingemann compares the issue positions taken by political party elites with those of their mass electorates. He finds that, across Western Europe as a whole, the parties of the Right have behaved according to Anthony Downs's theory: They moved to the political center, where the votes are concentrated. But the parties of the Left did not. Depending upon one's ideological perspective, they may be described as more sincere or as more ideologically rigid than those of the Right, but in any case they tended to take issue positions that were more extreme than those of their own electorates and of voters in general.

In a contribution that is particularly interesting in light of widespread concern about declining electoral participation in the United States, Richard Topf concludes that West European voter turnout has *not* declined in recent decades. Actually, Topf's own analysis indicates that across Western Europe as a whole electoral participation *did* decline, although only by an overall mean of four percentage points—which he dismisses as insignificant. But this change may be more significant than Topf realizes. During this period, West

European countries experienced a tremendous increase in the proportion of the electorate with secondary and higher levels of education, and the average age of the electorate was rising. Both factors tend to be associated with a higher rate of electoral participation and may have been expected to produce a substantial *increase* in voter turnout. Since turnout actually declined in most countries, demobilizing forces (perhaps a diminishing ability of established parties to control their electorates) must have been at work. In contrast with this finding, and in keeping with the thesis that long-term value changes and demographic changes should tend to increase political participation rates, Topf finds that nonelectoral participation has increased dramatically. Moreover, the repertory of acceptable political action has broadened since the 1960s to include a number of direct and uninstitutionalized forms of action, such as petitions, demonstrations, and political boycotts. Only electoral participation (a highly institutionalized and elite-directed form of action) has stagnated or declined.

Hermann Schmitt and Sören Holmberg examine the thesis that new forms of interest mediation are challenging the functions of political parties and that the links between parties and people have been weakening. They find an overall decline in partisan loyalties across Western Europe, but the depth and speed of this development vary considerably from one country and one period to another. For example, in the new democracies of southern Europe there has actually been a modest growth of partisanship. Sweeping theories about the decline of partisanship, they conclude, must be qualified by examining specific cases.

This volume presents a wealth of fascinating findings that often qualify broad theories of social change, reminding us that empirical reality is complex. Overall, the findings indicate that, despite major social, cultural, and economic changes, West European democracies have maintained high levels of political legitimacy, contrary to predictions of a legitimacy crisis, ungovernability, and overload. Democratic institutions and actors seem to be more flexible and more responsive to social change than these theories anticipated.

The second volume focuses on international governance and mainly upon attitudes toward the European Community. It relies heavily upon the Eurobarometer data, although it also provides interesting results from East Europe based upon an East European Eurobarometer conducted in 1990. Richard Sinnott provides a useful discussion of the European integration literature, including a critique of neofunctionalist theories. He emphasizes the need to study mass political attitudes, noting that political developments since 1989 have underscored the importance of understanding public opinion. Oskar Niedermayer and Bettina Westle provide an interesting typology of orientations, drawing largely upon a reformulation of Easton and Almond and Verba. The utility of this typology in actual analysis is not very clear, however. Several chapters point to differences in question wording that create problems for studying trends, and as Niedermayer makes clear, the actual questions used are often diffi-

cult to relate to the typology of orientations that is intended to provide the framework for analysis. The data strongly suggest widespread support for European integration but no growing sense of European identity among the mass public. The data suggest an increase in European identity between 1982 and 1986, followed by a decline until 1990, a brief recovery in 1991, and a general decline in 1992. Niedermayer's analysis suggests that trust is centered on the nation-state. Still, there has been a growing sense of trust among members of the EU. And there is public support both for enlargement of the EU and extended military cooperation in NATO.

Bernhard Wessel's analysis of the correlates of support for European integration is especially interesting. He specifically contrasts Inglehart's argument (originally advanced in 1967) that generational replacement among the West European public would gradually lead to support for European integration with the thesis that change results from intrasocietal diffusion. Based upon his analysis of the Eurobarometer surveys, Wessel concludes that age differences in support for European integration are not strong or consistent enough to support a generational replacement explanation. Instead, the results of his analysis suggest that diffusion processes are more important. Since Wessel's analysis of diffusion processes is based largely upon inferences about the declining relationship of socioeconomic factors to attitudes toward European integration, the data supporting his conclusions are indirect, but his chapter provides an interesting and valuable study of the dynamics of attitude change.

The chapter by Frank Aarebrot, Sten Berglund, and Thomas Weninger analyzing attitudes in Austria, Finland, Norway, Sweden, and Switzerland toward the European Community is also interesting, particularly when they examine the decision of Norwegian voters in 1994 not to join the EU. Based upon a European integration study conducted in these countries in 1992 (coordinated with Eurobarometer No. 37), it seems the Norwegian public is not very different from other West European publics, although Norwegians were less likely to believe that their country would benefit from membership. Another difference may help account for the Norwegian defeat of EU membership. In Denmark, Finland, Austria, and Sweden, respondents who felt informed about the EC were more likely to support European integration. In Norway, opponents of membership felt as informed as supporters of membership. The authors attribute this relationship to the presence in Norway of a strong and well-organized mass movement against membership. Norway has often been studied as a deviant case in a wide variety of contexts, from the maintenance of stable democratic institutions to the dynamics of coalition formation. Obviously, a broadly comparative volume does not leave much space for deviant case analysis.

The third volume of the series differentiates between the "range" of government activity and its "degree." As Ole Borre and Michael Goldsmith use these terms, *range* refers to "the whole gamut of government activities, such as spending on services, taxing people,

regulating their behavior, providing for defense, improving the environment," whereas *degree* means "the intensity with which government pursues a particular activity" (v. 3, 4). Contributors to this volume rely heavily upon the Eurobarometer surveys but also employ surveys sponsored in 1985 and 1990 by the ISSP, as well as the two Political Action surveys conducted in 1973–76 and 1979–81, and they occasionally use national surveys, such as the British Election Studies. But there are substantial limitations, and, as Borre and Goldsmith write: "Perhaps more than the other concerns of the Beliefs in Government project, our topic reveals the lack of systematic comparative survey data" on this topic (v. 3, 14). Indeed, throughout this volume the authors express frustration about the lack of longitudinally comparable data. Nevertheless, the sensitivity of these scholars to these problems gives more credibility to the patterns that they do discover.

The contributors carefully document both governmental growth itself and the demographic changes that have contributed to this growth. The thesis that government overload has led to a decline in support for government involvement receives little support, except perhaps in The Netherlands in the early 1980s. Maria A. Confalonieri and Kenneth Newton provide an especially interesting chapter on attitudes toward taxation, although their data are limited to the two relevant ISSP surveys, which reduces their ability to study trends. Their overall conclusion, drawing upon the entire Beliefs in Government project, is that there is a good deal of evidence that public faith in politicians has declined in some West European countries, but there is still substantial support for the political community and the regime. They find "very little evidence to suggest a tax revolt which would undermine the principles of the modern welfare state" (v. 3, 146).

At a more macroanalytic level, Edeltraud Roller finds no relationship between national living standards and support for socioeconomic equality. Per Arnt Pettersen specifically examines support for the welfare state, relying heavily upon the British Election Studies. He finds generally stable levels of support. This holds true in Scandinavia, except for Finland, where limited data suggest declining support. The major conclusion is that there is no hard-core opposition to the welfare state. In fact, "there is no evidence that the welfare states, or specific welfare programmes, are generally losing support over time" (v. 3, 229). Olof Johansson's discussion of support for protecting the environment is interesting, even though, given data limitations, he was not able to examine questions about the priority of environmental protection as compared with other issues. Nevertheless, Johansson presents a typology combining values and views of economic expansion that may prove useful in future studies of environmentalism.

The bottom-line conclusion to emerge from *The Scope of Government* is that there is little support for major changes in the welfare state, no evidence of a tax revolt, and little evidence that Western governments have succumbed to a "crisis of legitimacy." Yet, this volume, more than the other four, underscores some of

the limitations of available survey data. Indeed, at one point Borre laments: "In view of the inadequacy of our data on many important points, one may well wonder whether beliefs about the scope of government is a worthwhile topic of study" (v. 3, 384). We think it is a worthwhile enterprise, even if the authors of this volume were often forced to rely upon fragmentary evidence.

Volume four focuses on three major value dimensions and their effect on mass publics: (1) religious-secular values; (2) materialist/postmaterialist values; and (3) the materialist Left-Right dimension. The contributions make certain key findings clear. First, there has been a pervasive decline in religious values. Wolfgang Jagodzinski and Karel Dobbelaere first demonstrate this trend and then imaginatively test a number of hypotheses about why this change has occurred. Second, there has been a shift from materialist to postmaterialist values, as Scarbrough documents convincingly. Third, Left-Right materialist values have persisted with considerably more continuity than is generally believed. Despite journalistic claims to the contrary, there has been no significant shift toward the Right, as Oddbjørn Knutsen makes clear. What has happened instead has been a redefinition of what Left and Right connote.

The authors find substantial intergenerational differences. Younger people tend to be more secular, more postmaterialist, and more likely to identify with the materialist Left than are their elders. They also tend to be more supportive of ecological and feminist movements and more libertarian than older respondents. These differences seem to be linked with long-term change. But here again, the authors draw a relatively differentiated picture of what has been happening, distancing themselves from claims of a monolithic shift in any one specific direction. In the concluding chapter, Jan W. van Deth and Scarbrough argue that it is more accurate to speak of "value changes" than of "value change," for a number of different changes are taking place. The overall picture is one of growing value heterogeneity that may make the job of governing increasingly difficult, although the authors conclude that democratic institutions are good at adapting to challenges.

One inherent virtue of democracies is that parties and politicians must adapt to changes in the electorate. If they do not, then they are not reelected.

The authors of this volume emphasize the analytic primacy of values in explanations of political change. For example, Knutsen finds that values have a stronger effect on European voting behavior than do social structural variables. Moreover, structural voting is a more important factor in the less advanced industrial societies than in the most advanced, a finding that has interesting developmental implications. Values also play a significant role in shaping concerns about environmental pollution and participation in environment-saving activities (though, as Masja Nas emphasizes, values are not the only factor involved). Values help shape political interest and involvement, as Oscar W. Gabriel and van Deth demonstrate; and they have a

major influence on grass-roots political activity, as Peter Gundelach makes clear.

In the analysis of social change, there is no substitute for time-series data. This volume draws on an unusually extensive time series, using it in new ways in order to carry out critical reevaluations of previous work—including our own. The authors present some thoughtful and well-reasoned criticism of the theory of intergenerational value change first proposed by Inglehart in 1971, which argued that a shift from materialist to postmaterialist values was taking place in advanced industrial societies and was driven by intergenerational value change.

This claim was controversial at the time, and scores of articles and books have attacked the thesis. The most widespread alternative interpretation was that the observed age differences were not a permanent part of the outlook of the younger birth cohorts, but simply a life-cycle difference that would fade as the younger cohorts aged. The intergenerational replacement thesis implied that a long-term shift in prevailing values would occur as the young replaced the older cohorts; the life-cycle interpretation implied that no value change was taking place. The evidence in our view (Abramson and Inglehart 1995) strongly suggests that the shift from materialist to postmaterialist values in Western Europe largely results from generational replacement.

Although this volume contains contributions by some of Inglehart's most prominent earlier critics, one of its main conclusions is that the shift from materialist to postmaterialist values is indeed taking place. Thus, although proposing alternative interpretations of Inglehart's findings, Scarbrough's evaluation of the empirical evidence concludes: "Indisputably, across much of Western Europe, value orientations are shifting" (v. 4, 156). "The potency of postmaterialist theory lies in providing us with one of the few explicated accounts of value change in contemporary West European societies" (v. 4, 157). The debate about the value change thesis has changed. The issue is no longer whether an intergenerational value shift is taking place but *why*. The authors of this volume examine a variety of alternative explanations.

Various analyses in this massive work explore the effect of postmaterialist values on political behavior. Summing up the findings from the five volumes, Kaase and Newton conclude: "We find substantial support for the model which traces social changes to value changes, and value changes into changes in political attitudes and behaviors, especially through the process of intergenerational replacement It is clear that the decline of religious values and the rise of postmaterialist values have transformed the cultural composition of Western democracies in recent decades" (v. 5, 63).

CONCLUSION

Continuity and longitudinal comparability are crucial to the cumulative progress of social science research. In ongoing research projects there is always tension between scholars who strive for maintaining compara-

bility over time and those who stress the need for innovation. We tend to side with those who see the need for maintaining comparability (see Abramson 1990), but at the same time we recognize that some of the more innovative developments in survey research employ new techniques (Sniderman 1993, Sniderman et al. 1991). Tradeoffs between comparability and innovation will be increasingly difficult in an era of declining resources to support social science research. The goal of maintaining comparability over time is especially difficult to attain in cross-national research. Scholars must constantly be aware of changes in question wording and changing contextual effects. On balance, the *Beliefs in Government* series provides one of the most ambitious examples of secondary data analysis in social science research, and it highlights both the strengths and limitations of this approach. The strengths are impressive. Although future research will need to address new problems that Western publics will face in the post-Cold War era, it is essential to maintain longitudinal comparability. The authors of this work do so in exemplary fashion, applying a healthy dose of skeptical criticism to our own work and that of other students of social change.

The study also highlights the strengths of cross-national cooperation. The scholars who contributed to this volume represent a wide range of European countries, and their specific country-level expertise often leads to interesting insights. These scholars were heavily influenced by American political science research in their choice of topics and the analytical strategies pursued, but they bring a wide variety of perspectives to bear on their interpretations. Though very few data from the United States or Canada are presented, students of North American politics have much to learn from these volumes. Unfortunately, the dearth of material on the United States seems likely to limit the readership of these volumes in this country. Despite a growing dissatisfaction with the compartmentalization of comparative politics into area studies (Bates 1997, Lustick 1997; for a dissenting view, see Johnson 1997), students of American politics tend to remain overly parochial. This is unfortunate, for the research in the *Beliefs in Government* volumes provides important insights for public opinion researchers in the United States. Students of American politics need to account for the very high level of political cynicism in the United States as well as the remarkably low level of electoral participation. The fourth volume, *The Impact of Values*, seems particularly valuable for placing these questions into a broader comparative perspective.

The substantive findings that emerge from the *Beliefs in Government* project are encouraging for supporters of democracy. During the postwar years, Western governments have faced many problems, and the nature of these problems will doubtless change in the post-Cold War era. All the same, we concur with Kaase and Newton's optimistic conclusion: "The lesson of the *Beliefs in Government* research is that democracies can stand considerable internal and external pressure while at the same time adjusting to changing environments" (v. 5, 16). The end of the Cold War,

they argue, has created a new era for Western Europe. But, they say, "our speculation is that after an initial period of irritation and disorientation, liberal democracies will measure themselves against fresh challenges—religious, cultural, environmental, for example—and survive by adapting" (v. 5, 16). We share this optimism, at least for the established democracies of Western Europe, North America, and Japan.

This optimism seems to present a sharp contrast with the earlier thesis that democracy was undergoing a crisis of governability. The evidence that Western political systems may face problems of governability has by no means disappeared. During the past forty years there has been a massive decline in trust in government among the U.S. public. This trend abated during the 1980s, but trust fell again during the 1990s. In 1994, according to National Election Study surveys, the American people's trust in government was at an all-time low, even though unemployment was low, inflation was moderate, economic growth was high, and crime rates were falling. Trust did rise between 1994 and 1996, but the increase was relatively small. The decline in political trust has given rise to a good deal of scholarly debate (see Abramson 1983; Craig 1993; Nye, Zelikow, and King 1997).

Declining trust in government does not seem to be limited to the United States. Russell J. Dalton (1996) and Ronald Inglehart (1997) find that public confidence in political elites and hierarchical institutions has been eroding, as part of a pervasive decline in deference to authority that can be seen throughout advanced industrial society. The large vote for Perot in 1992 and the erosion in support for established ruling parties, from Italy to Japan, seem to be symptoms of this process. Similarly, Dalton (1997), using the longest possible time series, finds a decline in party identification in eighteen of the twenty countries for which data are available for the past two to four decades. As Robert Michels pointed out decades ago, political parties are inherently oligarchical, and support for such institutions seems to be declining.

How can we square these findings with the trendless fluctuations in support for the political system reported by the authors of *Beliefs in Government*? The main variable in their trend analysis is based on the question: "Are you very satisfied, fairly satisfied, not very satisfied or not at all satisfied with the way democracy is functioning in (respondent's country)?" This question was first asked in the 1973 EC survey and was used repeatedly in subsequent Eurobarometers and other surveys; an exceptionally large body of time-series data is available.

This is a hybrid question. It refers to "democracy," and insofar as the responses are evaluations of *democracy*, we would expect to find a rising trend, not a falling trend over time. As Inglehart (1990, 1997) has argued, economic development tends to bring rising support for democracy; we wholeheartedly concur with the authors of *Citizens and the State* that support for democracy has not eroded over time.

But the "satisfaction with democracy" question does not just tap support for democracy: It *also* reflects current economic conditions; its level falls during re-

cessions and rises with economic recovery. Moreover, this variable taps satisfaction with the authorities currently in power. When a government of the Left is in office, respondents who prefer the Left show higher levels of satisfaction; when a government of the Right is in power, Right-leaning respondents show higher levels of satisfaction. Because this variable reflects current conditions, we would expect it to show short-term fluctuations. And any tendency for people to show diminishing support for hierarchical authorities in their country tends to be offset because the other half of this hybrid variable does tap support for democracy—which tends to be *rising*.

Are mass publics losing confidence in democracy itself? The analyses presented here indicate that the answer is “no.” On the contrary, the same publics that are becoming increasingly critical of hierarchical authority are becoming increasingly resistant to authoritarian government, more interested in politics, and more apt to play an active political role. Although hierarchical political parties are losing control over their electorates, and elite-directed forms of political participation such as voting are stagnant or declining, elite-challenging forms of political participation are becoming more widespread. And though they tend to distrust political authority and big government, the publics of advanced industrial societies value democracy more, not less, than the publics of less secure societies. The changes *do* make life more difficult for the governing elites. But they do not undermine democracy; within reasonable limits, they tend to make it more secure.

Can the decline in respect for authority go to such an extreme that it undermines the stability of democracy, rendering democratic societies ungovernable? It seems conceivable. Harry Eckstein (1966, 1996) has argued that, to function well, democracy requires a mixture of activism and respect for authority (cf. Almond and Verba 1963). A total rejection of authority could render democracy ungovernable, as the crisis-of-democracy critics have argued. This has not occurred, and whether it occurs in the future remains to be seen. As the authors of the *Beliefs in Government* volumes demonstrate, thus far democratic societies have shown an impressive capacity to adapt to new challenges.

Published in the waning days of Aid to Families with Dependent Children (AFDC), these books on social policy, poverty, and the welfare state provide reminders that policy studies and political science have been awkward dance partners for the past half-century. As a coarse rule, policy analysts, especially in schools of public policy and public administration, produce analytically guided case descriptions rather than the tools themselves. Their orientation to theory and history tends either to be starkly instrumental or purely normative. By contrast, political scientists who write about policy are disposed to muster their cases to illustrate or test deductive theory, furnish units for quantitative or qualitative multivariate manipulation, or validate propositions about structure, process, and behavior rather than participate in policy debates. If policy analysts aspire to influence in current affairs, political scientists primarily want to advance the discipline.¹ Inevitably, there is a lot of stepping on toes.

My purpose in this essay is to ask whether and how

¹ A careful reader will discern that in the first parts of the text I refer to "policy analyses" and "policy studies" but not to "policy sciences," a term I reserve for the essay's conclusion. I make this distinction for two reasons. First, I want to underscore the advantageous characteristics of the insufficiently attended approach to public policy advocated by Harold Lasswell, who used the designation "policy sciences." Second, my sharp criticisms of the qualities of much work in the policy field are not targeted here on the more Lasswellian tendency, which has adopted the policy sciences label in its journal and in the name of its professional association. That said, I also want to distance myself from the arcane world of Lasswell scholarship, which debates exactly what he meant and intended in his often opaque writing, much of which, alas, remains out of print and difficult to find. Still useful for an overview of the policy literature is Nagel 1984.

historical institutionalism may better choreograph interaction by students of American politics and policy to the advantage of both. There are good reasons to think it can. In recent years, a growing number of political scientists who self-identify as historical institutionalists have transformed scholarship on social policy by privileging the formative capacity of specific institutional legacies and arrangements (Dunlavy 1993; Hattam 1993; Immergut 1992, 1996; Koelble 1995; Pierson 1994; Steinmo 1993; Steinmo, Thelen, and Longstreth 1992; Weir 1992). While advancing their subfields of comparative and American politics, they also have sought to influence studies of public policy, aiming, as Finegold and Skocpol put it, to "grasp the true choices and the actual possibilities that face...makers of public policies for the future" (p. 242).

It makes sense, therefore, to think about the achievements and promise of historical institutionalism in the context of considerations of welfare and social policy, one of this school's favored set of subjects, juxtaposed to more conventional ways of working and to other critiques of policy studies. The books under review cluster in three categories. Norris and Thompson's collection of essays on welfare reform in six states and Handler's critical explication of the terms of the recent welfare debate directly address the last years of AFDC. Schram and Katz generate vigorous challenges to the customary ways scholars study welfare and poverty. In partnership with Finegold and on her own, Skocpol mounts the case for an alternative grounded in history and focused on institutions.

The first set, read with and against the intentions of its authors, and the second, scanned for antidotes to complacency, disclose unsatisfactory features of domestic policy studies; not least their flat use of history and uncoordinated orchestration with the concerns, methods, and analytical torque of political science. The third makes a resourceful, exigent case for historical institutionalism with which I am in keen sympathy and much agreement. Notwithstanding, I dispute the encircled qualities of Skocpol's and Finegold's research program, arguing its enclosure cobbles its persuasiveness as an advertisement for the approach they advocate.

AFDC AS TRACER

Though the scale of AFDC as part of the federal enterprise at the time of its demise was small (spending, on a matching basis, approximately \$17 billion of federal funds in 1995), its repeal, capping a period of innovation at the state level inaugurated by the call for experimentation in the Family Assistance Act of 1988, condensed important trends crying out for analysis: the transformation of American federalism; a practical and

symbolic assault on the once secure New Deal welfare state and its Great Society elaboration; changes to the contours of race relations and the social geography of poverty; shifts in the center of gravity of ideological debate about the respective roles of governments, markets, and communities; and a host of normative and instrumental issues at the heart of liberal theory concerning representation, citizenship, and diversity. Set beside these challenging subjects, Norris and Thompson's accumulation of case materials and Handler's screed against current policy trends provide disappointing reminders that the great bulk of extant work on public policy combines semitheoretical description with policy advocacy weakened by the absence of analytical bite.

The Politics of Welfare Reform, seeking "to understand the specific processes by which the current wave of welfare reform has grown" (p. 3) usefully can be read as emblematic of the strengths and weaknesses of the vast majority of only loosely theoretical policy studies. Chock full of germane information about how various states responded to the 1988 invitation to apply for waivers from federal rules, the book collects papers treating a cross-section of welfare policy history over the course of a single two- to three-year wave of reform in one western (California), three midwestern (Wisconsin, Michigan, and Ohio), and two eastern (New Jersey and Maryland) states. As cases situated inside a slack application of Eastonian systems analysis, these stories tell sad tales about insufficient organizational capacity at the state level, the absence of prospective analysis and poor planning by policy elites, and the short-term political horizons of politicians whose courtship of opinion failed to challenge wrong-headed features of conventional wisdom about race and poverty. Perhaps the most coherent finding is that devolutionist welfare reform has been concerned rather more with ideology and political jockeying than with addressing poverty.

What to do? Norris and Thompson direct their advice to policymakers, offering only a series of anodyne pleas: "Turn down the volume of ideological debate"; "employ elements of a more rational process"; "suspend ideology, moralism, and political agendas"; and propose "reforms which should address real problems" (pp. 236-7). Having rehearsed, with their collaborators, how just these hopes have been contravened, they offer no structural or agency-centered analyses of causes or mechanisms. They strike a legitimizing tone which opposes science to normative purpose. Overall, there is little theory, only a weak specification for the selection of cases, very limited comparison, and imprecise conclusions. The "principal lessons" of the concluding chapter are models of equivocation: "The politics of welfare reform in the states were remarkably similar and remarkably different. . . . Different actors and institutions with different relevant strengths played roles in the politics of welfare reform" (p. 229).

This kind of slack though well-intentioned brief for rational policy intervention is one of the main targets of Schram's robust critique of the limited scope and

top-down empiricism characteristic of much policy analysis. His *Words of Welfare*, a collection of vigorous essays written over the course of a decade, scores many points. He discerningly excoriates the credulous qualities of neutered research once inserted into fields of stratification and power. He demands that students of policy come to grips with their pivotal role in the policy process. He insists they invert or at least extend their conventional research to focus attention on the effect of policy as seen from the bottom reaches of society.

Schram goes farther. He claims that policy research based on premises of rationality and systematic social science necessarily contributes to the perpetuation of suffering by reproducing the "economistic-therapeutic-managerial discourse" (p. 4) on which current policies depend. As an alternative, he combines modernist studies of ideology with more thoroughgoing anti-science postmodernist theories of signification to promote a different discourse as the basis for a self-critical social science of poverty capable of assisting, if not guiding, social change.

This project is characterized by three main flaws. First, it commits the sin of overaggregation. "Rationality" becomes such a broad covering term that it encompasses virtually every type of policy analysis. Any differences that exist, say, between Charles Murray, who has advocated the complete elimination of federal income supports, and William Julius Wilson, who advances a social democratic program geared to problems of ghetto disemployment (Murray 1984, Wilson 1996), disappear in Schram's discussion, which places both scholars inside an undifferentiated diatribe against "neutered analysis for a managerial state" (p. 9). Second, despite postmodernism's usual disdain for polarities, the book advances a simple distinction between the role of "critic" and "scientist," as if a normatively engaged critical social science other than the discursive one proposed by Schram necessarily is an oxymoron. Third, Schram fails to examine reflexively the limits of his own preferred way of working or to explain how a focus on signification, buttressed, as in the substantive essays in the text, by an episodic engagement with data, effectively can advance either the goals of systematic understanding or social change.

By contrast, Handler's refreshingly direct intervention in debates about AFDC possesses the merit of clearly harnessing argumentation to purpose. Unlike Norris and Thompson, Handler understands that ideology, moralism, and politics cannot be wished away in the name of an abstract and agentless rationality. Unlike Schram, he does not weigh down his intervention with the baggage of a semisystematic postmodernism. Recent welfare reform proposals, he argues, blame and bruise the poor. However pitiful AFDC has been, its demise is even more deleterious. The arguments favoring abolition do not hold up; worse, they are partial and pernicious.

As an urgent policy brief shifting debate from the behavioral flaws of the poor to the labor-market causes of their poverty, this is more than a creditable performance. Its virtues, however, go hand in hand with defects it shares with other work of this kind, irrespec-

tive of ideological proclivity; for Handler puts on display a genre regularly found in policy writing of all persuasions, the policy prospectus that marshals only the evidence it likes. Handler is right to underscore how much public and elite misinformation there is to correct. Welfare mothers are not all African-American or very young; most do not linger as recipients; public provision has been meager; insecure job markets are an important part of the story. Yet, the divide he elaborates entirely separating poverty from personal mores is not convincing. He downplays the fraction of long-term recipients of AFDC or the disproportion of African-Americans who have stayed on the rolls more than seven years. Full of such elisions, the text unnecessarily relinquishes some of its credibility.

Welcome nonetheless as an antidote to conventional wisdom, Handler's advocacy is unsatisfactory as policy analysis. History, ranging from England's Statute of Laborers of 1349 to President Clinton's welfare proposals, is gleaned to attest that, inside the triad of capitalism, wage labor, and poverty, welfare policy has focused for more than five centuries on individual rather than systemic flaws. The past is reduced by this generality. Handler's history contains no variation or institutional particularity. It lacks a repertoire of choice. Analytically, it seems to contradict the purpose of the book itself. Why rail against the inevitable? The book's causal story—a simple functionalism in which symbolic needs are deployed as cause—likewise is unyielding, because it fails to specify mechanisms, analyze politics, or indicate points of likely intervention.

Thus, for all their differences, the flat rationalism of Norris and Thompson, the heretical postmodernism of Schram, and the semisystematic policy promotion of Handler share common features: a hortatory tone; a reductionist, instrumental application of history; and a lack of attention to the methods and contributions of social science. If critical policy analysis were to depend on the moves these scholars make, then it would be a nonstarter, since they demand decisions between symbolism and substance, politics and policy, and criticism and science which, if made, would leave inquiry misshapen and practical purpose unsecured.

HISTORY AND INSTITUTIONS AS REMEDY

Motivated by a policy literature on poverty, gone "stale" (p. 18), Michael Katz, a historian who has written a large body of first-rate work on cities, schooling, poverty, and race, much of it influenced by the social sciences, tries out a type of writing rarely validated by the academy: a combination of intellectual self-reflection tethered to autobiography, historical argument, and the analysis of policy. The result is an elegant and engaging, yet elusive, book. Providing a rich text for those of us interested in the sociology of knowledge, Katz probes how his own experiences and motivations have galvanized and shaped his fertile scholarship and directs attention to shifts in standards, language, and expectation that occur when scholars try to influence policy.

Deliberately abjuring prescription, he resonantly explores links between education and social policy, the conceptual faces of the term *underclass*, the ways central city inequality intensifies more widespread trends, the role of ideas in policy development, the contested distinction at the heart of liberal theory between public and private spheres, and the means by which historical time and forms of narrative are deployed in policy debates. This plenteous brew, like Schram's, is incisively critical of most policy studies of poverty. Katz, however, is far more judicious and fair minded; as in his appreciation of Wilson's work on the social and economic isolation of the ghetto, he is rather more interested in engaging the best policy analyses we possess than in dismissing them as necessarily implicated in the status quo.

Not surprisingly, Katz takes history very seriously. He helps us see how regardful attention to the past and the elongation of the time span of policy research can puncture myths and enrich contemporary analysis. History appears in *Improving Poor People* to make evident similarities and variations in distinct policy spheres over time and to observe that some policy prescriptions thought to be new in fact are not. Paradoxically, it is here, with Katz playing to his strength as a policy historian, that the book becomes most intellectually reserved. Its powerful challenge to dominant ideas focusing on improving the poor rather than on their circumstances (without losing sight of the poor as complicit in shaping their own lives) and to the deficiencies of historyless policy studies disappointingly stops short of generating a historical imagination constitutive of policy analysis.

Katz abjures the chance to make history causal by declining to explore how sequencing and path dependency might be taken seriously as operative ideas. The text's narratives are chock full of chances to do just this, but they are missed. He also draws back from comparing situations in which continuity has proved the rule (as in elite and mass representations of the poor as unworthy), as distinct from those marked by significant change (the discursive racialization of welfare is a rather recent phenomenon). Likewise, he shrinks from deploying the conceptual tools elaborated by political scientists to deal with the role of ideas in politics and policy, a theme central to his book (Goldstein 1993, Jacobsen 1997, Sikkink 1991, Weir 1992). Furthermore, the text, especially its brilliant analysis of decentralized school reform in Chicago, forgoes the opportunity to heed systematically how institutions shape human cognition and dispositions to form solidary groups and cooperate by conferring identities, polarizing, excluding, and assigning properties to categories (Douglas 1986, Wildavsky 1987). In short, Katz's excellent policy histories are incompletely historical and insufficiently institutional.

These are infractions certainly not committed by Kenneth Finegold or Theda Skocpol. By showing and telling, they strongly advance the case for a historical-institutionalist approach to social policy and the welfare state and, more broadly, to American political

development. *Social Policy in the United States*² compiles Skocpol's essays written from the late 1980s through the early 1990s at the moment she was bringing her landmark *Protecting Soldiers and Mothers* (1992) to publication. Though hardly alone in advancing historical-institutionalism, Skocpol has convoked this school's most impressive program of policy research for nearly two decades; her substantive achievements and programmatic counsel thus can be read as archetypal.

Although Skocpol asserts that this course of research can account for present-day social policy and help set agendas for future initiatives, the core of her essays lies less in the present than in characterizing past outcomes, including key traits of the New Deal, social policy during World War II, and postwar employment policy. Uneasy with the work of "moralists" and "technocrats" who lack historical and political sensibilities, she quests to discover "reliable insights into the political constraints and possibilities for making and remaking American public policies at any given historical juncture, including the present," by focusing on the interplay among institutions, conflicts, and alliances over time to investigate the "limits and possibilities in the *politics* of U.S. social policy making by taking a long historical view" (pp. 5–6). A secondary purpose secured via a comparison of policy episodes is the production of a shaded account of American distinctiveness, persuasively forswearing all-or-nothing notions of exceptionalism based on value continuities, that can account for variations under such comparable conditions as mobilization for total war. A key feature of her analysis is its focus on the significant influence of history and on how prior policy outcomes and their cognate institutional arrangements constrain the present and the future (p. 7).

These resonant strengths can be found in many of *Social Policy's* essays, including an excellent paper written with Gretchen Ritter, "Gender and the Origins of Modern Social Policies in Britain and the United States," and my favorite in the volume, an essay coauthored with John Ikenberry on social provision during World War II. Ikenberry and Skocpol want to know why outcomes concerned with planning and employment policy differed in these two cases; that is, why war and mobilization strengthened the social democratic impulse in the British case but limited it in the American. They proceed within an explanatory frame they summarize this way:

Wars are not fought by "the state" in the abstract, but by particular states with different institutional structures, prior policies, and contending political coalitions. Preexisting institutional structures and political coalitions influence the choices national leaders make about how to plan for the postwar period and how to mobilize the nation for war. The exigencies of war and the mode of mobilization reinforce some political forces and undermine others, in part by changing the agenda of problems discussed by the

nation's politicians and in part by changing the goals and capacities of politically active groups (p. 190).

Likewise, Finegold and Skocpol's long-awaited comparative historical study of the short-lived and in many respects unsuccessful National Recovery Administration (NRA) and the durable, instrumentally capable Agricultural Adjustment Administration (AAA) hunts within this orientation and displays its value-adding power. Elaborating on articles they first published in 1982, *State and Party in America's New Deal* uses a mainly structural-institutionalist research design focusing on bureaucracy and state capacity linked to a coalitional analysis of the Democratic Party to parse the New Deal. (Finegold 1982, Skocpol and Finegold 1982). Finegold and Skocpol show that Roosevelt's policies varied with respect to institutional design, governmental capability, and terms of linkage with civil society. They argue that his policy proposals, though advanced under common conditions, did not share conjoint fates. These varied not because of their intrinsic merit but as results of the lineage and arrangement of the circumstances in which they were propounded.

Set alongside the usual sorts of social policy studies or even the best work on policy by historians, the gains they make are pretty clear. History and institutions, treated configurationally rather than abstractly, are rendered integral and causal. The analytical space between thick historical chronicles and timeless models is filled to good and telling effect. Certainly, Finegold and Skocpol advance our understanding of the heterogeneity of the early New Deal and the character of America's welfare state far better than most students of public policy have been able to grapple with welfare reform.

LIMITS AND LESSONS

No one who reads Finegold and Skocpol's provocative and well-executed studies of New Deal industrial and agricultural policy or examines Skocpol's artfully honed disquisitions on social policy can fail to admire their craft, depth of research, or vivid originality. Why not stop with this warm appreciation and end with a call for more scholarship of this kind in political science and policy studies?

I have two main reservations. The first concerns the conflation in their work of an *approach* to the design of research with *tools* for a research design. Finegold and Skocpol counsel a reduction in levels of abstraction, preferring plural words (states, policies, institutions, coalitions) to singular concepts. They insist on the funneling role of past decisions and institutional products. They wager on times of upheaval. They venture the importance of parties and coalitions. I have no principled reason to oppose these judgments, but they raise as many questions as they answer. Finegold and Skocpol's advice would be more compelling if accompanied by an appreciation that the choices they sanction mask others about which they offer no counsel. Research at any level of abstraction, after all, requires what Jon Elster (1989) has denominated as nuts and

² This volume was published in Princeton Studies in American Politics: Historical, International, and Comparative Perspectives, a series I coedit with Theda Skocpol and Martin Shefter.

bolts for the social sciences, and these can take many forms. Concreteness, too, is not just a single good thing. After all, nominalist and notionally "abstract" issues like collective action problems entailed by non-voting are just as "concrete" as realist structures like multiparty or two-party systems.

If, moreover, empirical particularity is to be favored over conceptual generality (I, too, would make this choice if forced), then how, if at all, should more extensive concepts (or concepts linked in models of various kinds) be used to interrogate specific historical constellations? Surely, this is not an either/or matter, for absent such a linkage, case research hazards becoming an ad hoc art, risking makeshift redescription. If Finegold and Skocpol would rather err, as would I, on the side of historical specificity and the integrity of cases, then how should these instances be constructed to make them potentially deployable as units for comparative study (Katznelson 1997a, 1997b)? The scrutiny of past policies plausibly (I think manifestly) is important; but how might history be searched? By way of which mechanisms—branching models, learning theory, or other possibilities? If there is special merit to a focus on times distinguished by high uncertainty like the starkest parts of the Great Depression or the period of total mobilization during World War II, then what, if any, theory of historical periodization should underpin this selection? If the substance of individual and group identities and preferences necessarily varies by condition and occurrence, then how should their formation be studied to undergird both the macro- and microanalyses they recommend? How does the declaration that the past acts as a straightjacket on structures and actors square with the suspension of constraints often associated with times of emergency? Why is a focus on public administration, state capacity, and political parties inherently superior to studies of class mobilization, Congress, or Supreme Court decisions, to take other familiar (but here criticized) centers of attention? By overlooking such questions, Finegold and Skocpol undercut their intention to demonstrate historical institutionalism's capabilities.

Moreover, if historical institutionalism is to be more than a category in a scholarly typology but, rather, a systematic method for work in policy studies and political science, there simply is no good reason it should set aside research gear it might deploy to further its own purposes, provided the use of these tools is disciplined by rules of use historical institutionalists confidently establish. Instead, and this is my second reservation, Finegold and Skocpol take an entirely different tack. Rather than treat the existence of a theoretical and analytical tableau in the social sciences as an opportunity to sharpen and deepen the research capacities of historical institutionalism, they declare instead it is the superior *alternative*. Making social science a contest between clusters of schools rather than a form of knowledge possessing an ensemble of opportunities to guide analysis, they recurrently ask the reader to choose their superincumbent candidate, which, they aver, can cope with complexity on its

own, thank you very much, without any help from its putative friends.

Both *Social Policy in the United States* and *State and Party in America's New Deal* are organized in comparable ways to "test" the capacities of alternate ways of working. "State Formation and Social Policy in the United States," the essay Skocpol has chosen to open her volume of collected essays, explicitly contrasts her research program to "existing theories"—schools she labels logic of industrialism, national values, welfare capitalism, and political class struggle—each of which "offers insights but falls short of offering *fully* satisfactory explanations of . . . historical phases and policy patterns" (p. 15; emphasis added). In the book written with Finegold, the list of competitors to historical institutionalism shifts from these mainly substantive categories to the theoretical ones of pluralism, elitism, Marxism, and rational choice. Both books, especially the latter, measure historical institutionalism against these options.

Finegold and Skocpol perform this task in the following manner. Their comparative study of the NRA and AAA identifies a double-sided dependent variable concerned with the origins and content of these programs. Both, of course, represented unprecedented delegations of power to the executive branch to plan, regulate, and coordinate large chunks of the economy previously organized by the price system. They differed, however, in key features of sponsorship and in their patterns of development. The authors ask (p. 23): "Why did the national government enact programs favored by organized industry and rejected by organized agriculture?" "Why did the industrial program fail" while stimulating class conflict, whereas "the agricultural program [succeeded] for commercial agriculture" while reinforcing "class domination in agriculture?"³ To account for these diverse results, Finegold and Skocpol place "states and political parties at the center of analysis. The main variables employed in our analysis of the state are autonomy and capacity. The main variables employed in our analysis of parties are alignments and strategies" (pp. 23–4). They then measure up this mode of inquiry against its competitors on the basis of "fit," thus adopting, without public reflection, standard positivist criteria for testing a theory. While conceding that both the "NRA and the AAA are consistent with the most general premises of pluralist, elitist, Marxist, and rational choice theories of politics," they set these "big, abstract, and complex" candidates aside as insufficient because each "is inconsistent with specific aspects of the origins, implementation, and consequences" of the two programs (p. 218); but in this respect as well, they are theoretically reserved, leaving to the reader to speculate how they might want to distinguish between the abstract formulations they do not like and the "nuts and bolts" tools which can be

³ Note that the criteria of success are not in the least normative; rather, without argument, they seem to be exclusively those of instrumental rationality. I have raised questions about this approach to stateness elsewhere (Katznelson and Pietrykowski 1991, Katznelson 1993).

found inside such scholarship but which are not consistent from one type to another. What they do argue, in contrast to literature they do not much like, is that their work enjoys the advantage of a close accord between its objects of analysis and the causal narratives they develop, based on an appreciation for discrete institutional textures.

Given the interpenetration of their explanandum and explanans, however, this trial only could have produced the result it confirms, especially given the way Finegold and Skocpol characterize their opponents, often coming close to caricature. Consider elitism and pluralism. They announce that these depictions of social pressure and mechanisms of representation regard the social basis of politics as fixed. Always? Necessarily? Neither really is a credible claim. Consider Marxism, which they dismiss as functionalist and social determinist. Certainly, they appreciate that this tradition has been diverse, even historical and institutional, in ways far more nuanced than they represent and quite compatible in some of its variants with their own enterprise. Or consider rational choice, the main target of their ire, which they hold up for critical examination only when it wears its most aseptic and disembedded, and least institutionalist, garb. But, surely, they know just how curious some rational choice scholars have become about the origins and constraints of institutions and how committed many are to careful specification of cases, actors, and preferences in order to designate how and why people, understood as interdependent actors, make choices *inside* particular historical and institutional settings.

The victory Finegold and Skocpol produce is Pyrrhic. By flattening other orientations and epistemologies, they fail to do justice to the power of their own way of working or show its endowments to best advantage. Expostulating this way, they demand too high a price for entry to historical institutionalism's house (implicitly insisting other theories be left behind as irremediably flawed), and they unduly limit the scope of inquiry. Their "victory" contracts the number of causal variables we might examine, including the social structural ones both elite theory and Marxism embrace. It privileges some features of liberal representation associated with the party system as opposed to others (congressional processes favored by many rational choice analysts or interest-group activity singled out by the pluralists) without clarifying whether this is a theoretically motivated selection (if so, why?) or is limited to the two time-bound cases on offer. If the latter, then the avowal that historical institutionalism wins by a knockout is vastly inflated; but the former never is addressed. It also leaves the issue of microfoundations so important to rational choice entirely too open. To be sure, coalitions inside political parties regularly make an appearance in these texts, but in an untheorized way. Of course, there is more than one way to think about issues of agency; which do they like better, and why?

I prefer both more modesty and greater assertiveness. More modesty because the power of a given theory, we do well to remember, varies not just from case to case or from one object of analysis to another,

but can vary even inside the moments of cases under investigation. Challenging substantive puzzles always are complex; no one set of "nuts and bolts" ever can claim exclusive purchase on them. Indeed, neither of the key words in historical institutionalism's lexicon—*history* or *institution*—implies a single (unitary or compound) theory or subject matter. "Institution" gains its power as a concept to probe the infinitely intricate history of humankind by virtue of its junctional location at the intersection of structure and agency and of past and present. If it is one of historical institutionalism's goals to embrace complexity, then why, a priori, should it deny itself access to creative confrontations and substantive syntheses or work without a full kitbag of tools, including the fine-grained, systematic, and dynamic understanding rational choice offers with respect to the endogenous generation of institutions?

But I also prefer greater assertiveness. Historical institutionalism is right to claim a privileged, though not exclusive, ability to bind structure and agency to contingency.⁴ There is nothing wrong with wagering strongly on a particular approach, provided it remains open and self-reflective. Resolute and insistent, historical institutionalism should engage other theoretical and analytic approaches on *its* terms, assuredly making selections disciplined by its own purposes as it searches for criteria of appraisal which stand in the challenging location between the too-constraining jacket of strict positivist theory testing and the too-permissive art form of postmodernism (Laudan 1996). With respect to microfoundations, for example, it should advance situated understandings of rationality, an approach that does not so much compete with as incorporate the best features not only of rational choice (especially its focus on strategic settings and mutually dependent interaction) but also of bounded rationality (especially its realist sense of constraints on individuals not only because of their cognitive limits as decision makers but also as a consequence of restrictions imposed by structural situations), while insisting on the conditions of this encounter. Such a course would emphasize that rationality only can be inferred over time; that particular versions make sense only in specific normative and institutional settings which are culturally and structurally thick, not just strategically lean; and that it must link the internal and external environments of persons. A historically institutionalist approach to rationality would be agnostic about whether there really are choices in all "choice" situations and would locate behavior within the rules and practices that constitute regimes. It would have to make room for culture and incorporate identities ordinarily seen as nonrational. And it would refuse simple oppositions between rational and norm-guided action.

Following such a course, historical institutionalism might well teach students of policy and political science to dance more gracefully, beginning, perhaps, by re-tracing forgotten steps in the genealogy of policy

⁴ I owe this formulation to my colleague Charles Cameron's presentation at a Columbia University workshop on American Political Development, which we share in directing.

studies. I particularly have in mind the epigrammatic advocacy Harold Lasswell deployed more than four decades ago when he helped convene a who's who of American social science, including Kenneth Arrow, Edward Shils, Paul Lazarsfeld, Robert Merton, and Clyde Kluckhohn, to review and codify gains by the policy sciences during and after World War II "in order to cope with the gigantic crises of our time" (Lerner and Lasswell 1951, 7).

Lasswell's agenda-setting essay, "The Policy Orientation," opened the collection of papers these scholars produced. Substantively, he promoted a problem-centered focus. Normatively, he endeavored to advance the prospects of liberal democracy. Analytically, he sought to join two levels of analysis: methods focusing on choice, especially decision theory drawn both from microeconomics and cognitive psychology, deployed *in tandem* with an appreciation of and deep concern for "the awareness of time" and context ("the key terms which are used in the policy sciences refer to meanings, and contexts of meaning are changeable") and for "the institutional pattern *from* which we are moving and the pattern *toward* which we are going," an interest he herded under the umbrella he called "developmental constructs." Policy sciences braiding these elements, Lasswell argued, could improve "the rationality of the policy process" and become "relevant to the policy problems of a given period." He defined these quandaries as issues on the scale of depression, war, and America's racial divide, problems more fundamental than mere "topical issues of the moment." (Lerner and Lasswell 1951, 3–15).

This attractive program has been accomplished only in part. A good many students of policy, including political scientists of diverse stripes, have been happy to use the variants of decision theory to work on specific problems, but they have tended to neglect Lasswell's anxious normativity or his particular version of historical institutionalism and the manner in which he sought to link these theoretical and macroscopic concerns to agency-centered microanalysis. The time is ripe, I believe, not only to secure Lasswell's prospectus for studies of policy but also to deploy the elements he advocated to advance a richer, more appealing political science. The new historical institutionalism must be central to these advances. Its contribution will dissipate, however, if it seeks a role that is too autonomous or adverse.

BOOK REVIEWS

Political Theory

Left and Right: The Significance of a Political Distinction. By Norberto Bobbio. Chicago: University of Chicago Press. 1997. 148p. \$34.95 cloth, \$14.95 paper.

Thomas W. Gold, *New School for Social Research*

This is an important book for the field of political science and of particular interest to those whose work lies in the area of political ideology, European party politics, or contemporary Italian politics. Written by one of Italy's greatest living political philosophers, this compact, clearly written monograph makes a major contribution to one of the most crucial debates facing contemporary European politics.

In the first part of the book, Bobbio argues against the prevailing assumptions that the terms Left and Right have lost meaning in the late twentieth century. Some of the reasons that are often used to negate the distinction between Left and Right are the inadequacy of the polar division of politics in increasingly complex societies and the development of movements during the last few decades which are hard to place on either the Left or Right. But the impetus to smooth over the distinction, Bobbio argues, comes mainly from the Left itself. Groups and movements which claimed to be left-wing when the "wind of history appeared to be blowing in their direction" are now questioning the meaning of the division. He contends that by negating the difference, the Left is trying to recuperate some of its lost power: "In a universe in which the two opposing parts are interdependent, in the sense that existence of one presupposes the existence of the other, the only way to invalidate the adversary is to invalidate oneself" (p. 14).

Using a "conceptual" method with selective historical references drawn mainly from the Italian case, Bobbio argues that the continuing necessity for the distinction rests in the dyadic structure of politics. While the terms Left and Right, which go back as far as the French Revolution, are purely accidental, the dichotomous structure of politics is not. Political conflict, like other aspects of human relations, naturally falls into a dichotomous logic, creating "seemingly unnatural coalitions and alliances, both in international relations and between parties within a single state" (p. 32). On the basis of this "axiological either/or" structure, everything within the political universe belongs to one of two parts, leaving no room for a third alternative. Within this context, the subjective designation of one side as "good" automatically assumes the existence of the another side as "bad."

Bobbio further attempts to define the substance of the Left and Right. Left and Right are not "intrinsic qualities of a political universe" but terms located within a particular "political space." The two sides of the political spectrum "are not words which designate immutable meanings, but can signify different things in different times and situations" (p. 56). The "criterion," however, which actually governs the distinction in Bobbio's view is the "attitude of real people in society to the idea of equality" (p. 60); in other words, the difference between a "horizontal or egalitarian perception of society and a vertical or inegalitarian perception of society" (p. 58). He maintains that the Left and leftist movements in history have been primarily concerned with the fight for greater equality in society, while the Right has traditionally been tolerant of inequality and divisions within the social order. Bobbio further deconstructs the terms Left and Right to a conflict between "fundamental choices," that is, between those who feel (on the Left) that inequality in society is socially created and hence able to be eradicated, and those

(on the Right) who feel that inequality is a manifestation of natural forces and therefore inevitable (p. 67). While the Right emphasizes that which makes people different and unequal, the Left searches for what unites people and does so by encouraging policies which reduce inequalities.

Although Bobbio convincingly points out the validity of the distinction between Left and Right, his equation of the two terms with equality and inequality, respectively, conflicts with a more complex reality. In the first place, he is quite generous to the Left by identifying it almost unconditionally with the notion of equality, particularly when you take into account the changes in the programs of European Left parties during the last couple of decades which have brought them closer not only to the Right but also to tolerating different forms of inequalities. This oversight may have something to do with the timing of Bobbio's book, which was published shortly before the formation of the first Left-led government in Italian postwar history and the eventual implementation of the most severe budget-cutting measures in Italian postwar history. Bobbio's conceptual view of politics has a tendency to overlook the more instrumental nature of political behavior. The Left's image and identity continue to change as it faces a shifting social base and will, unfortunately, tolerate inequality if it means more votes.

Furthermore, the Left, the main proponent of the welfare state, is itself responsible for the creation of new forms of inequalities today. In an era of mass migrations in Europe, for example, the dividing line between the haves and the have nots is located between those who are citizens and noncitizens, or between those who receive generous social benefits in education, state jobs, medical care, and so on, and those who do not. In other words, while the welfare state has helped create a more egalitarian society for its own citizens, it has simultaneously set the basis for new kinds of inequalities in relation to new immigrants.

In addition, Bobbio spends a great deal of time examining the egalitarian roots of the Left, but he does not provide the same attention to the Right and its different varieties (from the neoliberal Right to the more statist, Gaullist Right). The Right in this book remains an unexplored residual category. Bobbio further does not analyze the full effect of how current relevant issues like federalism have been adopted by both the Left (in an attempt to bring power closer to the people) and the Right (as a means to reduce the national state's capacity to create a more egalitarian society).

In sum, Bobbio's analysis of the Left has normative implications which detract from his attempt to provide a value-free approach to the distinction between the Left and Right. In spite of this flaw, Bobbio successfully returns the heuristic value of the distinction between Left and Right to the study of politics. As he notes, the terms are still used widely today in journalism, academia, and public discourse and continue to provide the basis of political tendencies and trajectories. His book aptly demonstrates that even though global events—such as the fall of the Berlin Wall, the failure of the socialist republics in Eastern Europe, and the general "liberal" trend in Europe—have brought about a crisis within the Left, the distinction between Left and Right still is of critical importance.

Dancing in Chains: Narrative and Memory in Political Theory. By Joshua F. Dienstag. Stanford, CA: Stanford University Press, 1997. 268p. \$45.00 cloth, \$15.95 paper.

Jonathan N. Badger, *St. John's College*

One of the many paradoxes in Nietzsche is his insistence on the primary status of historical horizons for human self-

understanding coupled with his prescription for the deliberate construction of those horizons. How can we reliably or confidently destroy horizons and make new ones if we simultaneously depend on them. It is rather like fish trying to build an aquarium. A solution may lie in the form of some transcendent standard and guide—a standard beyond both old and new horizons—but this is exactly what Nietzsche cannot allow. Such a standard and perspective would undermine the view that all life occurs inside horizons.

This simple statement of the Nietzschean problematic is given a rich and beautiful expression in Joshua Foa Dienstag's *Dancing in Chains: Narrative and Memory in Political Theory*. Unfortunately, a solution to this paradox seems to elude Dienstag, just as it seems to elude Nietzsche. It does not really elude Nietzsche—he sees the solution perfectly well. Rather, he rejoices in the openness of the paradox. He deliberately banishes the solution. It is not clear that Dienstag wishes to settle for the paradox or that he sees that he is stuck in it.

Dancing in Chains develops a thesis which holds that most if not all texts of political theory are profoundly narrative in nature, containing plots, characters, and roles. While many texts masquerade as treatises of abstract reason, in fact they are often carefully crafted dramas. His case studies are Nietzsche's *On the Genealogy of Morals*, Hegel's *Philosophy of History* and *Aesthetics*, and (perhaps the most interesting and innovative example of this methodology) Locke's *Second Treatise of Government*. These "political narratives," Dienstag explains, are structured stories that contain revised histories which account for a dramatic present and point the way to a particular future. Political philosophy is about time.

This is not an old style historicism. Indeed, Hegel and Heidegger are hit rather hard in these pages. Their narratives reconcile the past and make the present utterly dependent upon it; but, says Dienstag, there is no future in their narratives. Hegel's "temple of memory" reverently holds the past up as the substance of the present. The story is about the present, which is the fruition of history. The present is the end. The narrative is closed. It cannot point to a future. "Like Narcissus, we lose our future in admiration of our present self-image" (p. 203). For Heidegger (who builds upon an Hegelian historicism), human beings are "thrown" into their lives. They have no control over their time. Their past is fixed, and thus their future is likewise given.

Not so for Locke and Nietzsche, whose narratives redeem the past, says Dienstag. Locke offers a revised history which points to a future of liberal self-rule. Locke found himself in a particular history but was free (enough) to change it. The Biblical account of history which supported monarchical rule was challenged by Locke's new history of labor, commerce, property, and contracts. Dienstag shows that Locke thereby points the way to a new and different future. Locke's "characters," which include his readers, live in an alternate narrative from the one given by the tradition of their time and place. Thus they have access to an alternate future. The story he tells is open, unfinished; the characters walk out of the text's present and into its future.

Similarly, and in a more powerful and profound manner, Dienstag suggests, Nietzsche transforms history and thereby the future. Nietzsche is more explicit in his use of time: His aim in the *Genealogy* is none other than an account for the development of memory and the historical consciousness itself, the creation of the very nature of human life. Man is the beast which remembers. Creating memory (rewriting history) is a crucial element of shaping the future.

"Memory," "history," "time," and "narrative" come to mean much the same thing in Dienstag's vernacular. They

become the elements, for him, of philosophy itself, replacing the conventional language of reason and ideas as the motion and substance of philosophy. He is careful to point out that he does not intend to replace philosophy as rational account with philosophy as narrative, only to offer it as an alternative to be considered. This seems reasonable, and his book is surely fruitful and wonderfully explicative of the texts under consideration. He demonstrates that his method is a useful tool in textual exegesis. Understanding the narrative nature of a text is indeed a necessary component of an authentic encounter with the text, and here Dienstag persuades. Thus, his book discloses something very important about the texts under examination. (The illumination of the narrative of Locke's work is particularly helpful.) But he seems to err in setting narrative alongside "reason" as the competing activity of philosophy. He does not seem to allow that narrative is a means which operates at the behest of reason, or of whatever is at the core of philosophy. Narrative cannot be the core.

Dienstag obeys this principle even as he denies it. His explication of Locke (his disclosure of narrative as the form), for example, must have its source beyond Locke's narrative but nevertheless within Locke's intent. In other words, Dienstag's understanding of Locke's narrative cannot be part of the narrative, but it may be part of—and consistent with—Locke's intent. Dienstag shows us Locke's aim (a new future) but is unwilling to distinguish this aim from Locke's narrative.

The desirability and formulation of the future to which a text points can be understandable only by means of rational account or, at the very least, by means of a mixture of reason and intuition. The narratives of great works are too complex to reduce to past-present-future formulations. Something beyond the narrative must guide us in our reading of the narrative. While our following the narrative is very important, it cannot rival our thinking about the narrative, which is inevitably beyond narrative.

Reason (or a part of reason), or some subrational impulse, is the source of the aim of the philosopher, and it is the thinking through of these aims that is the activity of political philosophy. Narrative at most is the means of presenting the aim. It is either a way of dramatizing the thoughts of the philosopher or a kind of subterfuge which seduces foot-soldiers into its scheme. We might also consider that the narrative is a way of making the aim accessible and desirable to the nonphilosopher.

What narrative is *not* is the source of the aim. If it were, then the philosopher would be a mere character in his narrative, not the author of it. To suggest that narrative is the activity of philosophy is to suggest that history produces the ideas which the philosopher believes to be her own. It is to contain the philosopher within the narrative which he believes he creates. Yet, if the philosopher does in fact create the narrative, then she does so for some reason, and this reason would necessarily be beyond the narrative to which it gives birth.

One can argue that history is in fact the author of ideas and that philosophers are not able to think independently of their time and place. But Dienstag goes out of his way to say this is not his view. He attempts to walk a difficult line: Ideas are not merely the product of history, but they may, finally, be expressible only in historical terms. On the one hand, if he is right, then philosophers (and students of philosophy) are caught in a very strange paradox—stranger than Dienstag admits. On the other hand, if there is serious thinking which is not bound by time and place, then we are obliged to look beyond the narrative, even as we attend to the narrative—the temporal motion—of a text of political theory. Dienstag does so, even if he resists admitting it.

Hypocrisy and Integrity: Machiavelli, Rousseau, and the Ethics of Politics. By Ruth W. Grant. Chicago: University of Chicago Press, 1997. 201p. \$22.50.

Ronald J. Terchek, *University of Maryland*

Ruth Grant has written an exciting and provocative work reassessing the role of hypocrisy and integrity in politics. Relying primarily on Rousseau but also reaching to Machiavelli and some of Molière's plays, she weaves together the complex and often competing goals of politics. For her, politics is not about discovering and then implementing a perfect system of justice, making a coherent community, or finding and then applying a standard of goodness. The hard realities of her version of politics are power, plurality, and dependency, realities that do not disappear when people gain their freedom.

Grant is neither a crude Machiavelli nor Mandeville when she writes about hypocrisy but a morally sensitive, humane writer who sees harm in pursuing an absolutist moral position in politics. To make her case, she contrasts integrity with authenticity. Authenticity often leads to a perfectionism that is intolerant of failure and accepts cruelty as a regrettable but necessary cost for honesty. Moreover, Grant finds that there is nothing intrinsically laudable about authenticity when the authentic person pursues goals that are self-regarding and damaging to others.

Integrity assumes that individuals have moral standards and act on them, and one of their standards has to do with how their conduct affects others. Sometimes this means that persons of integrity conceal their true feelings when honest expressions cause harm or embarrassment to others; at such times they display civility and manners. As Grant argues, there are times when it is preferable to offer others a polite compliment rather than express our authentic displeasure with them.

One reason Grant argues for a minimal hypocrisy is that it introduces flexibility into politics. Her argument is much richer than this summary view allows, however. She finds that politics is concerned with how a plurality of people live together, and this means, to Grant, how people depend on one another. Dependency can take many forms, as with the slave and master, but republican dependency is expected to occur among political equals. Republican citizens minimally depend on one another to vitalize and, if necessary, defend the free institutions of their republic, which assures them of their liberty. Such dependency, however, particularly when it involves sacrifice, may strike many citizens as counterintuitive. Grant's founding legislators as provided by Machiavelli and particularly Rousseau offer a myth that takes individuals away from their personal self-concerns and moves them into a shared community which teaches them that they have a stake in the well-being of their republic and that it can be maintained only through collective efforts. In a sense, the founding legislator provides citizens with materials to lead a principled life and act with integrity, and they do this through the founding myth.

As Grant sees matters, the founding myth is not meant to be transitional, eventually leading all citizens to authenticity. If all that people have is their authenticity and no standards, then interests become the subject matter of politics, which becomes the story of how winners are sorted out from losers. From a republican perspective, the ascendancy of interests introduces the politics of corruption. Corruption takes many forms, and today one of its manifestations comes with the decay of political language. For Machiavelli and Rousseau at least, political language should be about liberty and not about

economics or management. When the latter two dominate, interests become primary, and the autonomy of citizens becomes secondary.

Grant's work addresses the modern preoccupation with individualism, something she wants to tame but hardly eliminate. She knows that a politics composed only of interests is shallow, and she seeks to move politics to a better terrain. Why should she offer hypocrisy as an alternative? First, she is self-consciously concerned about power and how it can be used and abused. For most liberals and communitarians, politics must be authentic and serve justice, rights, or community; from this perspective, politics occupies a secondary, not central, role. Second, Grant works with the observation that founding myths are fragile, and even when they are most robust they do not cancel out the interests people have in their own well-being. Grant's Machiavelli and Rousseau know this, and she wants to remind us of how they use hypocrisy politically to dampen the place of interests in politics.

There are, of course, some dangers in assigning hypocrisy a place in politics. It invites those with power to shave the truth and mislead for what they take to be a noble cause, which the public might not accept if they had the unvarnished truth. One thinks of many, in and out of the military, who supported the war in Viet Nam and who relied on hypocrisy to win popular support for the project.

Grant offers hypocrisy and integrity as alternatives to contemporary liberalism, which she finds is defective in important respects. Grant, who is one of the most perceptive readers of liberalism, sometimes uses the term loosely in this work. Two kinds of liberalism surface here. She sees the liberalism of the Enlightenment seeking to unmask everything that it considers to be dishonest and the liberalism of self-interests making politics rest on self-regard and depend on bargaining. Grant knows there is another liberalism, the moral liberalism of John Locke, which she discusses in her sensitive account in *John Locke's Liberalism* (1987), but it does not appear here. Moreover, she is too quick to link all liberals to political interests, something she finds with Adam Smith. What is ignored here is that Smith justifies a negative state because he does not believe it is possible for the Invisible Hand to sort out interests to produce a political equivalent of a just price he sees emerging in economic markets. Smith wants to keep politics free of interests.

Grant's work is to be highly recommended, offering a fresh reading of Rousseau and Machiavelli as well as presenting a penetrating analysis of hypocrisy and integrity. What is also appealing about this book are its views of politics as both aspirational and pragmatic. To credit it only with the former is to invite a perfectionism which is inattentive to the cruelty it often unwittingly spawns. To consider only the latter is to make politics exclusively the story of power. In inviting us to look at the indeterminacies of politics, Grant offers a way out from the perfectionism of many communitarians and modern liberals and the pragmatism of many pluralists. Grant's politics is never fixed; it depends on idealism but requires prudence; it accepts that hands sometimes become dirty when integrity is at stake; and it is concerned with many goods, not just one. In carrying out her project, Grant writes about the ironic place of hypocrisy and integrity in politics, and she contributes to a literature that seeks to speak to a politics fit for a free people who want to keep their freedom.

Endgames: Questions in Late Modern Political Thought. By John Gray. Cambridge: Blackwell Publishers (Polity Press), 1997. 212p. \$54.95 cloth, \$22.95 paper.

Harlan Wilson, *Oberlin College*

Much of John Gray's published work engages political theory with real political life. *Endgames* is no exception. This extremely varied collection of essays addresses such topics and themes as critique of New Right politics; prophecy of the end of Enlightenment; exposition of green theory; commentary on contemporary theorists; and analysis of the direction of British party politics. The occasional papers in this volume, most of them previously published, consist of scholarly articles, book reviews, and even a series of commentaries on current affairs in the *Guardian*. If the compilation is uneven and not quite coherent as a whole, it is nonetheless of consistent interest. Most essays are polemical and aimed at a broad audience.

Gray shows a keen sense of endings and beginnings—perhaps too keen. Writing just before the sweeping victory of the Labour Party and Tony Blair, he pronounces a death sentence on the Tories. This may be thought surprising on the part of a man associated with the Right in Britain. But Gray is a conservative without nostalgia as well as a liberal without Enlightenment. For him, the problem is neoliberalism and the capture of the Conservative Party by Thatcherite neoliberal ideology. This he sees as equally disastrous for the Conservatives and for Britain itself. Politically, neoliberalism destroyed the culture of deference and solidarity which allowed the Conservatives to adapt and govern. Indeed, Gray thinks, the present Labour Party, like the New Liberals of a century ago, now better represents authentic conservative values than do the Tories. Intellectually, the triumph of neoliberalism with its rationalist economic doctrines is a bankrupt abstract ideology that does great damage to any society foolish enough to be seduced by it.

Gray has shown himself a good prognosticator of electoral fortunes. His analysis predicted very well, and for many of the right reasons, the Blair victory and the changed shape of electoral politics in Britain. His prediction about the "strange death" (p. 1) of the Conservative Party, however, could be a bit too eager. Perhaps the Conservatives of 1997 are more like Labour of 1979, capable of eventual adaptation and recovery, or perhaps like the Conservatives of 1951, who adjusted themselves to the welfare state, rather than like the doomed Liberals of 1918.

There is a larger point here for Gray, namely, that neoliberalism, indeed the Enlightenment itself, has no future. The most profound "endgame" is the death of Westernizing universalism, of which neoliberalism is perhaps a last desperate gasp. Yet, here, too, one may wonder whether Gray's prediction of the death of neoliberalism, especially in the form of global capitalism and market expansion, is a bit premature. Given the seeming inexorability of global economic rationality with its associated technological regimes, it would seem that the end of both neoliberalism and Enlightenment, however damaging, may need to be postponed.

Gray's critique of neoliberalism as a doctrine is trenchant and powerful. Like Michael Oakeshott, whom Gray admires, he finds fault with the fact that it is a doctrine. In terms of its content, Gray emphasizes how neoliberal policies of unrestrained markets destroy local community and political sovereignty without any political accountability. He agrees with Margaret Thatcher on one point: he believes Thatcherism brought about great social and cultural, not only political, changes. Neoliberalism prizes mobility without security; destroys both human communities and the environment for the

sake of an abstract Enlightenment doctrine of progress unrelated to human well-being; and hinders, rather than enhances, true individual autonomy. By failing to recognize limits to growth and progress, neoliberalism undermines the conditions that make stable and livable human communities possible.

This account is compelling but incomplete. Gray does not quite explain why neoliberalism was renewed in Britain or America or elsewhere, or how it could become politically effective in Britain at that historical juncture. He says that markets are parasitic on cultural traditions they cannot replenish but must destroy. Yet, somewhat akin to Edmund Burke in his *Reflections on the Revolution in France*, Gray does not explain why neoliberalism had such appeal to the middle class and even sections of the working class in Britain. As for American neoliberalism, Gray does not attempt to give a textured account, much less explanation. He caricatures American politics as if American political society were totally understandable by reading the Chicago school of economics, listening to Ronald Reagan, and watching "NYPD Blue." This is not a book to which one can go for subtle and nuanced foreign commentary on American politics.

Gray's treatment of market globalization is selective. It focuses on the ways in which global markets affect local culture, state sovereignty, and environmental risks, though without much consideration of how concentration of economic power, both within firms and in global systems, produce these outcomes. There is also little mention of the effects of global markets or of international free trade agreements on working-class security and empowerment. In any case, Gray grudgingly accepts the tendencies toward globalization. One may ask whether this means that global market expansion is not an endgame—whether, however damaging to culture and nature, it is the Enlightenment project with a future?

To his great credit Gray is one of a very few political theorists to address Green issues, as distinct from Green social movements or Green politics. He sees clearly that human relations with nature and the environment are not just parameters for politics, but themselves profoundly political. The connection he draws between traditional conservatism and elements of Green thought is original and persuasive. Drawing upon his previous critique of neoliberal antienvironmentalism in *Beyond the New Right* (1993), he demonstrates the connections between neoliberal hostility to human diversity and its utter disregard of environmental diversity and limits.

His treatment of Green theories, however, though sharply pointed, is not especially complex or nuanced. His characterizations of Left-Green thought and his attempts to refute socialist Green theory by reference to the failures of "actually existing socialism" in the Soviet Union are convincing only to believers. His depiction of mainstream Green theory as utopian is similarly overstated and perhaps shows a lack of familiarity with recent literature, much of it American, on environmental protection and democratic theory. Gray implicitly positions himself within Green theory as a neo-Malthusian, insisting on the need to recognize inherent limits and scarcities in nature and society alike. His neo-Malthusian argument for drastic population reduction omits the coercive measures that would be regrettably necessary to bring about this end.

Gray views the Enlightenment as wholly on the side of human exploitation of the natural environment. In particular, he problematizes the relation between Green theory and natural science. In this he departs from most neo-Malthusian

thinking and joins the company of ecofeminists, critical theorists, and postmodernists who express skepticism or even hostility toward natural science. (Somehow Darwinist perspectives, which he recommends, are not tarred with the scientific brush.) Gray seemingly is willing to go along with the project of undermining the authority of science in environmental matters, trusting that an ethical or even mystical notion of natural limits will somehow provide a basis for Green politics. Nevertheless, even though the sciences and technology are thoroughly implicated in the environmental crisis, it is hard to think that such issues as global climate change and acid rain can be fully understood or acted upon without reference to physical and biological discourse or evidence. Perhaps, too, for political as well as scientific reasons the undermining of the credibility of the natural sciences in environmental matters should not be undertaken lightly.

Finally, Gray's exploration of the late modern, post-Enlightenment world is strangely silent on issues of democracy and justice. One wishes that Gray had explored the meaning of democracy, that is, popular self-rule, in terms of the complex, multicultural world he projects. His disinterest in problems and dilemmas of democracy is especially notable in light of his sensitivity to the public costs of neoliberalism, which is incapable of conceiving of any meaningful kind of public life or democratic politics. Similarly, Gray writes as if class, differential power, and associated questions of social justice have no place in post-Tory British politics or in pluralist political cultures. Even granting the existence of essential "moral scarcity" (p. 42), does he think that aspirations for social justice will no longer matter in late modernity? Furthermore, neo-Malthusian environmental policies like population control would surely raise the most profound and serious questions of legitimacy and social justice.

Nevertheless, Gray's engaged approach to political theory in this volume at least allows us to think about such questions. This collection of papers succeeds in showing by example and illustration how theory can matter for ideology and practice, and how economy and polity matter for culture. If the analysis is often sweeping and incomplete, the book is nevertheless unfailingly stimulating and eminently worth reading.

The Political and Legal Philosophy of James Wilson 1742–1798. By Mark David Hall. Columbia: University of Missouri Press, 1997. 228p. \$37.50.

George W. Carey, *Georgetown University*

Mark David Hall observes at the outset that "James Wilson is perhaps the most underrated founder" (p. 1). Many, if not most, familiar with Wilson's contributions to our founding and our political tradition would delete the "perhaps." As Hall notes in his opening chapter, Wilson signed both the Declaration of Independence and the Constitution, being one of only six men to enjoy this distinction. He intermittently represented Pennsylvania in the Congress under the Articles, always seeking ways to strengthen the feeble confederacy, and he provided the legal arguments for colonial self-government, anticipating by several years the positions of Adams and Jefferson and furnishing the theoretical framework for what was later to become the British Commonwealth. He was the first to articulate the general outlines and principles of the Philadelphia Constitution—later developed more fully in *The Federalist*, on the occasion of his famous "State House Yard Speech" (October 1788)—anticipating the major arguments that would arise in the ratification

debates. He led the Federalist forces in the Pennsylvania ratifying convention, providing commentary on the nature of the Constitution that is still pertinent. He was long a highly prominent lawyer/politician in Pennsylvania, assuming the principal role in drafting the Pennsylvania Constitution of 1790; and, *inter alia*, he served as an associate justice on the first Supreme Court until his death in 1798, setting forth a conception of our federal union that predominates today.

The case for placing him in the front ranks of our founding fathers rests to a large degree, however, on other grounds. His education in Scotland, prior to his emigration to the colonies in 1765, came at the height of its "Enlightenment." At what point Wilson's formal education ended is still far from clear, but we do know that he was very familiar with the writings of leading Scottish Enlightenment thinkers, particularly Thomas Reid and Francis Hutcheson. We know, moreover, from his law lectures at the College of Philadelphia in the early 1790s that these readings and studies provided the basis for his development of a comprehensive and coherent theory concerning the nature of society and its origins, the sources of law and morality, as well as the meaning and importance of constitutionalism. Thus, Wilson more than any other founder possessed a systematic and relatively comprehensive moral and political philosophy that, in many instances, determined his stance on specific issues in the political arena. His unique status in this regard acquires special significance because he was so highly influential at the Philadelphia Convention—arguably more so than Madison—in shaping the form and substance of the Constitution.

Hall acknowledges that others have dealt with one or another aspect of Wilson's political thought and contributions. His avowed purpose, however, is a grander one, that is, to provide the first "comprehensive and systematic analysis of Wilson's political philosophy," while endeavoring to show how his "political theory influenced his concrete contributions to the creation of the American republic" (p. 1). The key chapters in this undertaking are those dealing with Wilson's understanding of the natural law, his moral epistemology, and his belief in popular sovereignty and majority rule, which rendered him "one of the foremost democrats of the founding era" (p. 90). As Hall ably demonstrates, these elements of Wilson's thought are interrelated. His belief in popular sovereignty, for instance, derives from his conviction that God is the author of "natural laws" that "may be known through different means, either moral sense, reason, or the Scriptures" (p. 42). He believed as well that individuals are endowed by God with a "moral sense" that enables them to apprehend the natural law and the "first principles of morality" (p. 74). Thus, as Hall points out, Wilson had faith in "majorities" to enact "laws in agreement with the natural law" (p. 90). And, consonant with his belief in majority rule, he also held "that the fundamental, underlying principle of government is the consent of the people" (p. 100).

Hall observes that controversy has arisen among scholars over whether Wilson is a "classical republican" or "Lockean liberal," the two major schools of thought that presumably informed American political thought during the founding era. Hall, however, does not believe Wilson "fits neatly into one category or the other" (p. 192). He differed from most classical republicans in opposing a "mixed regime" and in advocating a strong national government over an extensive territory. What is more, he looked with favor on the development of a commercial republic, an anathema to the classical republicans. At the same time, Hall notes, while Wilson shared many of Locke's views, particularly those relating to the state of nature and the social contract, "his natural law theory owed more to Scholasticism and Re-

formed Protestantism than it did to Locke," and his "moral epistemology" derived from "Scottish moral sense theory, not Locke's empirical epistemology" (p. 191). In sum, Hall finds that while Wilson "borrowed ideas from both the classical republicans and Locke," he "also relied heavily on the Christian natural law tradition, Reformed Protestantism, the Scottish Enlightenment, and continental jurists" (p. 192). This, of course, is further and substantial evidence that the classical republican/Lockean liberal paradigm is far too narrow for understanding the theoretical foundations of the Constitution.

Likewise, Hall believes that many close students of Wilson, perhaps bowing to the trend of twentieth-century scholarship that treats "the founders' religious claims as mere rhetorical flourish" (p. 36), have chosen to ignore Wilson's "clear attempt to found his moral and legal theory upon a traditional Christian conception of natural law" (p. 37). For this reason, Hall contends, these students also neglect critical aspects of Wilson's thought that derive from his religious orientation, among the more important of these being the limitations that natural law places upon the legitimate scope of government. Indeed, one of the most significant themes in Hall's analysis is that a complete understanding and appreciation of Wilson's teachings come only with a recognition of their Christian natural law foundations.

While, as Hall acknowledges, Wilson's thought stands in need of further analysis, particularly in light of our contemporary problems, his fine book will serve as a much needed starting point.

Our Elusive Constitution: Silences, Paradoxes, Priorities. By Daniel N. Hoffman. Albany: State University of New York Press, 1997. 297p. \$19.95.

Austin Sarat, *Amherst College*

One indicator of the continuing viability of the American Constitution as a force in our political and culture life is the ongoing preoccupation of scholars with figuring it out, getting it right, producing new ideas about how to divine its meaning. The viability of the Constitution is taken for granted in our political system, where its power is as much to be found in its taken-for-granted quality as in the majestic pronouncements made in its name. Why we do not just have a paper or symbolic constitution, or one that is not relegated to the margins of our political system, is infrequently examined and remarked upon. One of the real virtues of our elusive Constitution is that it reminds us that while its meanings may be elusive, it is a central force in our political life. In this book Hoffman presents a lively, if somewhat idiosyncratic, tour through the Constitution, covering some well-worn terrain but also touching on some issues, such as nationalism, that are rarely taken up in treatments of it. His argument is respectful of traditional approaches; though he claims to be interested in a constitutive approach to law. His analysis is almost unfailingly progressive in its tendencies, though it is frequently solidly conventional.

Hoffman's starting point is the perception that the Constitution is irrelevant to our political life. This perception, he notes, arises from a misunderstanding of the constitutional process. The Constitution works, he notes, in that it expresses meaningful principles, "understood and supported" by elites and mass publics. Much of this book is, in fact, an effort to understand and explore those principles. Crucial to those principles, Hoffman contends, is the distinction between law and politics; the conceptions of the people; the state, and its powers that animate the Constitution; and our conceptions of

personhood and rights. Each of these elements is taken up in its own section of the book, in which Hoffman engages with the major literature, articulating his own views through carefully reasoned criticisms of the views of others.

On the distinction between law and politics, Hoffman resists the extreme deference view, namely, that the courts should avoid any and all political questions. He argues that the status of judicial review in regard to such questions has to be judged in light of the extreme difficulty of amending the Constitution imposed by Article V. He endorses Bruce Ackerman's theory of "dualist democracy" as a way of articulating standards to judge the validity of various governmental and popular actions. Yet, Hoffman notes, any theory of the Constitution must accept that in regard to the law/politics distinction the Constitution's meanings will be at once "clear and unclear, settled and open to revision" (p. 45).

Some of the most interesting writing in the book is found when Hoffman tries to wrestle with the identity of the "People" from whom the Constitution derives its authority. Claims of presidential prerogative and demands for deference are sometimes made in the name of the People. Yet, Hoffman suggests that such claims must, in their extreme form, be resisted. In addition, some of our most crucial political issues involve questions of who is included in the "People." On these issues the Constitution itself is virtually silent, leaving them to the play of ordinary politics. In the end, Hoffman rejects both a pure "nationalist" view of the People and a "liberal" debunking of nationalism while calling for the further articulation of a liberal form of nationalism.

In the last section of the book Hoffman turns to consider ideas of personhood and rights. If there is to be a coherent theory of rights, he suggests, that theory must derive from an idea of what it means to be a person. He argues that there four major categories of rights ought to be ranked as fundamental: the right to life, the right of privacy, political rights, and socioeconomic rights. The last of these is, of course, the most controversial, suggesting as it does the priority of positive as opposed to simply negative rights. In his argument about persons and rights, Hoffman marks his distance from legal positivism, but he also somewhat surprisingly rejects natural law. This distance and this rejection are carried out through a review of various ideas of personhood deriving from philosophy, history, and science. From this review comes the argument that if we are to take rights seriously, then our ideas of personhood must be historically situated as well as attentive to the social prerequisites of personhood, including minimal subsistence needs, education, and "effective access to the economic and political processes that make for self-respect, social integration, and representation in the public sphere" (p. 231). Here Hoffman is at his most unconventional and his most radical. Here his writing is provocative even where it is not persuasive.

Those looking for a systematic, integrated treatment of either doctrinal or interpretive issues relating to the Constitution will not find it in *Our Elusive Constitution*. Instead, readers will find a cook's tour of major and substantial issues pertaining to the viability of the Constitution as a factor in shaping American politics. They will find Hoffman to be a serviceable guide, obviously well versed in the major debates about our Constitution. Throughout, this book is more pastiche than plan, more of a pointing to areas to which everyone must attend than a presentation of arguments and conclusions to which everyone will assent.

Greed, Chaos, and Governance: Using Public Choice to Improve Public Law. By Jerry L. Mashaw. New Haven, CT: Yale University Press, 1997. 231p. \$28.00.

Lee Epstein, *Washington University in St. Louis*

For well over a year now, political scientists have been engaged in a serious debate over the value of rational choice theory for the study of law and courts. On the one extreme are those who assert that it can be of enormous use in helping us to unravel the complexities of judicial decisions. On the other are scholars who suggest that it holds little promise in enabling us to develop plausible insights, explanations, and predictions.

This intelligent volume promises to play an important role in these debates. Mashaw views rational choice as neither a panacea nor a dismal failure. Rather, he "attempts" to "claim and hold elusive middle ground between public choice's champions and its detractors—to demonstrate in a series of public law settings both the insights that spring from taking public choice ideas seriously and the necessity for maintaining a critical distance from theoretical enthusiasms that sometimes lack internal coherence, not to mention empirical support" (p. viii).

If *Greed, Chaos, and Governance* did nothing more than "attempt" to stake this middle ground, it would make an important contribution. But Mashaw more than succeeds: He ably demonstrates—through the force of logic, coupled with a remarkable grasp of many literatures—why ardent supporters ought to temper their enthusiasm or at least redirect it and why hardcore detractors should reconsider some of the lessons choice theory has offered.

His chapter on judicial review ("Public Choice and Rationality Review") provides substantial evidence of my claim. As Mashaw rightfully notes, scholars and judges have spent decades, really centuries, trying to tell a "persuasive" story that would justify the judicial invalidation of actions taken by elected officials. Could public choice prove useful in helping to establish such an account? To this Mashaw replies, as he does to many other such questions throughout the volume, with a "yes but." The "yes" is as follows: Because public choice theory provides certain insights into how legislatures produce laws—mainly through greed (that is, as the result of private interest deals) or through chaos (that is, as artifacts of voting procedures)—it may help us to identify the circumstances that warrant active and serious monitoring. The "but" is equally straightforward: We should not necessarily equate lessons to learn with ideas to adopt or arguments to use. As Mashaw puts it, "perspectives from the public choice tool kit are useful in thinking about constitutional doctrine. But each must be labeled 'Handle with care'" (p. 52).

To drive home these points Mashaw delineates and critiques the positions of analysts advocating and opposing active judicial monitoring of legislatures. First there are the "true believers," those public choice theorists who argue that laws come about mainly through greed or chaos and, thus, see the need for aggressive judicial review. Mashaw clearly sympathizes with these views: He thinks that courts have taken the countermajoritarian "problem" too seriously, leading them to avoid judicial review in circumstances in which it may be warranted. But he also sees the flaws with this approach, primarily that the mere recognition that we live in a "highly compromised form of democracy" does not provide a good answer to the question about how courts should exercise judicial review. Next there are the "proceduralists,"

those scholars who agree that many laws are not well designed but believe that the remedy is procedural in nature: Legislatures should revamp their procedures to make better laws (that is, to become something of quasi-judicial bodies), with the job of judges mainly to police these procedures. While Mashaw acknowledges the value of this approach, namely, that it can be useful in helping to identify patently arbitrary abuses of power, he also points out a significant deficit: It ignores the lessons of greed accounts of the legislative process. Finally, there are the conventionalists, those who either take direct aim at the true believer view by arguing that it greatly exaggerates the problems of the legislative process or that it will lead judges to strike down virtually all legislation, thereby returning us to the days of *Lochner*. But this approach, as Mashaw points out, also ignores some of the central insights of the public choice literature; and, in some sense, it begs basic questions of how and how much courts should invoke judicial review.

In short, Mashaw's perspective is that the true believers overstate their case, while the proceduralists and conventionalists do not take the public choice story seriously enough. To put it another way, the public choice literature has "sounded an alarm" about the legislative process (albeit one that may be excessively loud), which other approaches have been hesitant to heed at least in part out of a fear that judges will respond with a *Lochneresque* zeal. But is this necessarily so? Can these visions be reconciled? Drawing on key insights of all three approaches (as well basic ideas embodied in the Constitution), while taking into account their deficiencies, Mashaw provides an answer: "public regardness," which turns on both substantive and process concerns. Or, as the author puts it:

I would have courts look for a combination of substantive and decision-process "danger signals" that together suggest that legislation is essentially private-regarding—that it benefits some group in ways that cannot convincingly be explained in terms of a broad range of possible public purposes, or in terms of a well-functioning democratic process. Methodologically, the argument is for viewing both the Constitution and constitutional cases whole; for taking seriously . . . the complicated as well as simple-minded ways in which legislation fails in its most basic function—to pursue the public welfare (p. 79).

How would this approach work? What will courts consider a "public purpose"? Mashaw leaves these and many other specific questions open, but to me the important lesson of this chapter and the others is a far more general one: A middle ground between the champions of public choice and its critics does exist, and Mashaw has managed to locate it by taking account of both the strengths and weaknesses of the theory.

In fact, my only concern with this volume is that political scientists who study law and courts will read it. Surely, it houses something for everyone: the advocates of public choice; the detractors; and even those who want to learn more about the theory, for Mashaw does a masterful job in explaining some of its key insights. At the same time, though, he does not invoke much in the way of quantitative evidence—a potential turnoff to members of this rather observationally oriented group.

But to ignore *Greed, Chaos, and Governance* on this ground would be to miss out on a great read. And on a volume that could not be more relevant to current debates within the field.

Machiavelli, Leonardo, and the Science of Power. By Roger D. Masters. Notre Dame and London: University of Notre Dame Press, 1996. 366p. \$32.95.

Albert Somit, *Southern Illinois University*

Roger Masters argues quite a few theses in this impressively erudite and wide-ranging book. Space being limited, I will focus on the four I regard as most important. First (chap. 1), and in my mind both regrettably and unnecessarily, Machiavelli's "new way" of looking at political behavior (as evidenced in *The Prince*) was significantly influenced by Leonardo da Vinci. Second (chap. 2), a close reading of *The Prince* reveals that, contrary to general opinion, it is philosophically consistent with the earlier *Discourses on Titus Livy*, and Machiavelli should be credited with having "laid the foundation" for the "constitutional" or "democratic" state (p. 5). Third (chaps. 3–6), Machiavelli's then-novel depiction of human nature and political behavior is still "valid in the light of contemporary natural science" (p. 5). Fourth (chap. 7), Machiavelli and Da Vinci made important contributions to the "emergence of modernity" and to the "specifically modern" way of looking at politics, art, science, and technology (p. 7). Let me address these ideas in the order stated.

The Da Vinci-Machiavelli Connection. As Masters notes, others have commented on certain similarities between da Vinci and Machiavelli; he, however, is the first to argue that the former significantly influenced the thinking of the latter. That argument rests on two contentions: (1) Da Vinci and Machiavelli were personal acquaintances, and (2) even if this was not the case, Machiavelli was familiar with Da Vinci's writings.

One fact is indisputable: Da Vinci was serving as Cesare Borgia's architect and military engineer in 1502, when Machiavelli was Florence's emissary to the Borgia court. But did they ever meet? There is no hard evidence of such a meeting. Furthermore, Masters acknowledges there is not "a single explicit reference to Machiavelli in the voluminous *Notebooks* of Leonardo"; conversely, "Machiavelli never discusses Leonardo in his writings—even though there would have been ample reason to do so" (p. 12).

Still, the absence of evidence does not constitute evidence of absence. Undaunted, Masters suggest that this very silence "may actually reinforce the substantive importance of the contacts between them" (p. 12). Finally, after distinguishing between a "maximal" (they were close friends) and a minimal (they may have met) interpretation of their relationship, he decides that "the truth must be somewhere between" (p. 13). I am puzzled both by this formulation (the minimal position should be that they *never* met) and by the logic of his conclusion.

Whatever the personal relationship of the two men, Masters insists, Machiavelli's thinking was "particularly shaped" by his acquaintance with Da Vinci's writings. That claim is based essentially on two items of evidence: (1) similarities in their ideas of military strategy and technology and (2) the description of a storm in Machiavelli's *Florentine Histories*, on the one hand, and, on the other, "striking drawings of such a storm as well as verbal descriptions of similar cataclysms" in Leonardo's *Notebooks* (p. 24). I do not find this "evidence" very persuasive, a problem to which I will later return.

The Discourses and The Prince: Which Is the Real Machiavelli? Most political philosophers have difficulty in reconciling the prorepublican Machiavelli of the *Discourses* with the Machiavelli of *The Prince*. Masters undertakes to square the circle by a "close reading" of the later work. Such a reading, he reminds us, calls for an awareness of "multiple levels of meanings," a sensitivity to inverted meanings, interpretations

based "on the assumption that the author was intentionally devious" (p. 39), and the perceptivity to draw meaningful inferences from what is *not* said. As Masters himself warns, "to be sure, great care is needed when reading in this manner" (p. 47).

The not altogether surprising fruit of such a reading is that, when so considered, the two works actually reflect the same underlying republican convictions. Has Masters successfully resolved a long-standing problem in political philosophy? I think not. Nonetheless, I can enthusiastically commend this particular chapter as an excellent example of what an able practitioner of what some would call a "Straussian" reading can accomplish in the way of textual exegesis.

Human Nature as Seen by Machiavelli and Contemporary Science. How does Machiavelli's understanding of human nature stand up in the light of contemporary scientific knowledge? Masters devotes almost 80 pages to this question, drawing knowledgeably on both the natural (ethology, primatology, behavioral ecology, sociobiology, evolutionary biology, neuroscience) and the social (game theory, public opinion and communication, economics, and at some length his own work in nonverbal communication) sciences. There is, he finds, "an extraordinary congruence" (p. 210) between Machiavelli's views and the findings of modern biological science and, implicitly, of social science as well. I would surely concur.

Machiavelli, Da Vinci, and Modernity. The attributes which collectively distinguish "modernity" from previous epochs are a concern with personal security, mobility, predictability, comfort, and progress. Did Machiavelli and Da Vinci contribute significantly to the "emergence of modernity"?

Certainly, Machiavelli did; in Masters's opinion, probably more so than anyone else: "When contrasted to Machiavelli, let alone the thought of antiquity, moderns from Hobbes and Locke to Hegel, Marx, and Nietzsche appear to base their understanding of human life on oversimplified concepts, erroneous assumptions, and biased interpretations of the facts" (pp. 162–3).

Masters also views Da Vinci as an important contributor to modernity, with his principal legacy being "the *scope* and the *interrelatedness* of the new ways of thinking he sought to introduce to virtually every human endeavor" (p. 170, emphasis in original). These "new ways of thinking" were to have a major effect on subsequent—and eventually modern—art, science, and technology.

Others, of course, have previously discussed the importance of Machiavelli and Da Vinci, respectively, for our present way of looking at the world. Masters does so, though, from a quite different perspective. And that brings me reluctantly back to what I regard as an unfortunate flaw in an impressive work of scholarship and imagination—his contention that Machiavelli was significantly influenced by Da Vinci, and his consequent decision to make that highly problematic contention his point of departure. There is no hard evidence for the purported influence, and the book does not require that thesis. Relatively little in the rest of the volume would have to change if Masters had instead opted to assess Machiavelli's and Da Vinci's respective contributions to posterity and modernity, rather than posit a close connection.

Masters's reading of *The Prince* may also evoke some skepticism, but his imaginative interpretation is manifestly a matter of opinion and, in any event, comes later in the book. But the dubious (at least to me) claim of a Da Vinci-Machiavelli linkage which opens the volume may, I fear, deter some readers from proceeding farther. If so, they will miss a first-rate, albeit often idiosyncratic, essay in Western intellectual history.

Democratic Temperament: The Legacy of William James. By Joshua Miller. Lawrence: University Press of Kansas, 1997. 172p. \$29.95.

Timothy V. Kaufman-Osborn, *Whitman College*

Joshua Miller's *Democratic Temperament* is a welcome addition to the revival of American pragmatism. For the most part, that resurgence has concentrated on the work of John Dewey and his suspect heir, Richard Rorty. Miller's concern, in contrast, is with the work of William James. Countering the caricature of James as a radical individualist for whom political concerns are irrelevant, Miller seeks to tease from his texts something akin to a coherent theory of participatory democracy. That theory, in turn, informs Miller's observations on various contemporary political dilemmas, including the sorry state of public education in the United States, the limits of tolerance in liberal political orders, the relationship between gender and democratic citizenship, and so forth.

As Miller is quick to admit, it is no easy trick to squeeze from James any sort of consistent political theory, let alone one that qualifies as democratic. In part, this is due to the fact that James never bothered to elaborate his political views in a systematic fashion. This problem is still more vexing because those texts that do take up political concerns are littered with what appear to be chronic ambiguities and/or outright contradictions. Most notably, James never really confronted the tension between his egalitarian celebration of everyday experience and his elitist pretensions, which are nicely captured in his characterization of ordinary folk as that "herd of nullities whose votes count for zero in the march of events" (p. 23).

"What method of interpretation is appropriate for a thinker with so many contradictions" (p. 8)? Miller deploys a variety of strategies in answering this question. Sometimes, for example, he seeks to reconcile apparent inconsistencies and so render James more or less coherent. He is persuasive, for instance, when he argues that James's brief on behalf of intellectual genius can plausibly be construed as an effort "to augment, not replace, democracy" (p. 106). At other times, Miller leaves James's contradictions unresolved but then, in an interesting move, goes on to show how they are indicative of some larger unresolved cultural or political incoherence. For example, noting the tension between liberalism's desire to constrain action within established constitutional channels and radical democracy's tendency to punch through those same boundaries, Miller argues that "James embodies the conflict between liberalism and democracy on the issue of political action" (p. 16). Finally, there are times when Miller simply concedes the impossibility of overcoming James's inveterate penchant for disorderly thinking: "Although James offered pluralism as a source of both action and respect, the psychological roots of the one are incompatible with the other. He understood that action usually springs from a passionate belief in a principle and that this passionate belief leads the typical political actor to resist pluralism" (pp. 81-2).

Leaving aside the question of whether the effort to render James consistent sometimes generates strained readings, and leaving aside the question of whether the attempt to render James systematic is somehow at odds with his affirmation of life's "buzzing and blooming confusion," Miller's struggle to "rescue James as a democrat" (p. 23) raises another and perhaps more significant issue. Miller's aim is to salvage not just any sort of democrat, but rather a democrat with clear participatory stripes. By participatory democracy, Miller means something quite familiar to those of us who are creatures of the late 1960s: a commitment to substantive

equality, a challenge to the bureaucratization of political life, a celebration of localism, a criticism of received authority relations within the classroom, and so on. These are worthy goals, and Miller does a very credible job of showing how James can shed light on what it means to seek their accomplishment within the confines of a profoundly antidemocratic order.

What, though, is lost by assimilating James to this commonplace, albeit critical, conception of democracy? What we lose, I would suggest, is an opportunity to consider James as a radical (as opposed to participatory) democrat, where the term "radical" signifies an effort to defamiliarize our conventional understandings of the very nature of the ideal we mean to pursue. Such an accomplishment might be possible if we, as Miller generally does not, were to pay less attention to James's express claims about politics and more to the political import of his philosophical, that is, his ostensibly nonpolitical, texts.

Miller takes a tentative step in this direction when he elicits from James's antifoundational epistemological commitments a generous conception of mutual respect, one that goes well beyond liberalism's pinched defense of toleration for those who are different. He does not, however, do much with James's ontological writings and, more particularly, with the essays contained in *A Pluralistic Universe* and *Essays in Radical Empiricism*. While I am reluctant to criticize Miller on the grounds that he failed to write the book I think he should have written, I do believe that the relational ontology James sketches in these texts opens up new and potentially radical ways of thinking about the promise of democracy.

For example, as I read them, the ontological pluralism espoused in these volumes invites us to call into question the dreary opposition between liberals and communitarians. It does so by suggesting, first, that difference is etched into the very structure of what James dubbed the "multiverse" and, second, that such difference is itself a fruit of the complex webs of affiliation from which it is teased. While an exploration of this quasi-Nietzschean insight will not overcome the contradictions in James's expressly political writings, it may help us think our way through some of the thornier dilemmas confronting democratic theory and democratic politics today. Think, for instance, about identity politics and its alleged threat to the possibilities of broadly based democratic action. If, as James's ontology intimates, the identities of those given to such politics are creatures of those to whom they define themselves in opposition, then does collective action really require the achievement of an unambiguous shared identity on the part of its participants? And does not this insight open up promising ways of thinking about the prospects for various forms of coalitional politics among those otherwise all too quick to demonize each other?

Because Miller is given to a communitarian vision of participatory democracy, he is indisposed to explore such possibilities. He comes closest to doing so in his brief discussion of William Connolly's argument on behalf of adversarial democracy based on an agonism of differences; on that account, which could be construed as a possible articulation of the political import of James's ontology, opponents respect the antagonists whose identities are acknowledged as essential to the constitution of their own. Such a possibility, Miller says, "seems impossible to realize" because "it is difficult to imagine political relationships forged by gratitude for alternative interpretations of oneself" (pp. 73-4). In this world, Miller's point is perhaps well taken. In a world that took James's pluralistic ontology more seriously, it may have appeared less so.

In his conclusion, Miller recapitulates his central aim as

follows: "I have not tried to claim that James was a political theorist rather than a philosopher. Instead, I have argued that political concerns were central to his intellectual work and that studying James while remaining aware of those concerns is useful for political theorists and anyone interested in the future of democracy" (p. 119). This Miller has done, and done very well. While I remain convinced that a more provocative, and perhaps more disruptive, conception of democracy lurks within pragmatism, Miller has performed a genuine service for those who would enlist James in the cause of participatory democracy.

The Last Word. By Thomas Nagel. New York: Oxford University Press, 1997. 147p. \$19.95.

Ruth Lessl Shively, *Texas A&M University*

In disputes about justification, some theorists would give the last word to the relativistic qualifier, making statements of truth valid only from the perspective of the person or group. Others would give the last word to an unqualified notion of reason, giving statements of truth a validity independent of any particular perspective. Thomas Nagel's *Last Word* makes a remarkably clear and forceful case for the latter rationalist position as against the former subjectivist position.

The argument rests on a kind of restatement of Descartes's *cogito*. There are built-in limits to subjectivist doubt because challenges to the independent validity of reason must themselves assume the independent validity of reason. Or any explanation of reason deriving from *outside* the mind—as produced by natural or nonrational forces—can itself be explained only from *inside* the mind, as having its own independent validity.

The argument is an old one, but Nagel explores and extends it in new and fruitful ways, applying its insights to the fields of language, logic, science, and ethics as well as demonstrating why each of these forms of knowledge must be grounded in immediate, first-order thought about the world. In the process, he not only refutes a number of common mistakes about reason—in particular, the mistake of thinking that we side-step the Cartesian problem by replacing objective judgments with other judgments about rules of practice, standards of rational acceptability, or forms of consensus—but also, in what was for me the most interesting part of the book, he speculates about possible reasons and possible cures for subjectivism's continuing appeal among modern intellectuals.

One such reason has to do with the fact that subjectivism is so appealingly simple. The idea that all counterclaims can be denied with a simple and endlessly generalizable response—"That's just what you think"—has a fundamentalistic attractiveness to it. While, in contrast, the defense of rationalism must always be a complex and piecemeal endeavor, a more demanding (though ultimately more rewarding) attempt to show that, within each field of knowledge, an objectivist account of the evidence is needed.

The appeal of subjectivism also arises out of a certain reductionist impulse in modern explanation, for insofar as modern thinkers make the explanation of things hinge on their reduction to local and finite terms, they ensure subjectivist (or locally and finitely defined) conclusions. And, as such, they ensure against rationalist explanations that refuse to make reason into something nonrational or that conceive of reason as a capacity for grasping the universal and (sometimes) infinite principle from within the local and finite perspective. As Nagel points out, however, the reductionist explanation is itself dependent on an irreducibly nonlocal,

objective understanding of reason; doubt about reason presupposes reason's independent validity. And as such, reason's independent validity cannot be coherently doubted.

Finally and most intriguingly, Nagel connects the appeal of subjectivism to a "fear of religion" that preys upon modern intellectuals, himself included. This fear works against rationalism, he says, because it is hard to envision a rationalist world—a world in which there is "a natural sympathy between the deepest truths of nature and the deepest layers of the human mind" (p. 130)—that is not religious. Or there seems less threat of a divine presence in a world that is driven by natural accidents, mindless mechanics, and other safely "dead" principles. But since the antirationalist option is, again on Cartesian grounds, self-refuting, Nagel suggests that there is no choice but to embrace a more "mind-friendly" cosmology, though he assures the nervous atheist that this can be done in a nonreligious way.

I have just two small quibbles with this book. One has to do with Nagel's description of his position as Cartesian or Platonic when it seems to me to clearly imply and require an Aristotelian (or similar) framework. (Curiously, Aristotle is featured on the book's cover but never mentioned within.) Some such framework is implied, I think, by Nagel's decidedly realist take on first principles, that is, by his important recognition that the attempt to prove these principles is fundamentally misguided and that if we are to think at all, we must simply accept the mind's adequacy to the world. "We begin from the idea that there is some way the world is," he writes, for example, "an idea to which there is no intelligible alternative and which cannot be subordinated to or derived from anything else" (p. 81). This and other insights are reminiscent of Etienne Gilson's brilliant, though neglected, argument against Cartesian idealism in *Thomist Realism and the Critique of Knowledge* (1939). As Gilson rightly observed, one either begins with the realist assumption of an intelligible world or with an idealist assumption of doubt about an intelligible world, in which case one can never come into contact with that world.

This is not to deny that Nagel's use of Descartes's *cogito* helps illuminate the logical problem of subjectivism or that Plato's idea of harmony provides a nice metaphor for the mind's correspondence to nature. It is simply that the idealist limitations of both philosophies keep them from providing the positive explanation of reason that the thesis requires: a realist explanation, that is, one which assumes the mind's capacity to grasp what is necessary or universal in the body's contingent and particular experience. For only then can the act of knowing unite the mind and the senses, or the universal and the particular, in a way that avoids both empty rationalism and irrational empiricism.

A second minor complaint concerns Nagel's dismissal of the theistic explanation for reason; he argues that the concept of God does not provide an explanation or is a mere "placeholder" for an explanation because it is itself inexplicable. The problem here is that Nagel has already refuted this kind of objection when lodged against his own position. He rightly argues that to object to reason on the grounds we cannot strictly explain it in naturalistic terms is to misunderstand the irreducible nature of the concept: the fact that it cannot be so explained without losing its meaning or validity and that, as such, it is justified in a different way, by showing it to be necessary to intelligible thought and action. On the same grounds, then, the concept of God would be justified, or would be something more than an empty placeholder, if it turned out to be irreducible and yet necessary to intelligible thought and action. One may argue against this conclusion, of

course, but the point is that this is the argument to be defeated.

These quibbles aside, Nagel's argument is impressive. And while it does not deal directly with political questions, it is a much-needed corrective to certain pervasive tendencies in political theory today. In particular, it provides a necessary challenge to the often uncritical privileging of subjectivism that pervades the discipline and calls attention to the many ways in which this tendency (or the subjectivist's easy dismissal of rival claims as merely rival opinions) undermines our ability to engage fruitfully in argument with others.

Foucault's Discipline: The Politics of Subjectivity. By John S. Ransom. Durham, NC: Duke University Press, 1997. 225p. \$49.95 cloth, \$16.95 paper.

Michael Mahon, *Boston University*

Michel Foucault called a 1978 Sorbonne lecture "What Is Critique?" because it would have been immodest of him to dare to entitle it "What Is Aufklärung?" John S. Ransom in his excellent new interpretation shrugs off considerations of modesty and boldly lays bare the relationship between critique and Enlightenment, significantly advancing our understanding of this seminal thinker's work. Foucault's version of Enlightenment, Ransom argues, requires the separation of critique from utopian visions, of liberation as goal from Revolution as event, of oppositional thinking from normative ethics, establishing critique as an end in itself rather than as a means to some other purpose. Ransom emphasizes three prongs in Foucault's notion of critique, recognizing Foucault's intellectual debts to Heidegger, Nietzsche, and Kant. From Heidegger, Foucauldian critique transforms our "ready-to-hand," unthinking, and unexamined mode of being into "present-to-hand" subject matter for critical evaluation. Nietzsche revealed the critical power of historical genealogy, enabling careful scrutiny of thoughtlessly accepted conventions. Kant contributes to Foucault's critique a rootedness in the world and the present and an almost entirely negative understanding of Enlightenment as an exit, a way out, an escape. Kant thereby frees the critic from any alleged obligation to anchor critique in a positive utopian alternative to the present.

That, according to Ransom, is precisely what Foucault's best-known critics demand of him. Ransom, not unfairly, tends to lump these critics together—Jürgen Habermas, Charles Taylor, Thomas McCarthy, Nancy Frazer—because, while each contributes her or his own nuances, their criticisms of Foucault share a distinctive family resemblance. Their common bottom line is expressed most concisely by Frazer ("Foucault on Modern Power," *Praxis International* 1 [October 1981]: 286; Ransom, p. 171): "What Foucault needs and needs desperately, are normative criteria for distinguishing acceptable from unacceptable forms of power." But in order for such norms to have the universality demanded by the critics, Ransom argues, they require grounding in a stable and universal human subjectivity that Foucault explicitly and repeatedly denies us. What effective liberation movements "desperately need," says Ransom, borrowing Frazer's language, is not to reveal universally applicable norms, nor to penetrate the eternal truth of our subjectivity to ground such norms, but to create new modes of being producing new norms.

Perhaps Ransom's most important contributions result from his willingness to take seriously what others only pay lip service to: the old news that Foucault's work is Nietzsche-inspired. A common misinterpretation of Nietzschean gene-

alogy (even among Foucault's sympathizers) is that it attempts to reveal that power was operating in the formation of, say, Christianity or the modern prison system, and that this presence of power at the origin calls forth its denunciation. But such a revelation is no revelation at all for Nietzsche and Foucault. The assertion that power operates at the origin of anything is, for them, true but trivial. The important question is the *how* of power. The realities that confront us have been made, and they can be unmade if we understand how they have been made. Foucault's claim—also true but trivial, but not often enough recognized as such—is that administrators and police chiefs, prison wardens and social workers, flunkies and bureaucrats, rarely engage in political philosophy, rarely concern themselves with normative criteria, questions of the human essence, or the design of utopian fantasies. But the products of their pens more often see the light of day. Genealogy, after all, as both Nietzsche and Foucault maintain, is gray, meticulous, and patiently documentary, not a matter of looking about in the blue. *Pudenda origo*.

Ransom more effectively delineates various uses of genealogy than any other Foucault interpreter. Much too briefly, conflating what Ransom so carefully distinguishes, we might call them negative and positive genealogical strategies. A historical genealogy of battle lines and contingency "prods us to become aware of unquestioned assumptions, thoughtless gestures, seemingly legitimate institutions, and unexamined modes of thought by revealing their contingent and (sometimes) violent foundations" (p. 95). A more positive, political genealogy narrates a troublesome history, often previously concealed, in order to advance the formation of a responsive community of action, retrieving previously disqualified or insufficiently elaborated "subjugated knowledges." This richer, nuanced understanding of genealogy illuminates anew the centrality of Foucault's commitment to freedom.

Ransom's interpretation of Nietzsche occasionally psychologizes Nietzschean genealogy. Foucault carefully separates Nietzschean genealogy from Paul Rée's English tendency to seek psychological origins, while Ransom portrays Nietzsche too much like Rée, tracing "psychological roots and effects" (p. 5). The index is annoyingly incomplete, at least for this reviewer's purposes. But to elaborate on such criticisms would be to nitpick and detract unfairly from the outstanding contribution of this well-written and well-researched, rigorously thoughtful work.

The Anglo-Marxists: A Study in Ideology and Culture. By Edwin A. Roberts. Lanham, MD: Rowman & Littlefield, 1996. 320p. \$67.50 cloth, \$24.95 paper.

Bradley J. Macdonald, *Colorado State University*

For students of British Marxism, Edwin Roberts's book will be a welcome historical study of generally overlooked Marxist theorists. Focusing primarily on the period between the 1930s and 1950s, Roberts deftly combines textual exegesis of the work of major Marxist figures (in particular, John Lewis, J. D. Bernal, J. B. S. Haldane, and Maurice Cornforth) with a clear rendering of the vicissitudes of the British communist political movement (in which all these theorists were important participants). In this respect, the reader is treated to a clarification of the intimate relationship that existed between the development of Marxist theory in Britain and the fortunes of the Communist Party of Great Britain (CPGB). As an historical study of this nature, the book is a needed addition to scholarship on British political history and British political theory.

The historical value of the study clearly surfaces in the middle five chapters. Roberts begins his narrative by looking at the roots and subsequent flourishing of Marxist theory in Britain during the pre-Communist Party days (roughly between 1883 and 1920). In this context, Roberts provides a concise yet subtle historical rendering of the growth of a rich Marxist tradition among differing elements within the British socialist movement: The first modern English socialists (which included such notables as H. M. Hyndman and William Morris) appropriated Marx's writings into their somewhat eccentric positions. Tied to the growth of working class education, "proletarian autodidacts" like T. A. Jackson and Tom Bell began to articulate Marxism as a "proletarian science" closely associated with their life experiences. During the early twentieth century, the development of the first avowedly Marxist parties (e.g., Socialist Labour Party, British Socialist Party, and Socialist Party of Great Britain) provided ample organizational space in which to disseminate Marxist theory. All in all, the pre-Communist Party era was a theoretically productive period, one in which Marxist ideas were being increasingly integrated within the discourses of the British Left. It was also a period in which Marxism began to enter into diverse arenas of English intellectual life.

Yet, according to Roberts it is not until the founding of the CPGB in 1920—when Marxism could finally become organizationally sound and theoretically codified—that we perceive the truly productive reverberations Marxist theory had on other intellectual fields. For members of the CPGB, Roberts notes, "the program for working-class liberation was a unified science of society being put into practice by the government of the USSR. The job for Marxist intellectuals in the Communist Party era would be to translate this new doctrine into a British context" (p. 55). Such theoretical "clarity" and cultural translation is brought out by Roberts in separate chapters that detail, respectively, the careers and writings of John Lewis, the "red scientists" (J. D. Bernal, J. B. S. Haldane), and Maurice Cornforth. Each of these thinkers applied Marxist theory in the British context by wedding it to indigenous intellectual traditions, be it Greenite idealism, British scientific discourses, or analytic philosophy. Perry Anderson's famous argument about the poverty of a Marxist tradition in Britain is laid to rest. Robert's study allows one to see a rich British tradition of Marxist thought that has been developing since the turn of the century, one that is interesting and important in its own right.

Aside from the historical value of these theorists for understanding a particular period in the British Marxist tradition, why should one look to them? What theoretical issues, if any, do they raise that show them to be important innovators in this tradition? Moreover, what does the analysis of this trajectory add to our understanding of the tradition of Western Marxism in general? It is to the credit of the author that these questions are not ignored and that he links his historical excavation of these theorists to larger methodological and conceptual issues that would be of interest to students of Western Marxism in general. Yet, it is precisely in attempting to answer these larger questions that the work's argumentative structure begins to strain, tending to leave the reader with pages of historical description and textual exegesis without any definite sense of the larger relevance and significance.

For the author, two overall goals drive his historical narrative. First, Roberts wishes to settle a *metatheoretical* issue of how we can understand hyphenated forms of Marxism in general. In this respect, the period between the 1930s and 1950s offers one a telling case study of the ways in which Marxism takes on unique hybrid forms. In Chapter 1, Roberts

attempts to lay out some methodological criteria for use in this matter: "We can define a hyphenated Marxism as a school of thought constructed by those seeking to resolve a question through the means of a Marxian method with the hope of achieving the verification of a Marxian principle while doing this within a framework of some non-Marxist theory that must be imported into Marxism in order to solve the problem" (p. 10). Leaving aside the issue of its conceptual cogency, such a definition begs the question of whether there are such distinct realms of theory within different schools of Marxism. Indeed, many of the practitioners of these schools of "hyphenated Marxism" assume their theory to be intimately Marxist. The problem with this definitional assumption clearly arises when Roberts points to well-known schools like existential Marxism and structural Marxism as good examples of this hybrid form. As students of Western Marxism are aware, both Sartre and Althusser would balk at the claim that their form of Marxism is embedded in a "non-Marxist" framework (e.g., Althusser saw his structuralist position as reflected in Marx's mature work itself).

After taunting the reader with such a definition, Roberts argues that there are forms of hyphenated Marxism that are culture specific (e.g., "Austro-Marxism"), and it is ultimately this type of Marxism that is more directly related to his area of study. Moreover, Roberts sees his work as definitively showing that there is a unique and specific tradition called "Anglo-Marxism" (see pp. xiii, 1, 15, 270). What allows us to define a particular tradition as "Anglo-Marxism" is that it is a form of Marxism which both draws upon traditions unique to British intellectual life and responds to unique political issues associated with that particular context. While Roberts is on firmer conceptual ground here, one wonders—particularly after consuming the historical details he lays out—if the term "Anglo-Marxism" really helps us that much: While the theorists he covers are all English, they all drew upon a form of Marxism that was manifestly Soviet inspired (particularly, as Roberts notes, Lenin's and Stalin's interpretations of Marx), and each drew upon different, seemingly antagonistic, indigenous traditions (e.g., Greenite idealism for Lewis; analytic philosophy for Cornforth). Unfortunately, after all is said and done, one is left more with doubts than assurances concerning the unique and specific character of "Anglo-Marxism."

Roberts's second goal is the interesting *genealogical* claim that this early Anglo-Marxist trajectory seems to be an important theoretical precursor to the recently influential school of analytical Marxism, a school most clearly represented in the works of G. A. Cohen, Norman Geras, and Alex Callinicos. While the author puts forward this position tentatively at first, he does argue that Cornforth's espousal of a form of "scientific empiricism," his attentiveness to the "logical structure of arguments," and his rejection of Hegelian metaphysics are paralleled in the concepts and methods of present-day analytical Marxists (pp. 6–9, 241–2). On the surface there are clear "family resemblances" between Cornforth's position and that of a G. A. Cohen. Moreover, they are both English. Yet, sharing both a nationality and a general goal of being conceptually and logically rigorous in one's theory does not necessarily establish a school of Marxist thought, let alone point to the necessary continuities associated with a unique Anglo-Marxist tradition.

While not ultimately successful at achieving these larger goals, Roberts has produced a work that elucidates a deep reservoir of Marxist thought in twentieth-century Britain. In so doing, he has offered the reader a picture of a more integrated and interconnected British Marxist culture than one may have assumed.

Nomos XXXVIII: Political Order. Edited by Ian Shapiro and Russell Hardin. New York: New York University Press, 1996. 532p. \$45.00.

Brian Barry, *London School of Economics*

My picture of the way in which books in the *Nomos* series come into existence is this. The editor starts off with a vision of a sleek, unified volume in which all the contributions will relate in predetermined ways to the announced theme. Three papers are then commissioned for the annual meeting of the American Society for Political and Legal Philosophy, and their authors (as is the way with authors) proceed to write about whatever they had in mind to write about, while the discussants (two per paper) ride off on hobby-horses of their own. To get back to the original plan, the editor then casts around for additional authors, who may or may not provide what was hoped for. The result of all this is the plump volume that members of the ASPLP look forward to receiving just when memories of the meeting are beginning to fade (in this case it took place in 1993).

The Introduction to *Political Order* (pp. 1–15) suggests that this time the editors just gave up. In the past, the introductory essay has on occasion been a substantial free-standing review of the topic. Here, general introductory remarks cover only one page of text and identify ten “questions about political order” (p. 1). This may seem like a lot of questions for eighteen chapters, but the editors prudently hedge their bets further by saying: “Our authors address these *and related questions* in all their richness and complexity” (p. 2, emphasis added). The rest of the Introduction simply summarizes the chapters, enhancing rather than assuaging the impression one gets from reading them of (to borrow an expression quoted on p. 116 from Walter Dean Burnham) “one damned thing after another.”

If we forget about coherence, however, and take a hint from most of the authors in not worrying too much about political order, then we can get quite a lot out of the book. Two chapters would make very useful student assignments: Norman Schofield’s brilliantly succinct (albeit sometimes cryptic) survey of the entire rational choice program and its bearing on the issue of stability versus chaos, and Robert Dahl’s summary of his own work and that of others on the conditions of stable democracy. There are also solid chapters by Pasquale Pasquino on early history of the concept, Nicholas Miller on the conditions under which majority rule oppresses minorities, Thomas Christiano on the requirements of deliberative democracy, Elizabeth Kiss on nationalism, and Richard Arneson and Ian Shapiro on *Yoder*. Leaving aside those to be mentioned later, the other chapters—slighter but also of value—are by Deborah Satz, Lainie Friedman Ross and David Schmidt, and Robert Goodin.

The most original and stimulating contribution is James Scott’s “State Simplifications: Nature, Space, and People.” The basic idea here is that, in order to make sense of the societies they are trying to govern, state officials have to impose drastic analytical simplifications, but they are then driven to change the reality to fit: “The utopian (immanent) tendency of the modern state, continually frustrated, is to reduce the chaotic, disorderly social reality beneath it to something more closely resembling the administrative grid of its observations” (p. 57). Starting with Prussian and Saxon scientific forestry in the late eighteenth century, Scott develops a critique of what he calls “high modernism,” whose exponents include the founders of the TVA, Le Corbusier, Lenin, and (an extended example) Nyerere. He points out that the results are most tragic in the (ex-) second and third worlds, where forces capable of restricting crazy schemes

(such as collectivization, the Great Leap Forward, Virgin Lands, huge dam projects, and so on) are lacking. (On a more modest scale, recall that Le Corbusier’s only really big chance to mess things up came in India. Even in France, the most technocratic first-world society, his most grandiose projects were frustrated.)

Scott draws a contrast between this “utopian modernist vision” and “*mētis*,” which is “the kind of practical skills acquired in responding to a constantly changing natural and human environment” (p. 75). To any political theorist, this sounds uncannily like Michael Oakeshott sailing the boundless sea, and though he is not mentioned, his contrast between “rationalism” and following traditional practices is very similar to Scott’s distinction. Thus, *mētis* is relevant where “skill is typically acquired through practice (often apprenticeship) and a developed ‘feel’ or ‘knack’ for strategy” and in situations that “resist simplification to deductive principles which can successfully be conveyed through book-learning” (p. 76). The major difference is that Scott’s examples are more persuasive than Oakeshott’s strained attempt to portray Clement Attlee as a reckless revolutionary.

A serious miscalculation is the 74 pages allotted to an exchange between Karen Orren and Stephen Skowronek, who get a joint statement and a rebuttal, and two of their victims, Walter Dean Burnham and Morris Fiorina. It is hard to tell what if anything is at stake here, if only because “intercurrence,” advanced as a theoretical panacea, does not appear to be a theory as against (to adapt Burnham) the assertion of “one damned thing at the same time as another.” In any case, a dispute that can be properly evaluated only by those with a minute knowledge of the origins and history of the ICC is surely out of place in *Nomos*.

Finally, a few curiosities. John Gray tells us that he has changed his mind, but scarcely why, and the phenomenon itself occurs too often to be significant. Shelley Burtt apparently has no difficulty with the desire of the *Mozert* case parents to avoid their children’s exposure to the major literary and scientific achievements of Western civilization on the ground that “they will not be able to shield their children entirely from the country’s secular, highly commercialized mass culture” (p. 433)—as if toys and television (her own two examples) were a substitute! This is sad, but not as sad as Jennifer Nedelsky’s revelation that the only time she has ever felt free of the fear of rape was at the Michigan Women’s Folk Festival (p. 494). I suspect, however, that even Canadians (many of whose ancestors fled the promise of “life, liberty, and the pursuit of happiness” and are still dubious of numbers two and three) will eventually balk at the remedies she proposes, which would eliminate basic legal safeguards such as *men rea*.

In sum, this is a pudding containing one silver dollar, a number of plums, and some bits that should have been caught in the sieve.

The Quest for Evolutionary Socialism: Eduard Bernstein and Social Democracy. By Manfred B. Steger. Cambridge: Cambridge University Press. 1997. 287p. \$64.95.

Edwin A. Roberts, *California State University, Long Beach*

The best scholarship often serves a dual purpose, in helping to place ideas and events in a proper context for those who have not done research in a particular area and in challenging our perceptions about their meaning and nature. At times this results in a mixed reaction: We admire a book at one level but are in disagreement at another. My reaction to this new political biography of Eduard Bernstein is that while I

can admire it as a comprehensive overview of the life and thought of one of the most influential figures of the twentieth-century European Left, I reject the book's central premise, as I believe it is demonstrably false.

Eduard Bernstein (1850–1932) was a journalist, editor, and leading figure in the German Social Democratic Party (SPD) from the 1880s until his death. He is most famous for the book *Die Voraussetzungen des Sozialismus und die Aufgaben der Sozialdemokratie* [*Evolutionary Socialism*] (1899). In it he advocated revision of such key elements of classical Marxist theory as the inevitable breakdown of capitalist production, the growing antagonism and polarization of social classes, and the need for a socialist revolution. In their place, he defended the notion of a growing cooperation between workers and the middle class, the gradual evolution of capitalism into a system of rational socialized production, and the need to defend socialism as a Kantian ethical imperative, rather than on a scientific analysis of the system's inherent contradictions.

To this point, there has been a general agreement among scholars that Bernstein's actions were motivated mainly by his belief that the SPD's reformist practices did not match its revolutionary rhetoric, and that the two should be brought more in line. At the same time, scholars with varying degrees of sympathy for Bernstein, such as George Lichtheim, David McLellan, Lucio Colletti, and Leszek Kolakowski, have testified to his basic lack of rigor in conceptualizing problems and his misunderstandings about key elements of Marxist theory. Against this tendency, Steger argues that Bernstein's work did represent a coherent (and even superior) alternative to Marxism as a basis for socialism. His thesis is that Bernstein's model of evolutionary socialism was a pioneering effort to reconceptualize the relationship between liberal and socialist theory, allowing for a more constructive understanding of the problems of democratization, political morality, international relations, and social reform. In this, Bernstein becomes the initiator of a new synthesis combining the historically necessary ideal of socialism with the "eternal values" of liberalism (p. 8).

Steger calls Bernstein's project a *quest* for two reasons, one stated, the other implied. According to Steger, "the term quest connotes an almost romantic adventurous journey with no fixed destination yet guided by a noble vision" (p. 15). What this implies is his realization (and acceptance) of the fact that Bernstein never articulated a coherent theory of what he understood as evolutionary socialism. It is in this area of defending Bernstein as a significant (rather than influential) socialist thinker that I find fault with Steger's work.

In the Introduction, Steger quotes Rosa Luxemburg, who in her famous polemic against Bernstein, *Reform or Revolution?*, commented that his work amounted to "a pile of rubbish, in which the debris of all systems, the pieces of thought of various great and small minds, find a common resting place" (p. 5). Steger's study is an attempt to cast doubt on this judgment. Yet, often, despite the author's best efforts, Bernstein appears as a thinker of extraordinary shallowness, whose eclectic approach to theoretical problems seems to have caused confusion among many would-be followers and aggravation to those who knew better.

Steger claims that Bernstein's intellectual limitations can be seen as irrelevant to his power as a political theorist because, Steger maintains, history has vindicated his desire to build a grand coalition between socialists and liberals which, Steger argues, would have helped Germany become a stable liberal democracy that presumably would have evolved into a working form of socialism (p. 10). This lesson, Steger claims, is made all the more relevant and urgent due to the current

crisis of socialism caused by the collapse of the Soviet empire and the debilitation of European social democracy. In saying this Steger identifies his work with the genre of *fin-de-siècle* or endism. Relating his work to the various post theories of the recent past, such as postmodernism, post-Marxism, and postliberal democracy, Bernstein's evolutionary socialist quest is presented by Steger as the only workable vision for our postsocialist era.

This is the first major work on Bernstein in English since Peter Gay's *The Dilemma of Democratic Socialism* (1952). Writing at the height of the Cold War, Gay attempted to build up Bernstein as an alternative to Marx, as one whose legacy was simply ceded to Soviet communism. The dilemma to which Gay's title referred was in building a coherent democratic socialist theory out of Bernstein's writings that could match the power and success he conceded to the Soviet authoritarian model. Steger's book represents a similar ideological maneuver, in that we are supposed to link the collapse of the Soviet empire with the failure of Marxism. Once again, the specter of Bernstein is raised as providing an alternative to Marx and the only hope for socialist renewal. Instead of being the patron saint of Cold War social democrats, as in Gay, Bernstein is read by Steger as anticipating many of the concerns of post-Marxists, postliberal democrats, and communitarians.

Steger argues that his is a hermenutical, political, and historical work in that he wants us to understand Bernstein as the product of his era and of the emergent political circumstance of his age. I am in full agreement with him on this, but I would add, in agreement with L. Colletti, that Bernstein's views are not only incomprehensible but also irrelevant outside the context of the struggles within European Marxism in the pre-1914 era. Unless one is addressing the type of mechanical, fatalistic, and determinist Marxism at which Bernstein's claims were directed, his view offers little of consequence. Yet, even in this context, I would argue that Bernstein was neither an original nor a very profound thinker.

Steger wants us to see that, regardless of his own views, Bernstein did not so much revise Marx as adopt an alternative outlook. This is true, but what is even more interesting is that he did not so much develop an original argument of his own as simply borrow the ideas of non-Marxist thinkers, virtually without qualification, and concoct them into an eclectic stew of often conflicting claims. His economics derived from Fabian capitulations to neoclassicism. As with the former, the latter's subjectivism, individualism, and anti-socialist premises were conveniently overlooked. His politics were an odd combination of idealist and utilitarian strains of liberalism, which took far too seriously the ideological self-image of nineteenth-century Britain as the vanguard of civilization and liberty. His philosophical positions, which Steger continually vaunts as a rejection of Marxism's Hegelian *residue*, were taken directly from the vulgarized neo-Kantianism of F. A. Lange, a charlatan whom Marx himself had exposed as having not the slightest idea as to the substance of the Hegelian dialectic or Marx's own critical reading of it (see Marx, *Letter to Kugelmann*, 27 January 1870). All of this Bernstein connected to an aggressive positivism that was as reductionist, deterministic, and scientific as anything found among the orthodox Marxists he denounced.

A major example of Bernstein's theoretical poverty is found in one of his only original theses, that the concentration and centralization of capital would lead toward greater freedom and form the basis for the evolution toward socialism. Bernstein has been proven wrong on both counts. The tendency of capitalist concentration has become the hallmark

of the modern economy, with buy-outs, mergers, and government-subsidized monopolies playing the leading role in capital expansion and accumulation. Yet, these developments have shown no tendency in favor of spreading either democracy or socialism. Instead, the drive for profit maximization and capital accumulation has tended to enhance the priorities of privatization and the upward concentration of wealth. This is something that the most sophisticated Marxists (such as Luxemburg) have always understood.

Steger highlights a number of Bernstein's interesting attempts at ideological compromises with the German bourgeoisie, most of which resulted in odd theoretical concoctions of dubious political and intellectual value. In the years just before World War I, he tried to appease middle-class opinion with a theory he called "socialist colonialism," which argued that workers and the bourgeoisie had a common interest in colonialism as members of a *higher civilization*, and it was necessary to tame savage cultures (p. 207). Steger explains this theory well but then takes the questionable step of comparing it favorably against orthodox Marxist theories of imperialism (i.e., Kautsky and Hilferding), simply because it was less antagonistic to liberal opinion.

A strong indictment of Steger's thesis is that he himself provides abundant proof that the majority of German liberals never wanted an alliance with the socialist movement and continued to make compromises with the forces of reaction. This, in fact, is the best element of his book. Despite his shortcoming in understanding Bernstein's theoretical failures, Steger shows himself a first-rate political historian in explaining the struggle between liberals and the SPD over the direction of German social reform between 1904 and 1922. He provides one of the clearest analyses available in English of how the victory of *Praktiker* (pragmatic opportunists) within the leadership of the SPD and the main currents of German liberalism helped to frustrate and destroy the hope of significant elements of the population for real reform (pp. 189–97). As a consequence, significant elements of the population became frustrated and drifted toward reactionary nationalism and chauvinism as substitutes for social justice and political equality. I recommend Steger's book expressly for those chapters in which he brings this material to life. I remain perplexed, however, as to how this could be used as evidence to support his case for Bernstein's evolutionary socialism/liberalism.

Bernstein himself did oppose the *Praktiker*, yet he did more to encourage this tendency than any other thinker. Steger realizes this and provides a fitting summary attesting to Bernstein's failings as a political thinker. Says Steger: "Bernstein had a poor eye for the tendency of reformism to breed technocrats who follow electoral imperatives and let their political activities be guided chiefly by self-interest and the immediate material concerns of their constituencies" (pp. 13–4). In admitting this, Steger should also accept that these flaws are inherent in liberal ideology and congruent with capitalist society. The principal legacy of Marxism is in making the case for socialism dependent on the transcending of liberalism and the capitalist system. The deficiency in Bernstein's work was in losing sight of this, and it remains the central flaw in this otherwise learned book.

Free Markets and Social Justice. By Cass R. Sunstein. New York: Oxford University Press, 1997. 416p. \$35.00.

Peter Berkowitz, *Harvard University*

In politics as in political science and legal scholarship, the world sometimes seems to be divided into those who think

that for the sake of efficiency as well as justice markets must be free from regulation by morals and those who believe that, considerations of efficiency notwithstanding, justice demands that morals govern markets. In his instructive and admirably balanced new book, Cass Sunstein contends that, for all concerned, this is a bad way for the world to be divided.

Sunstein sets out to show the superiority of a third view: Markets and morals exercise a reciprocal influence on each other, and a respectable political science and a responsible jurisprudence must grasp the complicated relationship between them. In support of his thesis, Sunstein examines a remarkable range of ideas and issues: the ambiguity of preferences; the need to devise empirical measures of human well-being to solve problems of adjudication and public policy that arise in the modern welfare state; the complex origins, the pervasive influence, and the political regulation of social norms; why markets alone cannot put an end to discrimination; free speech issues raised by the internet; constitution making in Eastern Europe; the relation among property rights, democracy, and constitutionalism; neglected consequences and complicated trade-offs in the regulation of the environment and health; and the project of using the legal system to democratize America. In making his case, Sunstein is conscientious about introducing qualifications to his claims; drawing out problems of implementation inhering in his reforms, and identifying dangers associated with his programs, though occasionally he blurs the distinction between openly acknowledging a difficulty and responding to it by scaling back his theoretical ambitions or revising his political programs.

The two crucial and connected points, to which Sunstein returns again and again, are that markets are complex institutions and that morals are an irreducible element of social and political life. It is not exactly that there is no such thing as a free market or that morals are everywhere, but that free markets cannot be understood in isolation from beliefs and practices, especially beliefs about what is just and good for human beings and practices that prepare or prevent one from participating effectively in commercial, democratic society. Moreover, because they depend on and are partly constituted by law, free markets are not only more complex but also less autonomous than they sometimes appear. For example, the law of property provides rules of entitlement, and the law of contract establishes rules of transfer. And these fundamental legal rules are themselves not made by markets but, rather, play a constitutive role in making market relations possible and efficient.

Sunstein has a practical motive for bringing into focus the array of background conditions necessary to make markets work. He wants to show that current market thinking is insufficiently attuned to the harmful effects of background conditions that are unjust. But he makes this point as a friend of markets, and in the same spirit he seeks to show that current thinking about social justice is inadequately alert to the benefits markets confer. Indeed, for those who are inclined to see nothing but selfishness and exploitation in market relations, his message is that more appreciation must be mustered for the role that markets play in promoting the prosperity that is one of the key preconditions for a life of liberty.

Another leading theme of Sunstein's book is that legal controversies and disputes about public policy often turn on empirical questions that seldom receive the attention they deserve. Sunstein practices what he preaches, displaying a refreshing command of facts and figures. Although he occasionally disappoints by drawing back from making the prescriptions he thinks judges and government officials should be

capable of issuing. Sunstein does offer a respectable assortment of ideas for making the law, on the basis of better empirical research, more responsive to the claims of efficiency as well as social justice. For example, on the grounds that human well-being is to a significant extent capable of empirical measurement and should be taken into account in policy planning, regulatory reform, and democratic deliberation by the people, Sunstein recommends that "the American government should compile and distribute an annual 'quality of life' report, including among other things, per capita income, poverty, housing, unemployment, average weekly earnings, inflation, child mortality, longevity, subjection to violent crime, literacy, and educational attainment" (p. 123).

Sunstein, in short, envisages an active, energetic, and big government that both respects the requirements of the market and plays a major role in securing the material well-being, and promoting the autonomy, of its citizens. Given the precarious balancing act that he has set out to perform, it is perhaps not surprising that the lucidity with which he presses his cases sometimes works to obscure a certain slippage in his argument. So, for example, while he is right that much which is treated as natural or inscribed in the order of things is in fact a function of custom and law, he occasionally wrongly implies that beliefs and practices that can be shown to have a human origin or to have undergone an alteration in history are therefore proper objects for state action. Similarly, he sometimes argues that if a preference is indirectly or inevitably affected by law, then the law is justified in directly regulating it. But from the fact that law affects the formation of a preference it is invalid to infer that "it is *fully* legitimate for government and law to try to shape preferences in the right way, not only through education, but also (for example) through laws forbidding racial discrimination, environmental degradation, and sexual harassment, and through efforts to encourage attention to public issues and to diverse points of view." (p. 5, emphasis added). Gliding on occasion too quickly over the imperfect but necessary distinction between regulating behavior and regulating belief, Sunstein sometimes understates the importance of considerations that compel caution when it comes to putting government in the business of preference regulation: The cumbersome apparatus of government may be poorly suited to the complex task of forming preferences; even if it could form preferences effectively, government may be in a bad position to determine which preferences are the right ones; and using government to form directly the right preferences is rarely more than a short step away from using the organs of the state to supervise thought.

Sunstein himself emphasizes that inviting government to form the right preferences involves "serious risks of overreaching" (p. 20). In fact, in his discussion of "the project of norm management" (p. 59), he confronts the concern that using the law to make men and women moral invades individual liberty. He replies that government action designed to alter norms can be justified to promote liberal ends, such as material welfare or personal autonomy. Government, he stresses, should use the least intrusive means available, beginning with the simple provision of information and including campaigns of persuasion; taxing or subsidizing choices; imposition of time, place, and manner restrictions on particular activities; and, on some occasions, if necessary, straightforward coercion through legal prohibitions (pp. 56–7). Despite his forthright acknowledgment that the regulation of beliefs by government involves dangers, Sunstein in this case may not give the dangers their due. For while he is right to point out that a project is not invalidated just because it is liable to abuse, it also needs to be noted that to win support

for a project it is not sufficient to show that in principle it may yield benefits. In short, Sunstein does not quite manage to dispel the anxiety that what he delicately refers to as "norm management" must be implemented and enforced by what others would be inclined to call "thought police."

Sunstein's enthusiasm for norm management is one expression of his commitment to using law to promote democracy: "Few matters deserve higher priority than institutional changes designed to increase the democratic character of the modern state" (p. 318). To this end, he proposes three general reforms which, he convincingly argues, would promote efficiency as well as democracy: more education, the replacement of command-and-control regulation with economic incentives, and decentralization.

At the same time, Sunstein's own extended analysis of the presuppositions and background conditions that make markets work leads one to wonder whether every "increase in the democratic character of the modern state" would be good for democracy. The powerful arguments that Sunstein himself develops to show that free markets depend upon legal regulations and social restraints and that market practices must always be evaluated with a view to "human interests" or "human purposes" suggest, contrary to John Dewey's principle, that more democracy is not always good for democracy.

Indeed, by refusing to treat free markets as ends in themselves and through the subtle assessment of markets' vices as well as virtues, Sunstein invites the thought that democracy, like markets, has vices as well as virtues, and more democracy, like more freedom in the marketplace, does not automatically guarantee greater efficiency or greater human well-being. His general approach also encourages the supposition that democracy is good in terms of the human purposes it serves and that sometimes regulation and restraint is what is required for democracy's defense.

America's Bachelor Uncle: Thoreau and the American Polity.

By Bob Pepperman Taylor. Lawrence: University Press of Kansas, 1996. 180p. \$25.00.

Michael A. Mosher, *University of Tulsa*

Although the author says he was often exasperated with Thoreau, he seems to have cured himself of any lingering irritation. The attitudes that make others cross are downplayed. Even the appeal to an avuncular, indulgent identity, "America's bachelor uncle," provides a soft focus on Thoreau's wilder edges. Thoreau's political implications are both expounded and ardently defended, with the significant exception of some of the claims about "nature."

One finds intelligent, informed accounts not only of the classics, *Walden* and "Civil Disobedience," but also of several of the less well-known pieces as well. Ostensibly travel writing, *A Week on the Concord and Merrimack Rivers* is, Taylor shows, Thoreau's voyage back in memory to America's founding in bloodshed between Indian and white. This is not the usual preachy message. Taylor notes how Thoreau accommodated himself to the fierce virtues of morally ambivalent characters like the Indian fighter and hater, Captain Lovewell, or Hannah Dustan ("this awful woman," Hawthorne called her), who out of revenge for the murder of her child, killed and scalped ten Indians, including six children! Hawthorne's and others' "less satisfactory moral responses" are due, Taylor speculates, to their not having Thoreau's hardheaded realism or his sense of "the flow and brutality of history" (p. 30). In this century, of course, such "historicists" have ended up justifying terrible deeds. We might instead consider Thoreau an old-fashioned antiquarian: Greek in his

admiration for the *Iliad*, that ancient story of aristocratic warriors, as a model of American beginnings; Roman in a praise of America's rude founders that matches the spirit of Tacitus' contrast of the barbarian virtues of the Germans to Italian decadence.

Taylor organizes his chapters around five "representative types" found in Thoreau. In *The Maine Woods*, we have (1) defeated Indians and (2) the morally worse but spiritually superior conquerors, white frontier settlers. Economic ambitions led to the eradication of a frontier that made such distinctive virtues possible. This tale bears a remarkable likeness to Frederick Jackson Turner's own adaptation of Tacitus, a yarn in which Western settlers, instructed by both the "civilized" East and the "savage" frontier, become admirably independent characters tragically unable to reproduce themselves with the passing of frontier society.

In *Cape Cod*, we are shown (3) America's not always successful communal results of the puritan experiment in living, as Thoreau once put it, "with high and earnest purpose" (p. 55). The "idealistic" Cape villagers were cruelly indifferent to a shipwreck of Irish immigrants, given to cold bare-bones charity, distrustful of outsiders, and willfully ignorant of anything not part of the history of their own people. Oddly, Taylor seems defensive about the recurring charge that in such misanthropic accounts there was more than a little Nietzschean attitudinizing. Sure, I know Nietzsche came later, but both Nietzsche and the American transcendentalists were philosophical responses to a common heritage, German philosophical Idealism and, behind this, pietistic Christianity, both given to agonizing self-critical accounts of the radical good and evil in human nature. Like Nietzsche, Thoreau is self-critical enough to be ambivalent about the "good" and is tempted to claim that moral idealism masks cruelty and hypocrisy in comparison to which "barbarian" wildness looks healthy.

Taylor comes close to saying this himself about Thoreau, beginning with his claim for Thoreau's ambivalent admiration of Captain Lovewell and Hannah Dustan and continuing through the elaboration of his five types, including (4) the vigorously amoral capitalist (the subject, Taylor says, of *Walden*) and (5) the wild men of rebellion like the antislavery warrior, John Brown. Thoreau was not, we are assured, morally squeamish about "violent resistance to injustice" (p. 113). Brown is apparently "the model of the free American, a symbol of our national promise" (p. 107). I think we can see—though Taylor does not claim this—how appreciation for Brown is all of a piece with admiration for Captain Lovewell. As Thoreau wrote in his *Journal* (Taylor makes it the epigram to the chapter on Brown), "I wish my neighbors were wilder" (p. 99). Nevertheless, Thoreau's claim that nature was "an alternative source of inspiration" and instruction in "independence" disturbs the author. They were "not always appropriate attitudes" (pp. 127–8). But does not Thoreau's admiration for Brown's incendiarism require some such escape hatch from conventional moral judgment? Thoreau writes: "I love the wild not less than the good." Taylor finds this "startling" (p. 94). He valiantly strives to bring morality and nature together in Thoreau, but this collapses a major tension in the thinker's work.

Taylor gives us an old-time radical approach to *Walden*. Thoreau is now a programmatic anticapitalist "at war with the political economy of the age" (p. 91). Maybe, but as Taylor notes, Thoreau also finds the following virtues in such an economy: "energy, drive, ingenuity, and industry," along with "enterprise and bravery," which is "unexpectedly confident and serene, alert, adventurous, and unwearied" (p. 96).

This last is about as elegant an update of the Homeric warrior as one could desire.

Taylor nods approvingly at a Rabbi Nahman tale in which the master of prayer rails: "Chasing money is 'not the purpose of life at all' . . . the purpose of life is to be engaged in Torah and prayer." Of course, Taylor concludes, the "moral equipment" of normal people is too "limited" for them to get the message (pp. 76–7). This is a deeply illiberal claim. It lacks respect for the autonomy of persons to choose their own good. Is Thoreau in the same authoritarian boat? He proclaims that the nation has been "ruined by luxury and heedless expense . . . the only cure . . . is a rigid economy, a stern and more than Spartan simplicity of life and elevation of purpose" (p. 122). As a recommendation that some try "voluntary poverty" (p. 91) this is all well and good, but as a political program, this could commend itself only to the old Khmer Rouge. Thoreau (and Taylor) complain: "There are very few halls for free worship and free speech in this country" (p. 85). America may be damned for many reasons, but surely not for this! In any event, if the capitalist economy is such a roadblock to freedom, is the alternative (as Taylor hints at but never quite says) still socialism?

Not despite my misgivings but because of them, I can recommend this provocative interpretation of Thoreau. It is eminently readable and opened my eyes to new ways of understanding a complex thinker, even if ultimately I departed from the conclusions of the author. Taylor is at war with the other commentators, and this, too, makes for lively reading. One, Nancy Rosenblum, is an often-cited foil to his views. It is a pity he never sets out more systematically either her claims or his considered response to them. A paper edition ought to do this as well as correct page 125, where Rousseau is the clearly intended reference, not Plato.

Republican Paradoxes and Liberal Anxieties: Retrieving Neglected Fragments of Political Theory. By Ronald J. Terchek. Lanham, MD: Rowman & Littlefield, 1997. 275p. \$67.50 cloth, \$24.95 paper.

Joseph M. Knippenberg, *Oglethorpe University*

Surveys of contemporary political theory often dwell on the so-called debate between liberals and communitarians. Drawing—sometimes loosely—upon the tradition that is usually said to begin with John Locke's *Two Treatises of Government*, the former develop elaborate theories of rights to justify or criticize contemporary practices and understandings. The latter construct a critical response to the currently dominant language of rights from materials taken especially from "modern" (i.e., Machiavellian and Rousseauian) reconstructions of classical republican political practice. As a debate, this conflict is not particularly satisfying. On the one hand, liberals and their libertarian cousins continue to write and speak in terms of rights, largely ignoring challenges from the communitarian quarter. On the other hand, communitarians spend a great deal of time insisting upon the poverty of what they regard as a myopic focus on individual rights, at the expense of such considerations as the common good, citizenship, and virtue.

Terchek contributes to this debate by attempting to build a bridge between the two sides, contending that they can learn, not only from one another but also even more from their own traditions. Thus, he finds in the liberal tradition a concern with the kind of civic and personal virtue necessary to sustain a political order devoted primarily to the protection of rights and in the communitarian (or, more precisely, republican) tradition a hard-nosed and pragmatic concern with giving

individuals concrete stakes in their political order. Focusing on the works of "strong republicans"—Aristotle, Machiavelli, and Rousseau—and "anxious liberals"—Locke, Smith, and John Stuart Mill—Terchek attempts to bring these "fragments" of the past to bear on contemporary political questions.

On one level, he succeeds. The liberal and republican traditions offer rich materials for reflection, which have been mined only selectively by clever but ultimately shallow contemporary theorists. Liberals have paid insufficient attention to the "civic" dimension of their tradition, assuming that an appropriately rigorous theory of rights would be sufficient to guide an activist government—led, perhaps, by the judiciary—in the construction of a generous welfare state. Recent work (see, e.g., Lorraine Smith Pangle and Thomas L. Pangle, *The Learning of Liberty*, 1993) has reminded us of how much serious thought liberals once gave to the question of civic education. Unlike contemporary liberals, who may well be overconfident about the capacity of people to listen to reason and heed the lessons of theory, "anxious liberals" were well aware of our capacity to abuse the rights we have gained or been granted. Communitarians, in turn, have often been "high-minded" in their emphases on moral virtue and common traditions, writing as if the material concerns of ordinary people were of little moment and as if "tradition [could] serve as the foundation, superstructure, and glue of the good society" (p. 50). Even a cursory glance at the works of "classical republicans" would correct this oversight; it would be impossible to assume that someone like Machiavelli overlooked the role of self-interest in politics.

This is not to say, however, that Terchek's contribution to and correction of the contemporary discourse is altogether satisfying. The fragments he draws from the republican and liberal traditions may well serve as correctives to the oversights and excesses of the two contemporary camps, but they are more politically salutary than theoretically adequate. Thus, for example, Terchek's account of Machiavelli the republican (heavily influenced by Pocock's *The Machiavellian Moment*, 1975, and Skinner's *The Foundation of Modern Political Thought*, 1978) shows little evidence of a careful critical encounter with *The Prince*, let alone a serious effort to reconcile the teachings of that work with *The Discourses*, an ostensibly more "republican" book. Where one might expect an emphasis on the role of ambitious political leaders, even in the sectarian or partisan politics of republics, one gets instead a much less plausible account of how the people more or less spontaneously rise to assert or protect their liberty (see, e.g., pp. 104–7).

A similar flaw mars Terchek's account of Locke. One difficulty with which any student of the *Second Treatise* must come to grips is to explain why there would ever be a need to abandon the state of nature for civil society, if our natural reason were such an effective guide to leading our lives together. Terchek offers a very ingenious explanation, reminiscent of Rousseau's *Second Discourse*, focusing on the way in which the invention of money (something that, at least in his account, seems accidental) opens up possibilities that exceed the rational control of ordinary human beings (see pp. 132–4). While this version of events paves the way for his argument about the roles of education and Christian culture in enabling us to reassert rational control over our impulses (pp. 134–7), it overlooks evidence in the *Second Treatise* itself that would point in a different direction. Indeed, there are plentiful indications of the frailty of human reason even before money arrives on the scene. Why, for example, talk about enforcing the law of nature and the problems posed by "the boundless extravagancy of . . . will" (see, e.g., *Second*

Treatise, paras. 7–8, 11) if everyone so readily listens to his or her reason? For those who attend to the hints early in the work, the later claim that human beings are in general no great observers of the law of nature (*Second Treatise*, para. 124) comes as much less of a surprise than it would to one who followed Terchek's account. An interpretation that relied somewhat less on the actual or potential strength of reason would also pay greater attention to the role that might be played by an appeal to particular passions, such as fear and the desire for comfortable self-preservation, in the establishment and maintenance of a civic order. While this would not diminish the power of Terchek's insistence upon the importance of education and Christian culture in supporting liberalism, it might shed more light on the character of both the education and the religion that Locke's liberalism requires. In sum, a more careful reading of Locke might yield a richer and more nuanced—although politically less immediately useful—account of the anxieties to which thoughtful liberals address themselves.

It is tempting to conclude that Terchek is to some extent guilty of the same fault with which he taxes contemporary liberals and communitarians. While his interpretation of the traditions emphasizes different elements than they do, he, no more than they, enables us to learn everything the traditions may have to teach us. Whenever the concerns of contemporary political discourse are preeminent in our approach to our philosophical heritage, we hear what we want to hear and see what we want to see. We may be edified and edifying, but we do not truly confront the challenges posed by the thought of the past. By inviting us to return to the past, Terchek has done us a service. But we need a deeper immersion in those texts and traditions than he offers us.

Social Justice in a Diverse Society. By Tom R. Tyler, Robert J. Boeckmann, Heather J. Smith, and Yuen J. Huo. Boulder, CO: Westview Press, 1997. 305p. \$60.00 cloth, \$24.00 paper.

Grant Reeher, *Syracuse University*

This book is a cumulation and synthesis of extant social psychological research on the beliefs and feelings about social justice held by persons as individuals and as members of groups, as well as the behavioral effect of those beliefs and feelings. It would be useful as a reference guide for political scientists conducting research or teaching in social justice, from either a theoretical or empirical perspective. It also would be useful as a text in graduate courses about or related to justice and might even serve well in an upper-level undergraduate course.

The authors begin with the claim, thoroughly substantiated, that beliefs and feelings about justice matter both for other important beliefs and feelings and for behavior: "Judgments about justice mediate between objective circumstances and people's reactions to particular events or issues" (p. 6). And these judgments matter in an enormous variety of contexts, which include "almost all settings in which people interact with one another, either as individuals or in groups" (p. 9).

The findings are organized around two overlapping categories: four historical "waves" of justice research and five key topics concerning justice research writ large. The four waves are relative deprivation, distributive justice (in terms of outcomes, mostly of goods, pay, and promotions), procedural justice (both resolving conflicts and making allocations), and retributive justice. The five topics are the ways in which judgments about justice influence other feelings and atti-

tudes; the criteria employed to assess justice; the behavioral consequences of perceptions of justice and injustice; the motivations behind caring about justice; and the circumstances under which concerns about justice matter most. Though the book seems intended for audiences beyond the United States, most examples come from this country. The authors present much useful material on all these waves and topics. Indeed, perhaps the book's main strength is its extensive review of the research; the references section is 35 pages of small type.

Although overall substantive themes are somewhat difficult to tease out of the book, for reasons described below, three in particular struck me as the most important. First, social justice matters to people not simply for rational, self-interested reasons, and their views about justice are not simply rationalizations for self-interest. This casts further empirical doubt on rational choice models of human motivation and behavior. Second, whether people think of themselves as individuals or as members of groups is critical in their justice judgments and their tendency to act upon them. Third, in general, judgments about justice, and their behavioral influence, are extremely complicated; there are a number of intervening variables in any given situation.

At times the authors dwell too much in the details of the research they report. The book would have benefited from a higher level of synthesis built around overarching themes and arguments. Even within chapters, the organization seems to be driven more by the particular research projects described than by an overall conceptual scheme.

I have other quibbles. First, the title, *Social Justice in a Diverse Society*, suggests something different from what is actually delivered. The topic of multiculturalism, diversity, and social justice is not directly addressed until the last 16 pages.

Second, the influence of socioeconomically based political power on the subjective evaluations of justice is underemphasized. The use of this kind of power by the advantaged on the disadvantaged influences not only the content of justice beliefs but also the perceptions of when justice claims are appropriate, the conceptions of self and others that figure importantly in justice judgments, and the tendency to act on those judgments. Perhaps this underemphasis is due to the social-psychological versus political science focus of the work, or to the heavy reliance on experimental research. Nonetheless, it is a problem that haunts almost the entire book. The book is somewhat stronger in this regard when it treats the behavioral consequences (and nonconsequences) of justice beliefs.

Third, the effectiveness of the book is lessened by several instances of careless reasoning and use of substantiating examples. I offer just a few samples here, from the chapter on retributive justice: On the incompleteness of equity as a principle in retributive justice, the authors invoke the phenomenon of returning a punch with a harder punch; on the limits of using compensation when a crime involves "immoral behavior," the authors invoke the relatively greater grief over having irreplaceable personal items stolen from a home rather than replaceable impersonal items of monetary value; on policies toward rule breaking, the authors state that spending on prisons makes society more poorly educated because prisons are funded by the same funds spent on public education; on the notion of "global association" in moral responsibility, the authors invoke the Israeli practice of dynamiting the homes of the families of terrorists, without considering deterrence effects. There are similar instances of these problems in other chapters.

Despite these drawbacks, I still find this book to be an

important and useful reference source for political scientists working on justice. It will remain on the shelf next to my desk.

Randolph Bourne and the Politics of Cultural Radicalism.

By Leslie J. Vaughan. Lawrence: University Press of Kansas, 1997. 268p. \$35.00.

Manfred B. Steger, *Illinois State University*

In the raging controversies of our time over issues of social and political identity, difference, and cultural pluralism, currency often trumps historical memory. To be sure, it would be foolish to dismiss the significance and relevance of various postmodern perspectives at this fin-de-siècle moment. Still, much of the contemporary debate on American culture and its connection to political radicalism and social protest has been confined to a historical context that rarely reaches farther back than the 1960s.

In her timely study of the legendary political essayist Randolph Bourne, Leslie J. Vaughan, a frequent contributor to such prominent publications as the *Atlantic Monthly*, the *New Republic*, and the *Masses*, and leading critic of U. S. military involvement in Europe, fortunately bucks this trend. She skillfully expands the narrow historical boundaries of the present American political discourse on multiculturalism, localism, and the limits of liberalism by locating its roots in the "little rebellion" that swept New York's Greenwich Village in the decade preceding World War I. Characterizing the hunchbacked and self-identified "outsider" and "social misfit" (who died poor and lonely in 1918 at the age of 32) as "a confirmed modernist who anticipated the 'post-modern,'" Vaughan seeks to show that Bourne's thought is valuable for today's discussions "precisely because it offered a new political discourse and set of cultural possibilities for American society at the height of the modern age" (pp. 4–5).

Rather than relying on a conventional biographical format that adheres to a strictly chronological framework, the author chose to organize her book along thematic lines. After three short introductory chapters, the book presents Bourne's life and work as texts to be interpreted within the political economy and psychosocial history of their time. Chapter 4 assesses Bourne's use of irony as a stance of political engagement, skepticism, and commitment to radical dissent that reflected his unwillingness to resolve irreconcilable theoretical contradictions. Chapter 5 deals with Bourne's "philosophy of youth," particularly as it emerged in his confrontation with Walter Lippmann, who, in his famous *Drift and Mastery*, defended the scientism and positivism of the new professional business administrators in charge of streamlining production and rationalizing employment practices. In a particularly readable section of this chapter, Vaughan offers an innovative interpretation of Bourne's arguments in favor of feminizing American culture. Chapters 6 and 7 revisit Bourne's famous opposition to the Great War and its virulent evocations of ethnonationalism, famously captured in his witty observation that "war is the health of the state." Seeking to reposition Bourne's thought at the center of debates about the nature and limits of American liberalism, Vaughan offers an insightful reading of his "prefigurative politics" of a "democratic transnationalism" as a variant of a "cultural politics beyond militarism, and importantly, beyond liberalism" (p. 141). In the final chapter, Vaughan elaborates on her most ambitious and controversial thesis, suggesting that Bourne's turn to cultural issues did not signal a retreat from political engagement but, to the contrary, represented an intrinsic part of his political theory. While she concedes that Bourne's cultural radicalism may be interpreted as

merely offering a "creative politics worked out in the unmapped space of the impossible," she confidently insists that his close attention to cultural issues made "sense immanently as a political critique" (p. 144). In other words, like the subject of her biography, Vaughan rejects the liberal bifurcation of culture and politics, claiming that "cultural solutions could stimulate political responses... for the transforming influences of architecture and city planning" (p. 171).

On this issue, the author seeks to defend Bourne against the dominant views of Bourne scholars that emerged in the 1960s with Christopher Lasch's influential study, *The New Radicalism in America 1889-1963: The Intellectual as a Social Type* (1967). Lasch cast Bourne and his fellow "middle-class radicals" as politically alienated neophytes with an infantile craving for oceanic wholeness and unity who subscribed to the naïve radicalism of a "personal politics," which soon ended as an embarrassing retreat into "despair" and "distance" (see also Michael Walzer, *The Company of Critics*, 1988). Conversely, Vaughan argues that Bourne's political temper, although largely anti-institutional, was neither defeatist nor irredeemably negative, but that it represented a viable position from "below the battle." In it she finds a resemblance to a Nietzschean "creative skepticism" that consciously moves between the "is" and the "ought" without dissolving tensions. Indeed, throughout the book, the author highlights the Nietzschean influence on Bourne, apparent in his insistence that, more than the Apollonian will to rationality, order, and self-control, a vital American culture requires the Dionysian impulse toward chaos, creative desire, spiritual adventure, and sinister imaginative excursions.

Yet, Vaughan's attempt to repoliticize Bourne's cultural radicalism reveals the sole systemic weakness of the book: the lack of historical evidence for her central claim that his cultural critique related intimately to actual social and political practice. This is not to say that such evidence does not exist; but beyond some vague references to "neighborhood-based politics of halfway houses, settlements, experimental schools and cooperatives," Vaughan offers little proof that Bourne's call for the pursuit of creative alternatives to impersonal bureaucratic politics touched the lives of working people in tangible ways. For example, did Bourne entertain close relationships to radical political movements such as the Industrial Workers of the World or other anarchist groups? Did he actively participate in radical political action? Did he involve himself in party politics? Unfortunately, Vaughan keeps her readers in the dark about these important political questions, although Bruce Clayton's excellent biography (*Forgotten Prophet: The Life of Randolph Bourne*, 1984) suggests that Bourne was deeply influenced by workers' struggles in the early decades of the twentieth century, such as the long, bitter strike of silk workers in Patterson, New Jersey, and the bloody Wobbly strike at Lawrence, Massachusetts. In order to give her thesis some teeth, Vaughan should have moved beyond rather general statements, noting that "Bourne's political commitments were constantly in flux, contingent on specific circumstances but relying on 'intellectual suspense' to test them critically" (p. 169), and instead have shown more concretely how Bourne applied those "political commitments" in his short life.

Overall, however, *Randolph Bourne and the Politics of Cultural Radicalism* clearly is an important contribution to the study of modern American political thought. Vaughan's excellent grasp of the workings of psychosocial dynamics at the dawn of the twentieth century, combined with her lucid exposition of the connections and tensions among American liberalism, multiculturalism, aesthetics, and democracy, make her book valuable to both a general audience and specialists

in the discipline. The greatest virtue of Vaughan's study lies in her expansion of the parameters of the current cultural debates to include important, but often sorely neglected, American political thinkers who stood at the cusp of the modern and postmodern worlds.

The Career of Toleration: John Locke, Jonas Proast, and After. By Richard Vernon. Montreal and Kingston, Canada: McGill-Queen's University Press, 1997. 164p. \$44.95.

Barry Alan Shain, *Colgate University*

Intellectual history and political theory are hard to differentiate, and when each is done well, they are mutually supportive. At their core, however, are goals which distinguish them and place their aspirations in tension. Intellectual history is primarily concerned with understanding the historical thought of various authors, whereas political theory seeks to extract from them enduring political themes and conceptual maps. The underlying tension between these two ways of understanding is increased when the contemporary student employs the abstract tools of analytical philosophy in his or her exploration. Such tensions are further heightened when the theorist hopes to find historical lessons apposite for contemporary liberal political life.

Notwithstanding these tensions, Richard Vernon uses the tools of analytic philosophy to extract from a seventeenth-century political-theological debate between John Locke and Jonas Proast (a theologically orthodox chaplain at All Souls College) lessons he believes useful to late-twentieth-century liberalism. As he writes in the Introduction, his aims are "to reconstruct the grounds of [Locke's and Proast's dispute, and]... draw attention to the long-term importance of some of their arguments and to evaluate their relative strength," so as to illuminate better the contemporary debate between liberals and academic communitarians (pp. 4, 15). Vernon believes that to ignore the continuing relevance of the Locke-Proast exchange would be "to impose an artificial barrier between the late seventeenth-century and ourselves, and, moreover, to miss the way the seventeenth-century political debate continues to influence and shape our own" (p. 15).

His argument is divided into the Introduction, seven chapters, and a brief but rewarding conclusion. He opens with a rich discussion of belief and its relationship to the will as well as the role of compulsion in shaping belief. Next, he broadly considers the character of "public reason" as found in the thought of Kant, Rawls, Gerald Dworkin, Nagel, and indirectly Locke. In a particularly strong chapter, the third, Vernon draws out the relationship between tolerance and skepticism (both philosophical and political). The fourth chapter considers rather abstractly the "slippery slope" and "can of worms" arguments and then selectively applies them to the Locke-Proast debate. The fifth chapter, in which Vernon wishes to test Stephen Holmes's thesis concerning the enduring structure of illiberal thought, is the least successful but one in which he still manages to provide some thoughtful asides on the Christian character of Mill's thought (p. 103). In chapter 6, Vernon compares Locke's defenses of toleration to that of Berlin and Raz and finds Locke's to be superior. Chapter 7, in which the liberal character of contemporary "deliberative democratic" thought is considered and compared with Locke, is arguably Vernon's strongest. Finally, in the Conclusion, Vernon considers Dunn's remark that he "cannot conceive of constructing an analysis of any issue in contemporary political theory around the affirmation or negation of anything which Locke says about political matters" (p. 143). Vernon recognizes the Protestant partic-

ularism of Locke's thought but nonetheless finds, in opposition to Dunn, that Locke's case for toleration can be usefully extracted from its original Protestant context.

Vernon fails to achieve much of either of his declared goals. He neither illuminates the nature of the seventeenth-century debate between Locke and Proast nor shows how their debate can clarify the debate between liberalism and communalism, either with contemporary communitarians (who are never discussed after the Introduction) or with traditional conservatives (who are treated in a most perfunctory manner). What he does do with gusto and always with intelligence is argue for the superiority of a Lockean liberalism to contemporary liberal alternatives. In particular, his criticism of Amy Gutmann and Dennis Thompson for their misappropriation of Locke for putatively democratic ends deserves careful consideration. Reading this book, then, is less like engaging a sustained examination of the seventeenth-century Locke and Proast or even contemporary liberalism and more like having an extended conversation with an intelligent and engaging colleague, with John Locke and contemporary liberalism forming a persistent background. In the process, your understanding of both of these is sure to be advanced and challenged, but in an unsystematic manner that at times will prove frustrating. By contemporary intellectual standards, however, this is nonetheless an inviting opportunity.

Vernon's problems are largely self-imposed. Because he wants to use Locke's version of liberalism to do battle with other contemporary liberals, Vernon is forced to minimize the differences that separate the seventeenth and twentieth century. Thus, until the conclusion, he avoids drawing attention to the theological assumptions that undergird Locke's defense of toleration, and this necessarily detracts from the historical accuracy and value of his considerations. Conversely, his final willingness to recognize that Locke's position rests on critical theistic (if not Christian) foundations, along with the selective nature of his attacks on prominent liberal theorists, limits the power of his contemporary case. Surely, then, with a more coherent presentation, without the pretense of illuminating the actual seventeenth-century debate, and a fuller recognition of the difficulty of extracting a secular "Lockeanism" from its theistic or Christian foundations in John Locke, Vernon could have accomplished much more in advancing the case for a Lockean-derived liberalism.

Yet, there would still remain good reasons to follow Dunn in questioning how "useful" the historical Locke is to contemporary secular theorists. For example, what are we today to make of a theory of toleration that rests on theological grounds which even Locke would have been unable in his own day to defend on rational grounds, that is, if anyone had asked? Vernon fails to note that Locke's case for the

inviolability of each individual's religious conscience rests on Locke's belief that the only kind of adoration acceptable to God is devotion freely given and that, accordingly, each individual is responsible for negotiating his or her own salvation.

Indeed, so much of Locke's argument for toleration turns on his unorthodox Protestant beliefs about the nature of salvation, its centrality to a good human life, and what is needed for its achievement that it is hard to accept Vernon's claim that Locke's own views of rights and toleration can readily be extracted from their original Christian foundations. He concludes, nonetheless, by holding that "although [his Protestantism] clearly is the most basic fact about Locke, it is not, as far as his theory of toleration is concerned, ultimately essential to understanding what the theory entails" (p. 144). Thus, the essentially Protestant-inspired character of Locke's thought is finally recognized but neither explored nor found to be delimiting. But is not this to be expected? How else could Locke's teachings be made fully accessible to those who deny God's existence and normative ordering of the universe or, at the very least, do not share Locke's faith and confidence concerning what pleases God and what is necessary for salvation (*sola fide*) and eternal life at His side?

Vernon also consistently makes other assumptions, following Locke, regarding human nature and what is needed for human flourishing. Humans, at their essence, are decision makers, although imperfect ones. And as such, Vernon finds that much in Locke's selective Protestant perspective of the limitation on public or political morality should enjoy broad secular support. The private sphere, in light of Locke's and Vernon's view of human beings, is therefore to be much protected, and public life is to be greatly limited in its reach and aspirations. But what goes unconsidered is the possibility that human flourishing is best achieved in ways different from those Locke suggests. And just as Locke may be wrong about Christianity and God's predilections, he also may be wrong about the necessary private nature of moral activity. In short, a defining feature of community and public life goes unconsidered by Locke and, although having promised to do so, is similarly overlooked by Vernon. In an examination of only liberalism, one need not consider this alternative; but given that Vernon set out to compare the conservative thought of Proast to Locke's liberalism and to elucidate contemporary communitarianism, one rightly expects a fairer treatment of the communal side.

This promised two-sided debate never materialized and seems not, in truth, to be the essential goal of this book. More likely, Vernon wished to defend a version of liberalism based on certain guidelines discoverable in Locke against alternative forms of liberalism. And toward this goal, Vernon has made a most respectable beginning.

American Politics

Renewing Presidential Politics: Campaigns, Media, and the Public Interest. By Bruce Buchanan. Lanham, MD: Rowman & Littlefield, 1996. 209p. \$57.50 cloth, \$19.95 paper.

Emmett H. Buell, Jr., *Denison University*

This book derives from Buchanan's work with the John and Mary Markle Foundation on media coverage of presidential politics. It should appeal to critics of the often mean-spirited, dishonest, and vapid campaigns for the presidency waged in recent years, as well as those concerned about the power of

an increasingly judgmental press. Many of Buchanan's points ring true, especially those pertaining to the news media, but eventually even the most receptive reader will likely find the argument flawed and the proposed solution implausible.

The central problem of modern presidential campaigning, according to Buchanan, is that the candidates, their handlers, and the two major parties are driven by perverse incentives to regard voters as fools and to seek partisan advantage at the expense of resolving major problems of public policy. Rather than persuade likely voters with logic and facts, presidential campaigns manipulate them by caricaturing the opposition in unfair attacks, by appealing to prejudice and other base

emotions through demagoguery, by misrepresenting policy options or otherwise avoiding disclosure of their true positions, and by pandering to voters' worst instincts. Buchanan regard television as especially conducive to such tactics. This unrestrained competition harms the public interest by repelling independents and depressing turnout among the least informed and most apathetic. Buchanan clearly believes that contemporary campaigns delegitimize the electoral process for millions of potential voters and thereby corrode the foundations of American democracy. The news media only exacerbate these problems by fixating on the horse race at the expense of substantive coverage and by exaggerating the degree of conflict even beyond what already occurs.

These failings lead Buchanan to ask whether "good campaigns can somehow be made to happen, and bad campaigns be avoided, without the unpredictable assistance of galvanic personalities or economic crises" (p. 18). A campaign is "good" to the extent that it "repatriates the lower orders" and thereby heightens turnout to a level closer to that of other Western democracies (p. 30). Likewise, a good campaign induces voters to resist the standard tactics of manipulation, negativity, deception, and pandering. The more voters are motivated to inform themselves, Buchanan avows, the less they rely on Downsian shortcuts or simple schema to make up their mind. This also obliges the press to adjust its coverage accordingly. None of these improvements will occur, he maintains, if left to the unchecked instincts of candidates obsessed with winning or to the restraint of media organizations attentive only to process and conflict.

Having conceded in several places that we cannot abridge the freedom of the press to report the horse race, of candidates to campaign badly, of citizens to minimize their political obligations, and of voters to stay at home or employ shortcuts in deciding whom to support, Buchanan maintains that good campaigns will come about only when more voters regard themselves as "owners" of the electoral process rather than as spectators or passive participants. To initiate this transformation a "small cadre" of political independents must take charge. These elites should be "averse to negative partisan politics," exhibit sufficient stamina to keep up with the relevant facts, foster a spirit of national community, and set out clear standards for the media, candidates, and voters to follow (pp. 175-6).

Buchanan's proposed resolution seems unlikely to travel far beyond the foundation world, and his reliance on a civic-minded elite to empower the least active elements of the potential electorate is hardly the only inconsistency in this book. Another is his celebration of the 1992 presidential campaign as decidedly superior to that of 1988 because voters in 1992 focused on the economy rather than on such distractions as the flag salute and harbor pollution. Several chapters later, however, we learn that the content analysis of 1992 press coverage commissioned by his foundation showed that the media repeatedly misrepresented the state of the economy by not reporting clear signs of recovery. In other words, the media helped Clinton manipulate the basis for retrospective assessment of Bush's economic performance.

It is not too great an inferential leap to hold that 1992 really appealed to Buchanan because the Republicans dared not wage another Willie Horton campaign. Indeed, he treats all race-related issues as interchangeable with the symbolism of Willie Horton. Race, he maintains, should not be evoked even indirectly in a campaign if it crystallizes partisan support instead of evoking "some authentic exploration of future policy options" (p. 82). Later (p. 111) he argues that issues with racial "implications" should not be raised when

they exacerbate social tensions or divert attention from the "clearest and most useful conceptualization" of race relations.

Donning these shackles would virtually rule out the discussion of race in any form that offended any number of citizens. One wonders whether the public interest would be served by avoiding the most enduring question of American politics for the sake of not giving offense. Would that rule have served the public interest had it been somehow enforced in the 1950s and 1960s? Should it be followed today even though most Americans oppose racial preference in employment, college admissions, and awarding of government contracts? Is a clear standard like that set out in California's Proposition 209 to be dismissed because a minority deems it not useful?

For an argument based on the proposition that voters should not be treated as boobs, Buchanan either ignores or discounts a substantial literature on voting, especially retrospective voting, showing that voters, in V.O. Key's words, "are not fools." Only a footnote acknowledges that abstention may make sense for many voters, and even it is wholly innocent of Downsian rationality. Instead, we get a Cloward and Piven argument that low turnout is ipso facto bad and likely due to elite efforts to keep it low. The credibility of this claim is not well served by the fact that, in this age of postcard and motor-voter registration, we have just experienced the second lowest turnout of the century in a presidential election. A more balanced and comprehensive analysis would have better served Buchanan's case.

(Dis)Entitling the Poor: The Warren Court, Welfare Rights, and the American Political Tradition. By Elizabeth Bussiere. University Park: Pennsylvania State University Press, 1997. 222p. \$26.50.

Wayne D. Moore, *Virginia Tech*

According to the author, "the central argument of this book is that the Warren Court declined to 'constitutionalize' a right to welfare primarily because of the impact of legal doctrines" (pp. 157-8). More specifically, Elizabeth Bussiere claims that the Warren Court was boxed in by the "double standard" that it inherited from its predecessors, especially the Stone Court. The earlier Court's separation of "economic justice" from "individual rights" in connection with repudiating *Lochner*-era precedents and announcing a new interpretive framework in footnote 4 of *Carolene Product* (1938) purportedly "unleashed new and unforeseen problems for its successor, the Warren Court" (p. 121). Despite the justices' "liberal persuasion," efforts to establish "a constitutionally guaranteed right to welfare" were "doomed" (p. 116).

Much of the book, however, supports an opposing conclusion. Chapters on artisan republicanism and natural rights in Jacksonian America and on "maternalist" movements for pensions in the Progressive Era are designed, among other things, to rebut claims that the justices' denial of welfare rights was "an inevitable by-product of an inegalitarian market society" (p. 157). This line of reasoning depends on a premise that the Warren Court might have chosen a different course from the one it did, and Bussiere occasionally suggests as much. A chapter on the New Deal explores linkages between positive economic rights and constitutional guarantees, implicitly suggesting doctrinal bridges to alternative conceptualizations of welfare rights. A chapter on the Warren Court's "New Equal Protection" concludes that in the late 1960s AFDC mothers had "reasons for optimism" because "the Warren Court had shown itself to be hospitable to poor people's legal grievances" (p. 98). The two chapters

reviewing the Court's refusal to enforce a substantive constitutional "right to life" point toward viable alternatives to the majority's decision in *Dandridge v. Williams* (1970) and similar cases. The book's conclusion refers to general changes in "the political winds" during the 1970s that might have influenced the Court's decision (pp. 156–7). Bussiere suggests in closing, moreover, that "the language of maternalism might have served welfare recipients well," if only those advocating their cause had been willing to make such an appeal (p. 164).

Considering these internal tensions, and for reasons explained more fully below, the book's central causal claims strike this reviewer as overstated. *(Dis)Entitling the Poor* persuasively demonstrates that judges in the 1960s and 1970s were constrained by predominant norms of constitutional adjudication. It is not clear, however, that the Warren Court's refusal to enforce a substantive "right to life" was based primarily on doctrinal considerations.

In any event much of Bussiere's book is instructive independently of its primary causal claims. Self-consciously aligning itself with public law scholarship within the genre of the "new institutionalism," the book weaves together descriptive and normative analysis. Following a version of the methodological strategy suggested by Rogers M. Smith ("Political Jurisprudence, the 'New Institutionalism,' and the Future of Public Law," *APSR* 82 (March 1988):89–108), *(Dis)Entitling the Poor* deals with four main sets of issues. First, the book treats patterns of judicial reasoning as "structures" or "institutions" that independently affect political choices. Second, it places current practices within historical context. Third, Bussiere's interpretive narrative focuses on a selection of judicial decisions that she treats as exemplary. Fourth, she explores ways that judicial decisions shaped constitutional doctrines, which in turn constrained further deliberations. (Cf. Smith 1988, 101–3.)

Viewed in relation to these objectives, Bussiere's book is both ambitious and thoughtful. It contains solid scholarship and contributes substantially to the existing literature on welfare rights. More generally, this work informs analysis of relationships between patterns of constitutional rhetoric and judicial decision making.

But the book's contribution to understanding the constitutional politics of welfare rights falls short in at least two significant respects. First, Bussiere does not adequately explore the plausibility of alternative decisions in the 1970s or since then. This omission is especially troublesome because the initial chapters lay the groundwork for critical analysis of this sort. More generally, Bussiere leaves largely unexamined the ways that earlier conceptions of welfare rights call into question her equation of constitutional meanings with the Constitution's *judicial* interpretation and enforcement. Again, this omission is peculiar because the materials she uses to exemplify conceptions of welfare rights based on arguments from natural rights, republicanism, and maternalist perspectives direct attention primarily to how rights of the poor may be secured through *legislation*.

For a book that depends so heavily on claims that constitutional doctrine has been politically determinative, the analysis of judicial interpretive precedents is disappointing. For example, Bussiere characterizes the logic of footnote 4 of *Carolene Products* as committing the justices to scrutinize procedural fairness in the making of laws. Although the footnote has received important proceduralist glosses, it is not clear that the footnote as a whole—and especially its first and third paragraphs—is concerned only (or even primarily) with lawmaking procedures. More important, Bussiere does not adequately account for judicial decisions since the New

Deal—most notably *Roe v. Wade* (1973)—that are difficult to square with various conceptions of the famous *Carolene* footnote and its underlying principles or with a general commitment to "proceduralism." Exploring this type of issue would lead, among other things, to questions about why the judges sought to guard some substantive constitutional liberties but not others, including the kinds of welfare rights of concern to Bussiere. How were the doctrinal hurdles overcome in some cases but not others?

These issues might be approached, alternatively, through a more thorough examination of dissenting arguments or scholarly literature advocating a greater role for judges guarding welfare rights. If judicial doctrine was so confining, how could such arguments be maintained coherently? Or have these out-of-favor arguments been fundamentally misconceived? (Cf. Mark Graber, "The Clintonification of American Law: Abortion, Welfare and Liberal Constitutional Theory," *Ohio State Law Journal* 58(October 1997):731–818.)

Bussiere also misses opportunities to explore problems of institutional capacity. The book (p. 150) quotes Justice Potter Stewart's comment in *Dandridge v. Williams* (p. 487) that "intractable economic, social, and even philosophical problems presented by public welfare assistance programs are not the business of *this Court*" (emphasis added). Stewart did not deny that welfare rights are properly the business of *other government officials*. On a related matter, Bussiere claims that "the Roosevelt Court's thoroughgoing repudiation of natural-law reasoning rendered a 'natural' right to subsistence very flimsy as a matter of constitutional interpretation" (p. 149). Neither President Franklin Roosevelt nor the justices denied, however, that legislative and executive officials could play important roles in securing constitutional rights, including those conceived as "natural" in character. On the contrary, much of the president's case for the New Deal, as summarized in chapter 4 of *(Dis)Entitling the Poor*, may readily be understood as resting on "naturalist" reasoning. Roosevelt's argument that rights of the poor should be secured through legislation, moreover, echoed earlier workingmen's and maternalist arguments for *legislative* solutions to problems of economic inequity. In this respect the New Deal precedents complement rather than contradict Bussiere's examples from the Jacksonian and Progressive eras.

The Warren Court's refusal to articulate and enforce a sweeping constitutional right to subsistence was doubtless politically significant. As Susan E. Lawrence (*The Poor in Court*, 1990) has pointed out, however, decisions like *Dandridge v. Williams* have not preempted innovations by the legislative and executive branches for the benefit of the poor. R. Shep Melnick (*Between the Lines*, 1994) has emphasized, moreover, ways that public support for welfare rights has been greater for programs supported by the more electorally accountable branches than for those announced by judicial fiat. He has also suggested ways that legislation securing welfare rights implicates fundamental problems of constitutional meaning and structure. Bussiere has done the field of constitutional studies a service by casting additional light on these issues and underscoring their importance.

Cheap Seats: The Democratic Party's Advantage in U.S. House Elections. By James E. Campbell. Columbus: Ohio State University Press, 1996. 336p. \$60.00 cloth, \$22.00 paper.

Mark E. Rush, *Washington and Lee University*

This is unquestionably a book that any scholar of American politics and, perhaps, electoral systems more generally ought

to read. It presents clear evidence that the Democratic Party has benefited from recurring advantages produced by the single-member district system of elections. *Cheap Seats* is clearly written and presents equally clear, straightforward data analysis that is accessible to even the less quantitatively oriented student of politics. That having been said, this reviewer must take issue with some of Campbell's conclusions and analysis. Campbell's data do not lie, but I do not see that his conclusions follow clearly from his analysis.

Campbell seeks to analyze why the Democrats managed to dominate congressional elections from 1954 to 1992. He attributes this to their control of "cheap seats," that is, those in which turnout is quite low and, therefore, candidates need to garner fewer votes for victory. Throughout, he carefully presents evidence and constructs an argument showing that Democrats do, indeed, benefit from their control of a disproportionate number of cheap seats. Perhaps the most damning evidence he presents is in Table 5.2, where he shows that aggregate turnout in Maine's two congressional districts was higher than that of seven districts in New York—all of which were held by Democrats.

Even when one takes into account the swing ratio, the Democrats' control of the overwhelming majority of these cheap seats actually amplified their margin of control in the House, even in years when they did not do as well among voters. The question that this begs, of course, is what we should do about all this. Despite Campbell's suggestions, one is left believing that—short of dispensing with single-member districts—precious little can be done to alter the turnout patterns he observes.

Campbell shows that there is a high correlation between victorious Democrats and low-turnout congressional districts. Evidence has shown, however, that increasing turnout in those districts would have an effect on their electoral outcomes (e.g., Wolfinger and Rosenstone, *Who Votes?* 1980). As well, while evidence suggests that the presence of a challenger in such low-turnout (and frequently uncontested) districts might increase turnout and significantly alter the partisan balance of the district's electoral outcome, it does not indicate that this would make that outcome any more doubtful (Rush, *Does Redistricting Make a Difference?* 1993).

Campbell himself acknowledges that the Democrats' propensity to hold cheap seats is due in significant part to socioeconomic factors: poorer, less educated voters tend to vote democratic (p. 142). As well, he points out that gerrymandering plays little role in delivering cheap seats to the Democrats because such voters tend to be concentrated into discrete geographic areas. So, as long as we draw legislative districts on the basis of equality of population, some of those districts are inevitably going to have lower turnouts (and correspondingly stronger pro-Democratic biases) than others.

At first, Campbell's analysis is quite alarming—especially when he presents data such as that comparing Maine and New York or, for example, when he shows that there was almost an 8:1 difference between districts with the highest and lowest turnout in 1992. Clearly, candidates who need to win a district in which only 50,000 votes are cast have it much easier than those who must win in districts in which 300,000 residents vote.

Yet, while there is no disputing Campbell's evidence, his conclusions need further qualification. Noticeably absent from Campbell's analysis is any discussion of campaign spending. Perhaps the roughly 70,000 voters who turn out in a Queens congressional district are a lot harder to get out in the first place than the 250,000 who flock to the polls in a Maine district. In other words, while there may be fewer

votes cast, competition for them may be no less fierce. If victory in Queens requires spending sums comparable to what is spent in Maine, then the thrust of Campbell's analysis could be reversed: The candidate in Queens gets much less "bang for the buck" than one in Maine. A quick look at Federal Election Commission data for the 1996 congressional election offers no conclusion about this, at least for the Maine and New York districts. Nonetheless, any conclusions about the "cheapness" of a congressional seat would seem to call for an analysis of spending patterns as well.

Differential rates of turnout are thus the core of Campbell's analysis. He shows that this has resulted in a skewing of the partisan flavor of the House because the Democrats' margin of seats in the House clearly was larger than their electoral margin would have suggested. As well, he points out that this same cheap seat phenomenon dampened the swing ratio's effect and actually diminished the Republican electoral fortunes in 1994. The same number of votes for the Democrats would have produced a significantly larger seat majority.

Campbell makes four suggestions to resolve the problems he sees in the electoral system. (1) We can change the way we allot population among districts, perhaps apportioning on the basis of voting age population or population eligible to vote. (2) We can draw fewer districts—by either converting to multimember districts or decreasing the size of the House—in order to minimize the interdistrict turnout disparity. (3) We can have a turnout-sensitive strategy of reapportionment. (4) We can seek to increase turnout.

Surprisingly, Campbell does not call for an outright conversion to proportional representation. This certainly would alleviate the effect of turnout discrepancies as well as the problems of bias and responsiveness that he notes in his swing-ratio analysis. Furthermore, it obviously would resolve many of the ongoing gerrymandering disputes that arise in a district-based system.

Clearly, reapportioning voters on the basis of voting age population may help alleviate some of the turnout disparities among districts. A turnout-sensitive reapportionment policy, however, would be difficult if not impossible to implement for obvious reasons, despite his evidence (p. 213) that district turnout is fairly constant from one year to the next. Add or subtract a challenger or retire an incumbent, and turnout may change significantly. Finally, *decreasing* the size of the House hardly seems practicable. While it might alleviate interdistrict turnout disparities, it would certainly make the process of drawing district lines even more contentious than it already is.

In sum, while one can take issue with his prescriptions, Campbell does provide a clear diagnosis that *something* is wrong with the electoral system. There is a price to be paid if we are to retain the single-member system of elections and insist that the right to vote requires equipopulous voting districts. Campbell has offered yet another reason to question whether the price is worth it.

Roosevelt's Warrior: Harold L. Ickes and the New Deal. By Jeanne Nienaber Clarke. Baltimore, MD: Johns Hopkins University Press. 1996. 414p. \$67.00.

Matthew J. Dickinson, *Harvard University*

Jeanne Nienaber Clarke's biography of Harold L. Ickes focuses primarily on 1933–39, when he served not only as Franklin Delano Roosevelt's Secretary of the Interior but also as director of the Public Works Administration (PWA) and as oil production "czar" charged with ameliorating the

boom-and-bust tendencies of the industry. For the most part, the book's strength is not in any new historical material uncovered or any new interpretations offered; much of what Clarke recounts has been covered before in previous biographies of Ickes, by his posthumously published and sanitized "secret" diaries, and the voluminous New Deal historical corpus more generally. Instead, it lies in the literate way in which she assimilates and presents a large body of material about an important and exceedingly complex New Deal figure.

To the less historically minded among us, of course, Ickes is perhaps better known of late as the father of Harold M. Ickes, President Clinton's former White House deputy chief of staff and senior campaign strategist. It turns out that the characteristics Clarke attributes to the father—a devotion to liberal causes, a combative temperament, and extreme loyalty to the incumbent Democratic president—characterize the son as well. Yet, their career paths, as I discuss below, greatly diverge. Conceivably, Clarke could have used this father-son link to address some of the changes in presidential politics in the intervening decades. Instead, the book says almost nothing about the younger Ickes or of presidential politics today.

In Clarke's defense, the contribution of the senior Ickes to FDR's presidency and the New Deal more generally is a story worth telling in its own right. Ickes was a life-long Progressive who played an influential role in a variety of critical policy areas, including civil rights (he moved to desegregate the Department of the Interior even as FDR, fearful of losing the support of the southern wing of the Democratic party, largely avoided the race issue), natural resource conservation (Ickes vastly expanded the acreage of the national park system), and foreign policy (Ickes was an early and vocal advocate for U.S. intervention in Europe and the Far East, and he worked determinedly to block Japanese and German access to U.S. natural resources).

Moreover, "Honest" Harold had a well-deserved reputation for integrity, at least in his public affairs; he largely avoided even the whiff of fiscal scandal while sponsoring as PWA director millions of dollars in large-scale capital projects, ranging from dams and bridges to parks and public housing, and working in his capacity as oil administrator to adjudicate disputes in the oil industry.

His public reputation, however, belied a rather sordid personal life, as Clarke makes quite clear. For the most part, except for a brief lapse into psychoanalysis near the end of the book, her coverage of Ickes's private affairs is straightforward and largely nonjudgmental. This even-handedness is facilitated by her judicious use of his unpublished memoirs and unedited diaries, which allow Ickes to speak for himself. These personal glimpses provide a darker twist to the label "curmudgeon" that Ickes rather pridefully bestowed upon himself in *The Autobiography of a Curmudgeon* (1943).

His first marriage was a troubled one, punctuated near its end by affairs with other women. These affairs included, evidently, a brief liaison with his wife's daughter from a previous marriage and, later, a lengthy relationship with a married woman, begun during the delicate political period in which he was taking over the Department of the Interior in 1933. He was evidently more relieved than remorseful when his wife, who had earlier attempted suicide, died in a horrific automobile accident in 1935. Nor did he appear particularly guilt ridden over her inexplicable decision to leave everything to him (if it was *her* decision—Clarke's accounts hints at Ickes's possible duplicity here); he made no effort to share this inheritance with any of her children, and his stinginess may have contributed to the suicide of one of her sons. His second wife, Jane Dahlman, whom Ickes married in

1938, was almost 40 years his junior. By all accounts it was a happy union, but the age disparity provided more fodder for his critics, including Cissy Patterson, an influential member of a publishing family who publicly turned against Ickes in her editorials after he broke off their relationship to marry Dahlman.

Ickes had two children by his second marriage, including Harold M. Ickes, Clinton's White House aide. Despite their shared temperaments and political ideologies, the two Ickes's respective careers took largely separate paths, due primarily to changes in presidential politics during the intervening 60 years. As noted above, Clarke is not particularly concerned with chronicling those changes, but the contrast between the two careers, and the context in which they unfold, are in fact quite instructive. Three developments in particular stand out: the eclipse of the presidential cabinet by the White House staff as the primary source of presidential advice and administrative support; the dramatic drop in public support for a large, activist national government; and the gradual blurring of the distinction between politicians' private and public lives.

Consider the erosion of the demarcation between public and private activities during the last six decades. It is doubtful that Harold L. would have survived more than four years in office under Clinton, much less the fourteen he served under FDR. Harold M., of course, served less than a term in Clinton's White House, his fall from political grace precipitated in part by intense political scrutiny of some ethically questionable activities, most notably possible campaign-related fundraising illegalities. But, as Clarke makes clear, the personal activities of Harold L. occasionally spilled over into the public realm as well, as when he placed a woman with whom he was having an affair on the payroll at Interior. For the most part, his public reputation remained unscathed by his private controversies, but given today's in-depth media scrutiny of politicians' private lives, one wonders whether FDR would have tolerated those questionable personal activities to the degree that he did.

A second change in presidential politics is the eclipse in political influence of the president's cabinet by the White House staff. The elder Ickes wielded influence by virtue of his position as Secretary of the Interior. This guaranteed him the president's ear; no White House aide dared obstruct his access to FDR or attempted to make him a lackey of the White House staff. Today, despite the media stories at the start of every presidential term concerning the importance of presidential cabinet choices, real power resides in the West Wing, among the White House staff. Indeed, Harold M.'s influence came not from any executive function but from his position as a senior member of Clinton's personal staff.

This decline of cabinet prestige may have hurt presidents politically. Ickes, by virtue of his political prominence, served FDR ably as both stalking horse and political lightning rod; he could advocate policies, such as racial integration in public facilities, that FDR privately supported but could not, for political reasons, publicly embrace. But to perform these functions credibly, Ickes had to be viewed as somewhat independent of FDR, rather than as simply his mouthpiece. For this reason, FDR gave Ickes extensive freedom to run Interior as he saw fit. Most of FDR's successors, however, have failed to appreciate the benefits that can accrue from having secretaries with independent bases of power.

The third change apparent from Clarke's work is the erosion of political support for "big" government. Ickes believed that, in the hands of the Democratic Party, government could be an instrument to protect the public from the worst excesses of unbridled capitalism. Today, of course, Clinton has refashioned the Democratic Party in the Repub-

lican mold, in the process moving it away from the Progressive policies Ickes embraced. Such Republican me-tooism has helped Clinton win reelection and retain popularity, but it also contributed to Harold M.'s departure from the White House, a decision that one can imagine the senior Ickes would have supported.

Although Clarke largely eschews these types of comparisons, in her concluding chapter she tries to place Ickes in some historical context and come to grips with both his public and private persona. Her rendering suggests a much more complicated figure than the historical caricature of him as Progressive-cum-curmudgeon would suggest. Despite his questionable personal ethics, he was a man of unbending political principles who was not afraid to take on controversial issues. One cannot help but wonder if politics today precludes the selection of public officials who possess such strength of political convictions and the willingness to act on them.

Party Decline in America: Policy, Politics, and the Fiscal State. By John J. Coleman. Princeton, NJ: Princeton University Press, 1996. 253p. \$39.95.

Political Parties and the Maintenance of Liberal Democracy. By Kelly D. Patterson. New York: Columbia University Press, 1996. 189p. \$45.00 cloth, \$16.50 paper.

William Crotty, *Northeastern University*

The Coleman and Patterson books are alike in that both approach an explanation of political party performance from distinctive policy perspectives, employing these to develop innovative and broadly inclusive explanations of party performance in the United States. Both also explore patterns of party behavior over time, and both focus primarily on the same historical period (post-World War II America). And both deal in broad if different terms with "party decline" theses, offering explanations for party continuity and change and assessing in varying forms the parties' contributions to representation in a democratic state. Both, in addition, are broadly ambitious works—in conception, execution, and the importance of the questions asked. Beyond these similarities, the two books diverge significantly in approach and argument.

The Coleman work, the more thematically comprehensive of the two, has theoretical assumptions and emphases less familiar to parties' scholars. Coleman approaches parties from a "state-centered," political economy perspective. It is one that has received more attention in the political development literature, and this study can be considered an example of the approach.

Party Decline is not an easy book to read or to synthesize, and it is not as thematically clear in presenting its major lines of argumentation as one might wish. The study incorporates an abundance of various types of data and secondary analyses, assessments of previous and related studies, and reinterpretations of other work and historical explanations in advancing its points. Basically, Coleman contends that the dominant policy concerns of a given period and the state-determined institutions for resolving these predict, and in fact predetermine, the relevance of the parties' role in governance. The parties' importance in representing voters, providing viable policy alternatives, and shaping contrasting legislative programs depends on the central issues confronting the state. Parties thus can be more or less relevant in different policy eras depending primarily on the economic demands the nation is experiencing.

Coleman develops his basic thesis in a multilayered series

of explanations. The contention is that from the late nineteenth century to the inception of the New Deal, the state was in a process of expansion, a point not in debate. During these decades, Coleman argues, trade policy dominated political discourse, and the major parties offered distinctive visions and policy alternatives of substance. These positions held meaning for their clientele groups and for candidates for public office, and they had consequences for the development of state responsibilities.

This all changed during the 1930s with the self-conscious deemphasizing of the parties' effect on government and a distancing of the parties from relevant policymaking concerns. During this period and proceeding up to the 1990s, macroeconomic policy took precedence on the country's political agenda, a category of issues that the parties found difficult (if not impossible) to encapsulate in campaigns and over which mass electorates could exercise little control. Consequently, the political parties declined in significance during more recent decades.

The expansion and operations of the state from the 1940s on, the manner in which the political parties responded in both the Congress and in mobilizing electorates, and the congruence on fiscal policy in times of crisis and recession all combined to decrease the parties' centrality to decision making and the perception of their relevance by voters and political and economic elites. "In the end, the constraints of the fiscal state left the parties looking less relevant. With deference to the president, comparatively little to say on monetary policy, the acceptance of 'automatic' policy, and consensus over the response to economic problems, the parties failed to convince a growing portion of the public that they deserved attention or support" (pp. 138–9).

As for the present and the future, Coleman suggests political institutions can change and with them the parties' effectiveness. The "possibilities for party in American politics look better in the mid-1990s than they have since the establishment of the fiscal state" (p. 206). But, and this is the fundamental message, "no inherent logic of history requires party collapse and no such law demands renewal or ensures that parties will follow the pattern or path that is best for democracy or the parties' long-term relevance" (p. 207). Decisions now being made as to the direction state-economic relations will take in the future will provide the context for party operations and the breadth and quality of their contributions to democratic representation.

Again, *Party Decline* is an ambitious study and a bold argument. The use of data and the argumentation are rich and layered. State-based and macro-policy emphases are not new to explanations of party relevance—Walter Dean Burnham, Thomas Ferguson, and Martin Shefter, among others, have been developing variations of the approach for years. The limited concentration on one set of policy imperatives, and the state's response to these, and the promotion of the idea that the political parties are creatures dependent primarily on the dominant policy concerns of the state are difficult to accept as definitive explanations for their behavior. Parties can be captured by elites and economic interests (although this is not what Coleman is contending), and they do deal, with varying degrees of conviction, with the important issues of the day. These factors are valid, if partial, explanations for their actions. Political parties serve a variety of social and political needs within a society.

The approach obviously has significant utility for enriching our appreciation of party and state interaction, and the focus on policy issues is welcome. These dimensions of party operations are ignored or more often deemphasized in more conventional studies. Enlarging the context for exploring

party behavior is a contribution. Less convincing are single-factor explanations for broad patterns of behavior that respond to a variety of social impulses. These seem more delimiting and deterministic than is necessary. American politics is more open, pluralistic, and complex than single-theme, economically derived explanations would allow.

Political Parties takes a different tack. Patterson examines the linkages among the nomination, electoral, and governing coalitions as found in the commitments made at each stage of the policymaking process, seen here as a more bottom-up (as contrasted with Coleman's top-down) operation. In examining the period 1952–92, Patterson contrasts “the policy positions of presidential candidates . . . to the position outlined in party platforms and to those of party leaders in the Congress. Comparing party platforms to positions taken by candidates is one method of probing the connection between the nominating coalition and the electoral coalition . . . comparing the policy positions of the presidential candidates to the publicly stated positions of both parties’ congressional leaders yields considerable evidence about the relationship between presidential candidates’ electoral coalition and other vital components of the governing coalition” (pp. xxi–xxii).

The basic relevance of Patterson's study hinges on the acceptance of these linkages as critical to party performance and effect and the adequacy of the indicators of policy commitments—platforms, campaign rhetoric, and the positioning of legislative leaders—as the key associations and best representations of coalitional preferences. Patterson uses these measures, for example, to explore a concern with the quality of democratic representation, which is seen as the product of electoral competition, endorsed or redirected in accordance with election outcomes.

The tenor of Patterson's research is more explicitly empirical and the conceptualization and use of time frames significantly different than in Coleman's work. Policy formation is tied through successive party leaders and coalitional commitments more directly to the politically active concerns of the public. There is a conception of accountability in this and an assumption that the actions of government are largely determined by the results of elections and the priorities of the winning coalition.

Patterson is also more explicitly concerned with examining the arguments as to the decline of the parties and their implications. While accepting the belief that the contemporary parties are less effective and successful than they might have been in the past, it is Patterson's contention that the linkages examined have not eroded significantly and that as a consequence the parties remain, through these interrelationship, viable contributors to the process of democratic representation. The message is that the linkages among coalitions remain strong and cohesive at the same time that the broader parties and their operations have fallen into disrepute.

Consistent with the approach taken, Patterson reviews four decades of presidential campaigns and includes a range of proposals in the analysis: in effect, all issues of prominence at the various stages designated as significant to the campaign and to coalitional relationships. The study finds a stability over time in party positions and, for example, little difference in cohesiveness or divisiveness between primary and general election coalitions in the pre- and postreform eras. Patterson argues that the electoral landscape has been transformed since 1952 to the extent that “the conduct of campaigns today bears little or no resemblance” to those of earlier decades, “yet the relative stability of the levels of agreement between candidates and platforms attests to the strength of the links

between the nominating coalitions and the party apparatus” (pp. 58–9).

The research also shows an increase in emphasis on redistributive policies, taken as an indication that the parties are not as weak or their ideological base as non-differentiating or bloodless as the party decline literature might lead one to expect. Employing the measures developed, a comparison of rates of agreement and disagreement over policy implementation among party elites finds “that possibilities for governance have not been seriously compromised” by changes that have taken place in party decision-making structures or, more broadly, the political environment (p. 107). The conclusion follows that “the ballyhooed crisis of government accompanying the decline of political parties in the United States seems not to have occurred” (p. 117); “the American version of democracy is humming right along” (p. 119).

There are a number of surprises along the way. In 1968, Hubert Humphrey, judged by the number of issues put forward (and not the adequacy, clarity, or effect of the proposals), placed a greater emphasis on “law and order” appeals than did his opponent, Richard Nixon, who built much of his campaign on this theme. A number of indicators showed less intraparty conflict among Democrats than Republicans, and the ultimate reformer and ultraliberal, George McGovern, had more in common with traditional Democratic Party values in 1972 than the rhetoric of the times would suggest.

In sum, then, the two studies in actuality are quite different. Both deal primarily with the same period, and both use a policy-driven perspective—approached in dissimilar and unrelated manners—as the point of departure for assessing the adequacy of the political parties as factors of consequence in democratic policymaking. Overall, though, the conceptual designs, the data sources and the way in which they are incorporated into the analysis, the assumptions underlying the research strategies, and the conclusions reached have little in common. Each study makes its individual statement; each represents a serious effort to address fundamental questions of representation; and each is comprehensive, thoughtful, and provocative enough to invite a revisiting of the events of the last half century and their meaning for understanding why political parties survive as well as the forces that define their contributions.

Bureaucracy and Self-Government: Reconsidering the Role of Public Administration in American Politics. By Brian J. Cook. Baltimore, MD: Johns Hopkins University Press, 1996. 201p. \$45.00 cloth, \$14.95 paper.

Richard T. Green, *University of Wyoming*

Brian Cook offers readers in public administration and political science an important new work on the problem of reconciling bureaucracy with democracy. In *Bureaucracy and Self-Government*, he addresses historically the American penchant for treating the public administration as a mere instrument of public will. Cook argues that our emphasis on absolute instrumentalism in public rhetoric has led to increasing disregard for the “constitutive” dimension of the public administration. Disregard for this dimension, he believes, has led to a strained politics of manipulation by the contending branches of government in order to make the public bureaucracy do their bidding. This has resulted in abuse to public agency capacities for serving vital democratic functions.

The constitutive dimensions of the public administration

involves its formative effect upon both the public policy. The myriad institutions of the public administration help define the ways in which we interact socially as well as politically and help us to deliberate upon and determine the proper ends and means of public policy. They create a multitude of ties between the people and the superintending branches, wherein they are ideally situated to exert educative, restraining, and stabilizing influence in both directions.

This latter role is rooted in the Greek conception of "practical reason." This is a form of wisdom that emphasizes relating the ideal to the real, and it can be gained only through the combination of education and tempering experience. Public agencies provide fertile ground for cultivating practical wisdom in service to democratic governance because they routinely bring policy to the street and represent constituencies to the superintending branches. They are suited to fostering ongoing discussion of ends and means among citizens and public officials and to articulating realistic capabilities for bringing appropriate ends and means to fruition. In short, the public administration helps constitute public spaces wherein citizenry may interact meaningfully with their government. Together they can give accountable form to public opinion.

Supporting this constitutive dimension is problematic, however, because our democratic spirit leads many to challenge the idea that anything other than the people and their directly elected representatives should define our way of life. Cook confronts this challenge by examining the prudent correctives underlying our constitutional system. The founders designed that system to bring restraint and stability to both the people and their government for the sake of protecting individual rights and preserving the republican form of government for posterity.

In the course of the founding debates on how to ensure these things, the role of the public administration received far more attention than most popular and scholarly works admit today. Cook's historical research reveals that the founders recognized the constitutive dimension as essential to the role public administration would play in a system of shared, checked, and balanced powers. They feared a purely instrumental view of subordinate officials would lead to tyranny by one branch or another. In essence, Cook concludes that all three branches were viewed as forming the superstructure of the public administration, and that the public administration should play a vital role in winning the allegiance of the people to the new republic.

Despite this important conclusion, however, Cook explains that, on the whole, the public rhetoric of the founders focused more upon the instrumental conception than the constitutive. In short, they played to the democratic spirit of the people with overly simplistic but compelling images of what popular government would be like, in order to secure ratification.

The instrumental image then manifested itself in some key decisions of the first Congress. The famous "decision of 1789" is particularly important. Congress determined that the president should have, by statute, the sole power to remove the secretary of foreign affairs (now our secretary of state). Although the congressional debate over this issue reflected sophisticated appreciation for the constitutive dimension of the public administration, the final decision clearly favored the instrumental view. Moreover, that decision, perhaps more than any other, institutionalized the instrumental view for posterity. From that point on, most of our politicians, judges, and administrators have viewed the president as holding sole power of removal over *all* principal officers of public administration. That has reinforced the instrumental

image of the subordinate public administration and has set in motion a series of increasingly strained political battles among the branches of government for instrumental control over the bureaucracy.

Cook devotes much of his book (chaps. 2–5) to tightly written and fascinating analyses of these battles in the Founding, Jacksonian, Progressive Reform, New Deal, and post-New Deal eras. He shows how politicians adopted increasingly disingenuous and expedient political tactics that pinned blame for failures upon the other branches and ultimately upon the most convenient target—the subordinate bureaucracy. Thus, ironically, a strictly instrumentalist view of public administration leads inevitably to the public impression that government is an illegitimate bungler. These chapters stand on their own as valuable historical accounts for politicians and public administrators alike, for they explain much about how their relationships evolved to the current day. They should be required reading for all high public officials (elected and administrative) as well as for all students of government.

Cook's remaining chapters (6–7) briefly outline how we might recover a constitutive view of the public administration. He concedes that the task is daunting, and his suggestions may therefore seem somewhat benign and even "Pollyannaish" (p. 170). Nevertheless, he presents a thought-provoking analysis.

He argues that a vital first step "must be a broad-based, concerted effort to fashion a constitutional theory of public administration for the American regime" (p. 179). Toward this end he examines some important theoretical work by authors such as Stephen Elkins, Martha Derthick, Theodore Lowi, and John Rohr. Each provides important insights on the problems of discretionary administration in democratic societies. In the end, Cook concludes that Lowi's conception of juridical democracy (in *The End of Liberalism*, 1979) and Rohr's theory of public administration (in *To Run a Constitution*, 1986) provide a good starting point for broader public discussion of an appropriate constitutional theory. Lowi's rule formalism puts the principle of rule of law center stage, and Rohr's theory puts the discretion-conferring oath to uphold the Constitution squarely upon the public administration as a balance wheel of the system. Cook notes that each approach presents weaknesses, but in combination they provide the insights needed to help restore a healthy balance between the instrumental and constitutive dimensions of governance.

Finally, Cook hopes that opportunities for recovering constitutive administration exist in the current period of political flux and reassessment. He admits doubt about this, however, because most political and administrative reformers seem devoted to purely instrumental and cynical conceptions of the bureaucracy. Beyond this, he argues, we should engage in an educational program that brings awareness of the constitutive dimension to the public and their officials at all levels. Doing so, Cook believes, will lead eventually to a more appreciative and involved public.

How we do this remains problematic. Cook's suggestions here are weak, and he admits it. He hopes that additional works as influential as Lowi's *End of Liberalism* may emerge to boost political reflection. He also hopes for a rejuvenation of classical political science that emphasized the inculcation of practical wisdom. I agree that this would help, but I see no indication at all that the discipline of political science is headed in that direction. Public administration programs more often languish than prosper in the current disciplinary environment. A classical political science will probably have to emerge from some other source.

Though Cook ends his book on slim hopes, the work overall represents a valuable addition to the literature on bureaucratic discretion in our democratic system. It should certainly become mandatory reading in public administration programs and political science departments and, it is hoped, among public officials as well. I profited greatly from it and expect that all those who read it will share similar convictions.

Home Team: Professional Sports and the American Metropolis. By Michael N. Danielson. Princeton, NJ: Princeton University Press, 1997. 397p. \$29.95.

Charles C. Euchner, *Boston Redevelopment Authority*

For almost two decades, cities in North America have confronted a problem that seems like a unique crisis but in fact is part of a pervasive trend in modern sports: A professional franchise threatens to move to another location if it does not receive hundreds of millions of dollars in benefits from public authorities. The challenge seems unique because of the emotional stake that local political elites, downtown businesses, boosters, and fans have in the team. What invariably ensues is a protracted negotiation in which the team holds most of the cards, and public authorities can only react and improvise. The result is an ongoing public subsidization of a booming industry.

Michael Danielson has produced the most thorough and evenhanded analysis yet of the politics of sports and cities. He focuses on the way that sports teams foster and exploit a sense of "place," particularly in cities where dynamic economic growth or decline undermines a more organic and abiding civic identity. Danielson carefully analyzes the operations of the major sports leagues in baseball, football, basketball, and hockey and the way they interact with state and local governments, on issues such as stadiums and expansion, and other industries with a major stake in sports (like television, movies and amusement parks, the fast-food industry, breweries, and newspapers). He pays special attention to the not-so-inevitable changes in sports over the last century and highlights decisions that have significantly shifted the course of sports-city relationships. Ultimately, Danielson concludes that the narrow business interests of team owners trump all other factors. He quotes the late Robert Irsay, who in the dark of night moved the Baltimore Colts to Indianapolis in 1984: "This is my team. I own it, and I'll do whatever I want with it" (p. 67).

At the center of the dynamic of sports-city politics is the monopolistic character of leagues. This monopolism operates at many levels. First, the major sports leagues deliberately restrict the supply of teams at the same time they encourage more and more cities to enter the bidding for teams. Second, once teams are in the leagues, they enjoy almost total control over their geographic territory. Third, the leagues dominate access to broadcasting revenues; if you cannot get on TV, then you cannot be viable in major league sports. Fourth, the leagues enter into labor agreements that are a kind of Faustian bargain: In exchange for control over labor against potential rival leagues, the leagues pay exorbitant player salaries. Fifth, team owners reinforce their control over sports (and manipulate their tax liabilities) by combining far-flung businesses from TV to restaurants and beer and liquor companies.

The leagues' extraordinary control over all aspects of sports politics is often obscured by the emotionalism and symbolism unleashed when a local authority proposes to build a new stadium and the team owner threatens to move to another city. The political is personal when it comes to

battles over local sports teams; figures like Al Davis, Robert Irsay, George Steinbrenner, Ted Turner, Wayne Huizenga, and Jerry Reinsdorf take center stage, and the more important systemic forces get shunted to the side in local debates.

Even to people who have followed the business of sports for years, the financial dimension of sports politics is stunning. As Danielson notes, public authorities give franchises new stadiums at little or no rent, practice facilities, guaranteed revenues from ticket sales or broadcasting deals, free or subsidized land, a range of development opportunities, tax breaks, and a host of expensive infrastructure improvements, not to mention outright grants, worth tens of millions of dollars. As the gap between the supply and demand for teams grows, the cost rises dramatically. As recently as 1984, a brand new domed stadium in Minneapolis cost taxpayers \$60 million—a lot of money, to be sure, but not a budget buster. As the century ends, the owner of one of the richest teams in sports, the New York Yankees, is demanding a facility that could cost as much as \$1.2 billion.

As Danielson notes, the economic arguments for such largesse—that teams bring millions in new spending to the city, which then multiplies in the local economy—are flawed. So why does this expensive game continue? The usual answer is that fans/voters would raise Cain if a mayor let a team move. But this argument is belied by the lack of electoral punishment to mayors who presided over team transfers and by numerous voter rejections of stadium deals. The real answer lies in the sports industry's monopolism, which gives teams decisive leverage in their dealings with urban officials. The one-shot patronage of new stadiums for well-connected urban elites (e.g., banks, unions, developers) and the incessant boosterism of newspapers and other sports supporters also helps the franchise's cause.

The usual public policy proposals to confront professional sports include government regulation, forcing leagues to expand, encouraging rival leagues, and fostering cooperative arrangements that bind teams to cities. But never do policymakers consider attacking the heart of the problem, namely, the leagues' monopolistic control. Danielson does not explore a number of ways that restructuring of leagues could change the balance of power in sports politics. Such restructuring might include overturning league rules about public ownership, territorial exclusivity, player sales, minor league development, and the relationships between the big leagues and the minor leagues and collegiate sports associations. The boldest move would be to break up the big leagues, *Ma Bell* style.

Danielson's greatest virtue is also his biggest shortcoming. His study offers the most careful, detailed, thorough, and even-tempered study of the sports business in a burgeoning academic and journalistic literature. But he often fails to connect the dots and boldly highlight the underlying forces that drive the whole process. Still, no one can study the politics and economic of sports without turning first to Danielson. That is a considerable achievement.

Networks of Champions: Leadership, Access, and Advocacy in the U.S. House of Representatives. By Christine A. DeGregorio. Ann Arbor: University of Michigan Press, 1997. 185p. \$39.50.

Robin Kolodny, *Temple University*

Christine deGregorio has assumed a major task in this work, which explores the relationship between Congress and the organized interests who wish to influence its work. To do this, DeGregorio undertakes a two-front approach: examining the

assumptions we have about both the nature of leadership in Congress and the extent of influence the interest community has with our nation's lawmakers.

DeGregorio's central argument is that we do not appreciate the complex relationships between leaders and groups. Furthermore, we credit formal party leaders in Congress with a monopoly on power in Congress and underestimate the important informational role advocacy groups can play in the public policy process. The author first wants to reexamine notions of what it means to be a leader in the House, including an examination of the role of congressional staff, and next to test whether groups that have influence over lawmakers have such influence because of their resource (money) advantages. To do this, DeGregorio has used a somewhat unconventional method: elite focused interviews of 97 members of the advocacy community. She has asked these advocates to identify House leaders on one of six public policy issues featured in the 100th Congress and then to assess their own satisfaction with the results they garnered. The 97 respondents represent a broad cross-section of the advocacy community in both sector (public or private) and type of group, as well as the resources each group possesses. The six bills studied also provide a good mix of policy arenas, complexity, scope, political conflict, and salience. DeGregorio's method is meticulously discussed in two appendixes.

On the topic of House leaders, DeGregorio finds that advocates cite committee and subcommittee leaders as being much more important than either formal party leaders or Rules Committee members, and she mentions (but never really elaborates) that some members without portfolio (obscure, that is) also make this list. She also finds that senior level staff members, especially those on committee staff, also are mentioned, though not as much as some cynical congressional observers might think. In this sense, DeGregorio has made one of the contributions she claims: a broadening of the definition of congressional leadership. While the concept of leadership itself is inherently problematic, due to the lack of a reliable followership among individually elected representatives, DeGregorio has shown that a number of individuals assume leadership roles in the formulation of public policy and that different individuals will emerge as leaders based on the topic under consideration and the stage of the legislation in the political process. By proving that formal party leaders are not the focal point of advocates' congressional partnerships, DeGregorio exposes the limits of traditional leadership studies.

The other side of the project is to examine the role of the advocates in the political process. Here DeGregorio asks several intriguing questions about organized interests resources, access, and success. In addition to the traditional interest group categories of professional/occupational groups, corporations, and public interest concerns, the executive branch is included in the mix. DeGregorio makes a convincing case for the inclusion of executive branch officials as organized interests rather than simple extensions of the president. More important, she demonstrates that information from advocates is a more valuable commodity to many officeholders than other resources, such as campaign contributions, in gaining access to lawmakers. Indeed, the relationship between lawmakers and advocates is portrayed as one of complex interdependence, with lawmakers courting advocacy group endorsements for legislative initiatives as much as the reverse occurs. DeGregorio's argument is entirely on target here, and her discussion of the advocates' awareness of their own role as political leverage between lawmakers is quite insightful.

DeGregorio's study is thoughtful and carefully executed.

Still, there are several things I wish the author had done differently. First, I wish DeGregorio had given us more examples of the kinds of relationships she was describing. She spoke to 97 advocates about six different legislative arenas and only gives a few short pages of description on the particulars. Without a fuller discussion of these interactions, I am left wondering about the nature of her findings. For example, under what conditions do "obscure" members become leaders? What difference does it make that advocates make their initiatives primarily toward committee and subcommittee leaders (that is, do we know that any of their efforts remained part of the final bill)? How did such interactions enhance the fortunes of the advocacy groups and the leaders themselves? With the short text of 143 pages, I wish the author had given us another twenty or thirty pages with some insight into the hundreds of examples she must have at her disposal. Second, I wish she had spent more time examining the congressional leadership aspects of her study. The book predominantly covers the issues of access and advocacy over leadership. Part of this reflects the bias of the study: 97 advocates, but no members of Congress. Though DeGregorio begins her inquiry with the help of senior level staff, it would have been nice to have more staff or members interviewed as a control. As it stands, the data may suffer from underlying bias from the advocates, especially when it comes to describing their success at gaining access and their own level of satisfaction with their lobbying efforts. Though I think DeGregorio's analysis could be more complete, students of interest groups, congressional committees, and congressional leadership will find much food for thought.

Disunited States: What's at Stake as Washington Fades and the States Take the Lead. By John D. Donahue. New York: Basic Books, 1997. 256p. \$25.00.

Richard Piper, *University of Tampa*

John Donahue's book is the latest contribution to what the author accurately describes as the "endless argument" over the proper balance between the national government and the states in the federal system of the United States. Like recent works on the subject by Paul E. Peterson (*The Price of Federalism*, 1995) and Alice M. Rivlin (*Reviving the American Dream*, 1992), this book addresses both political scientists and a broader audience of policymakers, students, and concerned citizens, and it does so in a fashion that is both readable and informative. Its greatest contrast with most other recent books on federalism, and even more so with much of the prevailing conventional wisdom among politicians in Washington and the state capitals, lies in its emphasis on the risks of decentralization. It is less novel in this respect than its author suggests, however.

Where Peterson and Rivlin both distinguish between "developmental" and "redistributive" public policies and favor devolution to the states of primary responsibilities in the former domain, Donahue casts doubt on the existence of a clear dichotomy between these two spheres of public policy. Although he reinforces much of what Peterson, Rivlin, and others have suggested about the perils of a "race to the bottom" among state-centered social welfare programs and about the obstacles to effective state redistribution of wealth in general, Donahue also warns of danger in state-driven developmental realms, such as business attraction, education, and job training. In this respect, his book resembles David Robertson and Dennis Judd's *The Development of American Public Policy* (1989), though, surprisingly, Donahue never cites it.

Donahue's major theme is that the increasingly global market economy and its potential threats to "America's future as a middle-class culture" should be focusing our efforts more on enhancing the effectiveness of the national government than on devolving powers to the state governments. In his view, the state governments not only are unable to promote egalitarian redistribution of wealth in an era of widening gaps between the rich and the poor but also engage in unwarranted competitive courtship of capital and demonstrate serious inadequacies in the skill-building areas of education and job training. Of these claims, those relating to state industrial policies are the best documented and most convincing. Donahue devotes two chapters and an appendix to analyses of the industrial development and business-attraction policies of the states. The appendix provides the interested reader with a useful survey of the scholarly literature on the subject, despite some omissions.

A strength of this book is that it seeks to place the U.S. debate over centralization into a contemporary global context and cites comparative examples more than most other recent works on the subject have done. Yet, the reader is often left yearning for more than the brief comparative evidence that Donahue introduces. For example, Donahue tells us, "even though the European Union falls well short of 'nationhood' by most measures, it maintains tougher limits on internal competition for investment than does the United States" (p. 115). There follows a brief paragraph that offers only fragmentary data, and then Donahue moves on to other matters.

Some additional comparative analysis in this relatively short book (only 169 pages, exclusive of back matter) would have enhanced its value for political science scholars particularly since its major theme is that the globalized economy has created conditions which make further decentralization to the states inadvisable. Even nonscholars would benefit from the addition of evidence concerning how the European Union and national and subnational governments in other parts of the world centralize or decentralize policy functions. Unfortunately, this book offers only enough such data to tantalize the reader. Nonetheless, Donahue is to be commended for at least introducing limited evidence drawn from Europe and elsewhere on the devolution question. This is more than most recent books on American federalism have offered.

One other area in which some additional substance would enhance this book lies in its historical treatment of the subject. Donahue provides a good but brief historical overview in the second chapter and supplements it a little elsewhere. Yet, only the reader who has encountered in other sources the New Deal liberal cases for centralization and against "states' rights" will recognize the extent to which many of Donahue's arguments are reminiscent of them. Although the global context and the administrative capacities of the states have changed dramatically since the 1930s, New Deal era arguments by Luther Gulick, Harold Laski, *New Republic* editors, and others against overreliance on the states are strikingly similar to some of those put forward by Donahue.

Donahue concludes his book with recommendations for a "new balance" between the national government and the states. Although he is careful to recognize complexities and nuances at many points in his book, his conclusions are so heavily weighted in favor of the national government and against the states, and are so polemical in tone, that they may alienate public policymakers who might otherwise find merit in some of his individual recommendations. Perhaps cognizant of this danger, given the present political mood in the

United States, Donahue prefaces his suggestions by saying: "Do devolve—where it makes sense" (p. 165). Aside from a lengthy footnote endorsing state primacy in law enforcement, however, and his opposition to congressionally imposed unfunded mandates, Donahue offers little comfort to contemporary decentralizers.

This engaging work should stimulate thought and discussion on the subject of federalism. Its focus on the global economy and its efforts to introduce comparative data are commendable, even though further comparative analysis would shed additional light on the topic. One can hope that this book will be taken seriously by policymakers before they rush headlong into devolution of functions that may be performed more effectively by the national government than by the states. Donahue is at his most persuasive in linking state public policy deficiencies to potential dangers to the American middle class in an increasingly globalized market economy. Readers should give this book their careful attention.

Pursuing Power: Latinos and the Political System. Edited by F. Chris Garcia. Notre Dame, IN: University of Notre Dame Press, 1997. 480p. \$50.00 cloth, \$25.00 paper.

José E. Cruz, *SUNY-Albany*

F. Chris Garcia's *Pursuing Power* is an excellent and useful contribution to the scholarship on Latino politics. It covers the most significant issues that Latinos face in their pursuit of power, and it offers insightful analyses of these issues, including electoral participation and representation; community organizing; the contribution of women; educational, language, and foreign policy issues; immigration; and affirmative action. The concluding section offers an array of provocative perspectives and raises a set of fundamental questions both for research and practice, focused on the future of Latino politics.

Although the book is theoretically suggestive, it does not break new theoretical ground. It does not offer a new model to explain the distinctiveness of the Latino case, as attempted by Rodney Hero in *Latinos and the U.S. Political System: Two-tiered Pluralism* (1992), nor does it spell out the contextual and strategic requirements for the maximization of Latino political participation in the manner of Fernando Guerra and Luis Ricardo Fraga ("Theory, Reality, and Perpetual Potential: Latinos in the 1992 California Elections," in *Ethnic Ironies*, ed. Rodolfo O. de la Garza and Louis DeSipio, 1996). Instead, the material is organized according to the Eastonian political systems framework, although Garcia is quick to point out that this is a heuristic rather than an indication of theoretical bias.

The lack of theoretical focus is understandable in an anthology such as this. Implicitly, however, the book rejects all existing paradigms as inadequate and all the proposed distributions of power that follow from existing paradigms as unacceptable.

Power cannot be foreclosed to Latinos—as structuralists would argue—given the phenomenal gains in political representation obtained during the 1980s and early 1990s. Between 1983 and 1993, for example, the number of Latino elected officials throughout the country increased an average 41%. Indictments of pluralism would include the fact that access was skewed, with most representatives elected at the local level, and was well below the proportion of Latinos in the total population, both nationally and by state. Dominant political coalition theorists should explain why, even though Latino representation in policymaking bodies favorably af-

fects Latino communities, the extent of substantive representation is minimal and uneven. At the national level, Latino constituencies do not seem to have much influence in how Latino representatives vote, and direct substantive representation is minimal.

Remarkably, even though this anthology includes the perspectives and analyses of 21 contributors, it has a coherent argument. All the authors seem to agree that Latinos are an increasingly significant segment of American society but have not been accommodated or appreciated as much as they have been recognized. Their continued socioeconomic and political disadvantages raise the question whether they should adopt "immigrant" or "racial minority" strategies for economic betterment and political incorporation. Furthermore, because the prospects for a more inclusive, egalitarian, and prosperous society depend in large part on how Latinos fare within that society, they ought to play an increasingly important part in the transformation of the social, economic, and political institutions of the United States.

Evidence of the first point can be easily noted in the attention to Latinos paid by such governmental agencies as the Bureau of the Census, such private organizations as the Ford Foundation (which funded the first national political survey of Latinos, conducted in 1989), and corporations that target their products to the burgeoning Latino market. This attention, however, contrasts with the recrudescence of anti-Latino feeling in recent times, best exemplified by the immigration and affirmative action debates, English-only initiatives, and welfare reform.

On the second point, the book strikes an ambivalent note: Yes, Latinos have suffered from discrimination and continue to experience a significant lag in socioeconomic status, but it is also true that advancements have been made in terms of political representation and on the road toward higher prestige and income occupations.

The response on the third point is even less clear. How can Latinos contribute to the transformation of American society and politics? Garcia's answer is somewhat contradictory. He writes that "Latinos' historical determination, diligence, and perseverance inevitably will result in a society in which equality and justice are much closer to being realities for all U.S. citizens" (p. 435), while he recognizes that "as the 1980s drew to a close, it was evident that, although some minor gains had been made, Latinos by and large were disappointed in the changes that had occurred over the past ten years" (p. 436). Thus, his optimistic certainty about the future of Latino politics does not seem warranted by the lessons of the past.

Aside from this discrepancy between retrospect and prospect, the volume raises other equally troubling questions. It is true that if Latinos emulate the example of blacks in claiming status as a racial minority group they will sacrifice long-term incorporation and progress for short-term advantages? How can Latinos speak and act as a homogeneous group given existing divisions along the lines of geographic settlement, national origin, ideology, partisanship, and citizenship status? Is it true that electoral and litigational strategies have reached a point of diminishing returns? If so, then what new conceptualizations, strategies, and approaches should Latinos politics adopt to confront the challenges posed by the current situation? How can Latino researchers reconcile the requirements of truth and policy advocacy? For example, the book establishes that the Voting Rights Act not only has been limited in increasing Latino participation but also may discourage participation by contributing to the formation of safe districts. This needs to be said without undermining the prospects for further governmental intervention.

These are some of the most important questions raised in

this well-written, informative, penetrating, and provocative volume. The book does not balance the number of questions it formulates or suggests with the answers it provides, but this is hardly a shortcoming. Instead, it is an indication of the possibilities for future research on Latino politics. For example, the implicit rejection of existing paradigms is a clear cue, and some of the concerns raised regarding the role of ethnic identity, electoral systems, and the policy priorities of the state in fostering or hampering Latino political incorporation are equally suggestive.

If, as one of the contributors indicates, the focus on policy parity of interest-group politics is flawed, then it makes sense to argue that the fundamental challenge to Latino politics in the next century will be to develop "a much broader understanding of community that explicitly includes the public interest" (p. 443). This means that, to succeed, Latino politics must overcome—both in theory and practice—the criticism that it is simply a zero-sum game. *Pursuing Power* is infused with that spirit of community—Latino progress must also be progress for all—but it does not tell us how to make that spirit a reality. The book on Latino politics which does that will be much more than a mere contribution to scholarship.

Religion and the Culture Wars: Dispatches from the Front.

By John C. Green, James L. Guth, Corwin E. Smidt, and Lyman A. Kellstedt. Lanham, MD: Rowman & Littlefield, 1996. 369p. \$39.95.

Christopher P. Gilbert, *Gustavus Adolphus College*

This volume compiles nearly fifteen years of research by four of the most respected scholars in the field of religion and politics. While the title may suggest a narrow focus on the Christian Right and disputes over contemporary social issues such as abortion, the work ranges over a broader set of topics to develop a theoretical framework from which to understand the political relevance of religion in U.S. politics. The authors use existing data, such as the National Election Studies, as well as their own surveys of voters, activists, and clergy. The material is organized chronologically, and several chapters are reprints of previously published articles; the core chapters described below are new, however, and offer critical insights into fundamental questions of measurement, concept formation, and the salience of religious factors.

The chronological organization of the volume has one clear advantage: It shows the development of theory regarding linkages between religiously motivated social movements and political institutions, such as parties and interest groups. It is clear scholars have come a long way in understanding the Christian Right and its effect. One disadvantage is that the key linking mechanisms, measured through religious commitment and tradition, do not come until chapter 10, which stands out as the most important chapter. The authors argue persuasively that "grasping the essentials of religion is a potent first step in understanding its connection to politics" (p. 175). Using a large 1992 sample and their own battery of questions, they develop measures of religious tradition and religious commitment and test their salience for predicting political attitudes and behaviors. They choose to operationalize religious commitment by carefully sifting out its absence; that is, they identify those individuals who show little to no religious affiliation, belief, salience, ritual observance, and private devotionism. Such people comprise one-quarter of the American population and show behavior patterns distinct from those of believers. While the religious commitment scale is less successful in revealing differences among high-commitment citizens, additional variables provide im-

proved measures of religious tradition and other components of spiritual life in order to tell the complete story.

Additional chapters demonstrate the importance of studying political activists, particularly with regard to the Christian Right. The authors show that diversity exists within Christian Right organizations; combined with existing tensions within American evangelicalism, and the autonomy of local congregations, their work balances the often facile analysis that projects the Christian Right as a monolithic movement with a simplistic agenda.

Some of these findings are not new to the field; indeed, researchers without background in this subject area would do well to trace the growth of theory and the refinement of concepts that occur through the book. Put another way, this book drives home the idea that there should be no subfield of religion and political behavior that is distinct and separate from the field of mass political behavior generally. Too many researchers have virtually ignored the work of these authors and their counterparts, choosing instead to overlook the relevance of faith; to capture it with poor or too-simple measures such as church attendance or the dated Protestant/Catholic/Jewish/other/none scheme; or to categorize the political relevance of religion solely in terms of the Christian Right movement. The National Election Studies now contain sophisticated questions that explore all the importance facets of religion described in the volume; these measures exist largely because Green and others, David Legee, Kenneth Wald, and other collaborators have continued to demonstrate how such measures matter and how they improve upon earlier formulations. We now understand that church attendance alone contributes little to the political relevance of an individual's religion. Rather, church attendance proxies for personal faith, devotion to liturgy, and the salience of prayer and Scripture reading; most important, the influence of each of these factors differs in terms of depth and the attitude or behavior in question, so much so that attendance alone cannot unpack the full flavor of the connections between an individual's faith and church life and his or her political views.

Despite these key contributions, the authors themselves also fail to note the full implications of their theoretical framework. Specifically, the fact that religion is both a personal and a social activity in the United States necessitates an understanding of the church, in its various forms across denominations and faith traditions, as a politically relevant unit. The authors hold a crucial piece of the puzzle with their firm grasp on theological and historical differences among faith traditions and their knowledge of the political roles played by clergy in several different denominations. Yet, they perform little analysis that measures important aspects of congregations themselves. Pathbreaking research by Wald, Owen, and Hill ("Churches as Political Communities," *APSR* 82(June 1988):531-48) demonstrates the salience of congregations as cue givers and sources of influence. Contextual analysis, perhaps not coincidentally another line of behavior research that has received far too little attention until recently, has clear relevance to the work of Green and others (e.g., see chapter 13 in Robert Huckfeldt and John Sprague, *Citizens, Politics, and Social Communication*, 1995). Their theoretical understanding of churches as political communities—and therefore as relevant contextual units—is perhaps more limited than it could be in this regard, particularly with respect to claims about "the social embodiment of religion and political behavior" (p. 174). If affiliation and involvement are the critical factors that determine the extent to which religion matters in political terms for a citizen, then it stands to reason that the issues of "affiliation with and involvement in what" necessitate operationalization of some aspects of the

religious environment. Wald, Owen, and Hill show distinctive "church effects" even when the church's theological orientation fits poorly with its members' beliefs; Huckfeldt and Sprague similarly demonstrate church effects without resort to arguments about theology.

The authors make a lasting contribution in showing indisputably that religion must be considered as a factor *central* to many citizens' political attitudes and actions, peripheral to other citizens, and irrelevant to a large segment of the population. Their work deserves not to be typecast as merely religion and politics; rather, it provides an essential guide to the full comprehension of the multifaceted nature of Americans' political beliefs.

The Road to Nowhere: The Genesis of President Clinton's Plan for Health Security. By Jacob S. Hacker. Princeton, NJ: Princeton University Press, 1997. 248p. \$39.95.

Mary E. Guy, *Florida State University*

Yet the methodology of policy analysis has come to embody an emaciated conception of politics and policymaking. It is fixated on policy solutions, with solutions understood as rational choices to achieve given objectives within fixed constraints. This exclusive preoccupation with solutions prevents a full realization of the political, institutional, and cultural context in which policy ideas must be justified, debated, enacted, and implemented (p. 179).

There you have it. Jacob Hacker's requiem for health reform details the rise and fall of the Enthoven plan, the brainchild of policy experts who were political neophytes. Hacker's assessment is measured and balanced. The 182 pages of narrative, embellished with appendices and footnotes, describe how candidate Clinton became enamored of the Jackson Hole gang and their idea for managed competition.

This is one of the best histories you will find of how the Enthoven plan was born and how it won the day when candidate Clinton decided to advance health reform as a campaign issue in 1992. It positions this attempt at health reform in light of earlier (failed) presidential efforts to bring access to health care in this nation up to a par with that in other Western nations.

The lesson to be learned from this book is that policy does not belong only to the experts. It belongs to all stakeholders, of which there are many when it comes to health issues. And the more complicated a policy reform, the less likely it is to be favored by the public or Congress. This book will be read by two audiences: those who are interested in health policy per se and those who are interested in the policymaking process. It is equally instructive for both.

Health reform is a complicated story that is not finished. According to the U.S. Bureau of the Census, about 36 million Americans were uninsured when candidate Clinton noticed that health care could be the road which would take him to the White House. The numbers have steadily increased, and in 1996 there were almost 42 million uninsured. Thus, the problem continues to escalate. Systemic change failed in 1994. In 1997 the Clinton administration, having learned from the defeat, is attacking the problem by focusing on pieces of the puzzle rather than on the puzzle as a whole. Fighting little battles rather than big ones, health reform now takes the form of step-by-step changes. Thus, as Charles Lindblom explained some time ago, the nation muddles through. Reliance on policy experts who are politically naive has given way to reliance on political experts who know how to sequester policy issues into digestible bites.

The experience of the Clinton health reform initiative was foretold by the Medicare Catastrophic Coverage Act of 1988.

The first major enhancement in Medicare benefits since the program's inception in 1965, the bill was rescinded shortly after its passage. A survey of Medicare recipients conducted in spring 1989, about halfway between the time the legislation had been signed and when it would eventually be repealed, showed that respondents' knowledge about the specifics of the law was vague and often erroneous (Rice et al., "The Medicare Catastrophic Coverage Act: A Post-Mortem," *Health Affairs*, Fall 1990, pp. 75–87). Out of eight questions asked, the typical respondent answered only two correctly. For example, more than 91% erroneously believed that everyone who had Medicare would be required to contribute toward the cost of the new Medicare benefits through an increase in their federal tax payments. Fewer than 40% correctly understood that when the new legislation was fully phased in, Medicare would cover some of the costs associated with prescription drugs. The seeds of the legislation's destruction are both obvious and simple: The elderly are very worried about having to incur out-of-pocket expenses. What the elderly wanted was complete insurance coverage with no deductibles or coinsurance. What the act provided was far less. The lessons provided by the rise and fall of Catastrophic Coverage are clear. First, citizens are likely to misunderstand the purpose as well as the provisions of a proposal in spite of factual information that is provided to them. The second lesson is closely related to the first: Successful legislation will be that which simply and clearly spells out its benefits. Third, success comes when people get what they want most: quality health care with only minimal, if any, out-of-pocket costs.

As the debacle with the catastrophic care legislation shows, Americans are afraid of rising health care costs but are also afraid of health legislation. If Hacker fails in this book, it is because he places too much emphasis on individual actors and ignores the basic truths of health policy: Grand schemes fail, and small steps succeed. Small steps are more discrete, target a specific constituency, and lend themselves to explanation. Big steps are broad, target multiple constituencies, and are difficult to explain to audiences that include both consumers and providers. As Hacker explains, the Clinton plan was developed with impressive intellectual energy coupled with political naïveté. Its advocates were unable to persuade citizens that integrated, managed competition was preferable to the crazy-quilt system to which they had become accustomed.

On the cutting room floor is left the story of how the medical establishment took umbrage with the role of Hillary Rodham Clinton and Ira Magaziner at the helm of the reform initiative because they did not have medical credentials; the fact that the American College of Surgeons filed suit against the First Lady, claiming she had no right to convene the health reform task force; the fact that physicians became more nervous about reform as nurses were brought into the loop in greater numbers than had happened in past health reform initiatives; the fact that physicians lobbied their patients during routine office visits, dissuading them from supporting the reform movement. To make a long story short, the hegemony that physicians' groups were accustomed to exerting in health policy debates was sorely challenged by the Clinton administration's health reform plan.

In order to tell a story in the pages allotted, the author had to cut somewhere, and his focus on the confluence of public opinion polls, health economists, and campaign strategy provides a useful perspective for enlightening a doomed policy initiative. In his effort to present clearly the plan and the policy process through which it moved until it went moribund, Hacker deleted a hefty portion of the action that surrounded the policy debate. The fact that Hillary Clinton

became a lightning rod for the proposal's detractors deserves more attention, as do the many little mansions of the medical establishment: insurers, practice groups, hospitals, pharmacies, and each health profession's lobbying effort. Nevertheless, for the part of the story that he tells, Hacker tells it well—better than you will find elsewhere.

This book cuts away enough of the detritus that the reader can learn about the actions of key players and the events that propelled them forward. It is recommended reading for those interested in health policy and for those who have yet to be convinced that there is more to policy analysis than sophisticated equations and the public choice paradigm.

Congress as Public Enemy: Public Attitudes toward Political Institutions. By John R. Hibbing and Elizabeth Theiss-Morse. New York: Cambridge University Press, 1995. \$54.95 cloth, \$16.95 paper.

Stephen C. Craig, *University of Florida*

Following the Republican sweep in the 1994 midterm, as Bill Clinton was awkwardly proclaiming his continued "relevance" to the process of national policymaking, few would have predicted not only that the president would be reelected two years later but also that he would win handily in a one-sided contest whose outcome never seemed in doubt. There were many factors that contributed to Clinton's success, but one of the most important of these stemmed from the miscalculations made by GOP congressional leaders during their battle with the White House over the 1996 federal budget. House Speaker Newt Gingrich and his allies apparently felt that by drawing a line in the sand and refusing to pass stopgap spending legislation, they could either force the president to make policy concessions or else allow a government shutdown that would cripple his administration once and for all. It did not work. When Clinton's refusal to bend led to a suspension of all but essential government services on two separate occasions during late fall and winter 1996–97, the American public did indeed react with alarm. Most did not, however, blame the president for what had happened. Most blamed Congress and its Republican leadership in particular.

According to John Hibbing and Elizabeth Theiss-Morse, this should not have come as a surprise. In their provocatively titled *Congress as Public Enemy*, the authors suggest that the legislative branch is viewed by citizens as the central institution of contemporary democratic politics (especially in non-parliamentary systems). As a result, it is dissatisfaction with Congress which supposedly drives the overall lack of trust in government that is so widespread among the American public in the 1990s. And what do people so dislike about Congress? Not its partisan or ideological makeup and (for the most part) not its policy outputs. For Hibbing and Theiss-Morse, the problem lies first and foremost with the democratic process itself. Democracy is ugly, and Congress is the institution which reflects that ugliness more than any other. Thus, simply by "being itself," Congress—along with other powerful and independent legislative bodies at the state level and elsewhere around the world—actually contributes to the lack of popular support for the political system as a whole.

Hibbing and Theiss-Morse begin this interesting and well-written volume with a plea for better theory accompanied by better data. Their theoretical argument is twofold. First, taking exception to the Eastonian distinction between diffuse and specific support, they contend that researchers need to specify clearly the possible *objects* of system support and that

among the most important of these objects are the formal institutions of government, including Congress. Second, they hypothesize that the granting or withholding of support will often be based on citizens' attitudes toward the *processes* employed by institutions and decision makers as they go about doing the people's business. In democracies, Hibbing and Theiss-Morse believe that such procedural evaluations tend to be centered on perceptions of efficiency (whether decisions are made "in an expeditious and direct manner") and equity (whether decisions are made "with due concern for all who should have influence" and benefits are allocated "in an equitable and just manner"; see p. 14).

Eschewing standard survey measures such as the ANES trust in government index, the authors opt for a more innovative multimethod approach that uses both qualitative (focus groups) and quantitative (survey research) data. Most of their analysis is based on the latter, from which they learn the following. (1) Approval ratings are substantially higher for Congress as an institution ("no matter who's in office") than for the overall membership, congressional leaders, or even one's own representative; a similar gap between institutional and incumbent evaluations is evident for the presidency and the Supreme Court, but it is much smaller than for Congress. (2) The American public regards Congress as the most powerful institution in our national government but does not believe it uses that power in a positive way to deal with the country's most important problems; to the contrary, there is a sense that Congress is an impediment to presidents who might otherwise be able to accomplish something constructive. (3) There is considerable support for term limits (80% of the national sample), and when respondents are presented with arguments contrary to their own position on the issue, those initially opposing term limits are more likely than supporters to change sides. (4) Approval of the membership of Congress (as opposed to the institution "no matter who's in office") tends to be at least somewhat higher among citizens who think their own representative is doing a good job, majority party identifiers (Democrats at the time), the externally efficacious, the less well-to-do, and, reflecting the importance of procedural concerns, among individuals who disapprove of legislative professionalization (measured by a hodgepodge index that also includes beliefs about congressional "efficiency") and who feel that members attend more to the concerns of special interests than they do to the needs and wishes of ordinary people.

Although scholars have typically stressed the ideological and policy roots of popular discontent, this last point may seem almost axiomatic; there is, after all, a growing recognition that procedural values (including beliefs about who is, and who is not, being represented) matter as well. Of greater interest is the conclusion by Hibbing and Theiss-Morse, based on their focus group data, that many Americans are uncomfortable with some of the qualities that are more or less inherent in the nature of democratic discourse—and in the operation of strong democratic legislatures—that is, "uncertainty, conflicting options, long debate, competing interests, confusion, bargaining, and compromised, imperfect solutions." In short, "people profess a devotion to democracy in the abstract but have little or no appreciation for what a practicing democracy invariably brings with it" (p. 147). There is evidence that citizens are themselves willing to shoulder a portion of the blame for failing to take the initiative and to hold elected leaders accountable for their behavior. Ultimately, though, the real culprits are the politicians and the "Washington system" (of perks, money, and privilege) that corrupts and "seduces members away from fulfilling their responsibility to the public" (p. 62).

Congress as Public Enemy is not, of course, the final word on the subject. Additional research clearly is needed to flesh out our understanding of how citizens perceive and relate to other institutions and other aspects of the political process (such as elections). Furthermore, Hibbing and Theiss-Morse probably are less attentive than they should be to the potential role of policy outcomes (or, attitudinally, what they call "valence dissatisfaction"; see p. 55) in shaping people's feelings about government. Perhaps most crucially, the authors address only briefly the question of why support for Congress, and for government generally, has dropped sharply in recent years. In fact, they raise the theoretical ante by suggesting that current low levels of congressional support are, when viewed historically, more the rule than the exception, that is, "the drop in confidence from 1967 to 1971 [followed by relatively modest changes since then] might look large not because confidence in 1971 was abnormally low but because confidence in 1966–67 was abnormally high" (p. 35). If this is true for Congress, could it also be true for other dimensions of public support? And if it is, does that mean we have been spinning our collective wheels in a misguided effort to account for the emergence of the "angry voter" in American politics? While the authors make no such claim, it seems to follow implicitly from the logic of their argument.

There is, then, considerable work yet to be done as we continue to seek a better understanding of the relationship between rulers and ruled in the United States. In the meantime, *Congress as Public Enemy* is an important and timely report that should be of interest to anyone who studies public opinion, attitude measurement (especially in terms of the complementary use of survey research and focus groups), or American politics generally.

Gender, Families, and State: Child Support Policy in the United States. By Jyl J. Josephson. Lanham, MD: Rowman & Littlefield, 1997. 210p. \$62.50 cloth, \$23.95 paper.

Deborah McFarlane, *University of New Mexico*

This book is about child support policy in the United States. Since 1974, the United States has developed and implemented a comprehensive federal child support policy. "What kind of solution is this?" asks Josephson. What are the problems that this system of child support enforcement addresses? "Answering these questions is at the heart of this book" (p. 2). What is dazzling is that the book answers these questions at so many levels: theoretical, empirical, and normative.

The author points out that public policies take place "in a particular historical, political, and institutional context" (p. 2), and they are shaped by ideas. Child support policy lies at the nexus of social welfare policy and family law, both of which are terribly complex. Fortunately for the reader, Josephson is up to the task. She not only provides a coherent explanation of the institutional and historical context of child support policy but also brilliantly grounds that explanation in theory.

The strongest theoretical traditions in the American polity are liberalism and republicanism; for this reason, Josephson refers to the United States as a "liberal republic." She explains how each conceives of the family-state relationship and provides a feminist critique of each conception. For example, neither tradition has historically found a place for women in the polity.

Both liberalism and republicanism have influenced family law and social welfare policy. The notions that clear reasons must be given for state action and that government should be

limited in family life come from the liberal tradition. The republican tradition stresses the cultivation of civic virtue in children, which presumably means that the state has an interest in caring for and educating all children so that they can be good citizens. Josephson provides another lens, the economic traditions and practices of the United States. Liberal republics with market economies have an interest in limiting their financial liabilities (p. 20). Current debates over changes in families and pertinent social policies, such as child support, reveal some of these philosophical incongruities. Given the conflicting state interests with respect to families, it is not surprising that public policies toward families, including child support, have disparate goals.

The second chapter examines the history of child support policy and reviews recent scholarship addressing its implementation. Until 1974, the amount of support required of a noncustodial parent was largely left up to judicial discretion. Unlike other aspects of family law, however, child support has become increasingly regulated and federalized. Because child support policy was created as part of the AFDC program, both its purposes and institutional features are "more in keeping with the U.S. social welfare system than with the tradition of family law" (p. 32). Non-AFDC custodial parents (usually women) may use the child support enforcement bureaucracy, and AFDC mothers *must* use it, although they may keep only \$50 in child support above the welfare allotment. Here the goal of state fiscal limitation supercedes child welfare.

Recent scholarship has examined the cost effectiveness of child support policy, enforcement, and child well-being. The federal government no longer saves money through this program because it bears most of the costs, and the states receive the income. One comprehensive analysis of the effect of this policy concludes by arguing for a system of child support insurance (p. 51). What had not been studied is how child support policy affects the lives of individuals and families.

The fourth chapter describes how the system operates at the state level by investigating the implementation of child support law in Maryland and Texas and analyzing the effects of that law on individuals and families. The work is thorough: Josephson examined court documents, surveyed administrators and clients, and even conducted interviews with clients, both male and female. This section could have been improved, however, by the use of an implementation framework (e.g., Mazmanian and Sabatier); such a model could have sharpened the state comparison and provided more insight on the most important factors in implementation.

The findings are original and poignant. Now we can really feel the effect of contradictory policy goals both on administrators and clients. Here is a system that shames and disciplines some women—especially the poor—while tangibly assisting others. The same system compels some men (and sometimes women, when they are noncustodial parents) to provide support for their children when they might not otherwise do so, while enforcing unrealistic expectations on others, particularly very poor men.

But Josephson is not sentimental. The fifth chapter returns to normative questions with special attention to gender. Can we devise policies that can support families and also promote gender equality? To do that, she argues, we have to reformulate some of our most basic ideas about the state and about the public-domestic relationship. The final chapter summarizes the main conclusions of the study and discusses how the child support system might be reformed.

In sum, *Gender, Families, and State* is first-rate scholarship. Using a variety of methods, Josephson has thoroughly ana-

lyzed child support policy. The empirical work alone makes a major contribution to the scholarship in this substantive area. But that is only a small piece of what this book offers. In an era of welfare reform, Josephson has pointed us to the right questions. What kind of solution does a particular policy offer? What are the problems that it purportedly addresses? What about the welfare of the children? Do families have to be self-supporting economic units? How can public policy support families and promote gender equality? Are state fiscal interests superceding the well-being of children, particularly low-income children?

Kinship and Politics. By Donn M. Kurtz II. Baton Rouge: Louisiana State University Press, 1997. 249p. \$40.00.

S. Sidney Ulmer, *University of Kentucky*

This book is properly placed in the context of social background studies, though, as might be expected, it has its own particular twist. The belief that drives such work is that we are all the product of earlier life experiences, and these earlier experiences hold significant implications for future behavior. In the judicial context, the primary focus of those working in the area has been either to gather and present background information on some set of judges or to use such information to explain, in part, the decisions that judges make. The work of Cortez Ewing and John Schmidhauser exemplifies the first, that of Stuart Nagel and Neal Tate the second.

In *Kinship and Politics*, Kurtz follows the path laid out in 1959 by Schmidhauser, with one important exception. Whereas Schmidhauser identified a large number of potential variables, Kurtz focuses exclusively on the "Political Family" and its various extensions. This political family exists when one or more relatives have held public office, that is, all elected officials as well as all major political appointees at every level of the system. This is a unique definition and, perhaps, a corruption of the word *family*. But whether it will prove to be a useful research concept remains to be seen.

Essentially, the author limits himself to gathering information on the political family backgrounds of 98 judges of the Louisiana Supreme Court (1812–1988) and 104 Supreme Court justices (1789–1988). By explicitly denying any attempt to link background and decisions, Kurtz denies one the opportunity to offer the stock criticisms sometimes associated with such omissions. His more limited aim is to "add to our store of knowledge of the kinship factor in politics by focusing on the public service careers of the [judges'] families . . ." (p. 2). And add he does, with twenty figures or tables in one hundred pages of text, five pages of references, a forty-eight page bibliography, an eighteen-page index, and appendices running seventy-two pages.

He finds, *inter alia*, that a majority of the judges studied were from a political family, that the political activity of these families was spread over three or more generations, that the marriages of judges and their children extended family political influence, and that kinship connections frequently crossed state boundaries. Thus, he writes that judges' political families continue to have an influence on elite composition.

Kurtz suggests that interest in social background studies and political elites has declined somewhat in recent years. He seems to attribute the decline to a cultural bias against focusing on the unequal distribution of power among office seekers at the political starting gate, an inequality he imputes to differences in family background. While such a bias may

exist, there may be different, and possibly better, reasons for the disinterest he detects.

One reason is that while public officeholders may constitute, in one sense, a kind of political elite, they are not and cannot be viewed as traditional political elites, with all the pejorative implications attributed to such groups. In more classical terms, political elites have possessed greater political power than nonelites. They have been unified, self-conscious, and usually autonomous; self-perpetuating and answering only or primarily to the interests of the group from which they spring. In an open democratic political system, such descriptions are clearly not that germane.

Public officeholders in the United States may very well be able to help us or hurt us, on occasion, as much as the political elites defined above. But the arbitrary and relatively cost-free exercise of power associated with historical elites is not on the top-ten list of things to worry about in our political system. Since we are more likely to study what we fear than what fears us, scholars may choose to limit their concerns about political elites, especially if by that we mean all those who hold public office. Putting politicians in office may not be risk free, but neither are we in the age of the Athenian tyrants. Indeed, the author does nothing to establish that we would be better off without political families, as he defines that term.

A second reason is that most scholars who have authored social background studies of judges (including Schmidhauser) have conceded that background would be most significant if it could be shown to affect public policy. Earlier attempts to establish such a linkage reflect that view. A major problem with these studies, however, is that by and large the nexus has not been parsed for time. Correlations that hold for some periods but not for others suggest that something other than cause-and-effect relationships are involved. At best the "causative" factors are conditioned; at worst, the correlations are spurious. It is not too difficult to suggest factors that might mitigate the effect of social background on the decisions of judges; to mention a few: the law of "anticipated consequences," stare decisis and other legal traditions, the effect of small group settings, and the attitudinal structure of the judges on a particular court.

So, while some may wish to suggest a direct relationship between background and the decisions of judges, bluntly put, that twain has yet to meet. The failure to establish social background as a predictor of judicial decisions may account, in part, for the slackening of interest to which the author refers.

In sum, though, *Kinship and Politics* makes a notable contribution to the literature dealing with the background of judges. Apart from useful information on sources of recruitment, the book presents data, insights, and argument—any or all of which may trigger new studies, new designs for research, or even larger theories which incorporate social background but do not depend on it exclusively to carry the load.

Crisis and Political Beliefs: The Case of the Colt Firearms Strike. By Marc Lendler. New Haven, CT: Yale University Press, 1997. 206p. \$30.00.

Laura R. Woliver, *University of South Carolina*

Fortunately for the scholarly community, Marc Lendler was around the Hartford, Connecticut, area during a lengthy labor strike at the Colt Firearms plant, and he had the insights, skills, and wisdom to follow the strike, attend union meetings, and conduct sensitive, enlightening interviews with

strikers, their families, and plant officials. *Crisis and Political Beliefs* displays that these workers, under the dire circumstances of a more than four-year strike, gained a sense of self-respect, community, and solidarity along with keen political insights.

When studies of labor unions and other group efforts focus on monetary and material gains alone for the participants, they may mismeasure the effects of the effort and the consequences for our politics. Many workers in the Colt strike felt and acted upon a sense of solidarity and community that went beyond the merely individualized, rationally acting, autonomous calculator (the "rational striker") assumed as the only motivation by some scholars. Lendler found "the conflict led the strikers to develop norms in which immediate individual self-interest played a lesser role than cooperation and solidarity, and in which dignity and self-respect became ends and not means to other ends" (p. 35).

Communal values were given more than lip service, Lendler shows. It is easy to claim to an interviewer that fellow strikers were like "family." The actions of the strikers displayed how they lived out their solidarity through practical cooperative activities, such as repairing one another's cars and houses, to name a few. "The argument is not that the strikers were gushing sentimentalists," he points out, "but that a new form of rationality emerged, based less on finely tuned calculations of individual self-interest than on collective definitions of interest, a shared purpose, willingness to sacrifice for it, and a sense of responsibility to each other" (p. 57). Strikers near retirement when the walk-out call came lived the family vision clearly, participating in a prolonged strike long past time when it made mere financial sense. These workers explained to Lendler that the strike was for the sake of a future labor movement, so future workers might be treated like humans, not just tools. Their commitment to a larger labor cause meant that sometimes they were even "prepared to call in an airstrike on their own position" (p. 58). Thus, solidarity was a norm, not just a tool.

Lendler's study is also a clear and logical model of how to conduct a case study which captures the insights and context of the events and participants over time, and extends and expands important theories. One strength of this study is the author's knowledge of modern labor law, antiunion tactics, and union history. Learning from the participants themselves how to reshape the research design is another illuminating aspect of Lendler's approach. For instance, through interviews with workers Lendler realized that for them the strike began before the official first day. The ten months before, when the workers supposedly "ran the plant backwards," helped set the tone of the conflict and formed the attitudes of the workers while on the picket lines. As Lendler explains:

"That end came suddenly, on March 31, 1985, when the contract expired. Since this is a study of how people react to the shattering of socially constructed routine, it might seem more appropriate to take the strike itself as the starting point. That is when the employees literally traded one set of daily tasks for another. But the strikers themselves were emphatic that the ten months spent working without a contract were a formative part of the conflict" (pp. 40–1).

A more distant researcher might have missed such an important part of participants' construction of their injustice frames. Indeed, during the prestrike period, while workers toiled without a contract, Lendler documented remarkably high levels of resistance to plant authorities and support for one another.

Throughout the work Lendler notes the possible drawbacks within his design, and he offers alternative interpretations of what his research might mean. One admirable aspect

of this study, among many, is how he gracefully puts himself into the study, too. He relates how he also experienced labor trauma when he and other faculty were "restructured" out of their positions at a college where he worked. His unwillingness to study these strikers as an outside elite observer from on high (the college professor) is an excellent example of the benefits of nonhierarchical consciously nonexploitive fieldwork. Throughout, the workers speak in their own voice, describing their experiences "with a language which located the terms of the conflict in pride, dignity, and social justice" (p. 60). The interview materials are supplemented and supported by deft surveys Lendler also conducted.

Crisis and Political Beliefs shows that people's political consciousness can change in times of crisis. The strike redrew participants' political geography, revealed some hard-edged class hostilities within their "politics without awe" (p. 80), and displayed their political world more clearly "when the gloves are off" (p. 111). "Alienation," Lendler writes, "may stem from a vague distrust of poorly understood processes or from involvement which fails to achieve ends seen as just. In the case of the Colt strikers, it appears to be the latter" (p. 80). Lendler's research and insights make this a very important addition to our literature. Why would beleaguered workers stay on strike for more than four years? "The rational solution to satisfying daily needs—crossing the picket line to go back to work—was available. The utility-maximizing perspective accounts for some of the prose of the strike, but not its poetry" (p. 109). Our understanding increases because Lendler did not leave out the poetry.

The Future of Governing: Four Emerging Models. By B. Guy Peters. Lawrence: University Press of Kansas, 1996. 180p. \$35.00 cloth, \$14.95 paper.

John D. Donahue, *Harvard University*

Government seems to be in trouble throughout the industrial democracies. Citizens tell pollsters (and affirm at the polls) that they do not trust their government and do not believe it works very well. While depictions of a postwar public-sector golden age and a subsequent fall from grace are often overblown, governments in the United States and Canada, Western Europe, and Japan *have* dropped in perceived performance and public esteem in the 1960s and 1970s, leading to electoral turmoil, austerity campaigns, and a ferment of reform efforts in the 1980s and 1990s. Now what?

B. Guy Peters takes up no less sweeping a question in *The Future of Governing*. What should government do in an age when means dwindle but missions do not? How can politicians and bureaucrats deliver on citizens' expectations despite weakening claims on authority, resources, and popular legitimacy? Why did systems of government that seem to have functioned tolerably well for the industrial democracies in much of the postwar era stumble so badly (and so close to simultaneously)? And how can the surging wave of theoretical work on public-sector reform be harnessed to the service of better practice? Peters has an eagle eye for the right questions.

The Future of Governing is as ambitious as its title suggests. Not only the questions engaged but also the intellectual terrain surveyed are of intimidating scope. This short book features 24 small-print pages of bibliographic references, including works in five languages and covering several disciplines (economics, philosophy, public finance, and business administration in addition to Peters's home turf of political science and public administration.) In less practiced hands such an enterprise could melt into a murky muddle of

jargon-laden abstractions, but Peters remains oriented toward concrete problems, and his writing is almost always crisp and coherent. (It is seldom more than that, however; he regrettably reserves for the footnotes a wit that is mostly suppressed in the text, such as the suggestion that the American cliché "bang for the buck" must be "frappe for the franc" among French military reformers; p. 142).

Peters attempts to herd several decades of reformist thought and practice from throughout the developed world (but especially the Anglo-American countries) into four broad models, each with its core diagnosis of what ails government, each with its characteristic approach to defining the public interest, and each offering its preferred alterations in governmental structure, management, and policymaking processes. The "market government" approach sees the public sector as inherently flawed wherever it departs from the private sector's defining virtues of choice and competition. Traditional government grows from the twisted roots of collectivism and coercion, which must be ripped out and replaced with arrangements that mirror or defer to private markets. The "participative government" model sees the problem not as collective action per se, but as hierarchical structures that deter participation. Including elements as seemingly disparate as communitarian philosophy and the "total quality management" notions borrowed from business management, this approach calls for flattening hierarchies and moving authority closer to the citizens to be served. The "flexible government" model identifies the enemy as static governmental structures that cannot but perform badly in a rapidly changing world and endorses a range of reforms meant to overcome inertia and speed public-sector adaptation. And the "deregulated government" model, which laments the profusion of checks, controls, and safeguards that prevent public servants from exercising their judgment and discretion, prescribes a series of measures to liberate bureaucratic creativity.

As grand organizing constructs go this is not bad at all, although (as with any ambitious taxonomy) particular assignments among categories can seem debatable and boundaries rather arbitrary, while superficiality is an ever-present risk. And when Peters departs from his efforts to categorize scores of individual scholarly and practical works into the four models, and attempts to deploy the models as competing, coherent paradigms, there is an inevitable tendency to caricature.

Peters knows both the parallel universes of public-sector reform: the practitioners who maneuver, mostly by instinct, among real-world constraints and the academics who craft their conceptual constructs disciplined by scholarly standards of coherence and rigor. He observes how seldom these universes intersect. Formal analysis only rarely guides practical reforms, while "analysts really do not know what has been happening as governments invest huge amounts of time and energy to change themselves" (p. 113). Peters sympathizes with both camps, although his ultimate loyalties seem to be with the academy, as when he compares practical reformers to "candidates in a New York City election who go through the city eating pizza in an Italian neighborhood, pirogies in a Polish neighborhood, blintzes in a Jewish neighborhood, and enchiladas in a Hispanic neighborhood" (p. 128). Theorists may get heartburn just thinking about it, but New York politicians have their own good reasons for enduring such a diet at election time, and front-line reformers have their own good reasons for an untidily eclectic pragmatism.

"Many of the same ideas for change have been lurking in government for decades, if not for centuries," Peters notes,

"and they keep reappearing, albeit with different names and slightly different twists" (p. 112). Democratic government is a very old problem with a finite number of potential remedies and no possibility of a once-and-for-all fix. This neither minimizes the value of reform nor the potential for scholars to make distinctive and indispensable contributions. But as Peters observes here and elsewhere, there is a powerful tendency to cycle between the poles of centralization and decentralization, discretion and control, formal structure and flexibility as the dark side of the more fashionable extreme gradually becomes apparent while the other extreme's shortcomings recede from memory.

Peters ends up finding "some validity to all the positions" while stressing "the need for a more highly differentiated and contingent view of the problems and prospects for governing" (p. 125). This conclusion is hardly surprising but no less sound for its predictability. Like government itself, on one of its better days, *The Future of Governing* inevitably falls short of its audacious goals but still gets a lot accomplished. Anyone looking for a cogent bird's-eye panorama of what has been said, written, and done about the whole sweeping question of how people in the industrialized countries go about defining and pursuing their common interests will find this book well worth reading.

Ideologies and Institutions: American Conservative and Liberal Governance since 1933. By J. Richard Piper. Lanham, MD: Rowman & Littlefield, 1997. 449p. \$69.50 cloth, \$26.95 paper.

Nicol C. Rae, *Florida International University*

This interesting volume addresses a neglected but highly significant issue in contemporary American political science, namely, the relationship between political ideologies and political institutions. Examining the period from the New Deal to the present, the author argues that the effect of ideological change within American liberalism and conservatism has not been confined to the realm of ideas but also has had serious implications for America's governing institutions. As political circumstances and electoral coalitions have evolved during this period, liberals and conservatives have, at different times, embraced presidential or congressional supremacy, an expanded federal government, judicial activism and restraint, and preferences for a greater or lesser degree of states' rights vis-à-vis the federal government. In the New Deal era, liberals advocated a strong presidency, an interventionist federal government, a nonactivist judiciary on economic issues, and a strictly limited role for Congress and the state governments. By contrast, conservatives emphasized the powers of Congress, the need for judicial curbs on activist government, a more limited federal bureaucracy, and the constitutional prerogatives of the states. By the 1980s, however, these positions had almost completely reversed, with the size and power of the federal government and states' rights being the only areas in which liberals and conservatives had remained fairly consistent.

In light of these developments, Piper proposes two hypotheses: (1) Ideological movements in the United States have engendered "institutional prescriptions and governance theories" that are "largely but not fully instrumental" (p. 7) in furthering the movements' goals and political power bases; and (2) these institutional prescriptions have had consequences for political institutions, "other aspects of the political process", and other "components of the ideology" (p. 4). Most of the book consists of a detailed examination of ideologies, institutions, and theories of governance during

four periods—1935–45, 1945–64, 1966–81, and 1981–93—distinguished by significant changes in liberal and conservative ideologies and political power bases. For each period the author finds that his two hypotheses are largely corroborated.

Piper provides a very thorough analysis of the essential scholarship and original sources on ideological developments within liberalism and conservatism since the New Deal, and he convincingly relates these to electoral changes and changing ideological attitudes toward governing institutions. In this regard his book will be valuable for students of twentieth-century American liberalism and conservatism, as well as those conducting historical research on changes within and between the various branches of the American political system. Piper also raises a couple of interesting issues for further research. First, in his discussion of the New Deal, he indicates that ideology suddenly became a more significant factor in American politics during the 1930s and has remained so since (p. 25). While this is probably an accurate assessment, it also prompts the reader to speculate about the role of ideologies in American politics prior to the New Deal and whether Piper's hypotheses could be applied to earlier eras in U.S. history, as he implies with reference to the Federalists and the Jeffersonians in his Introduction (p. 2). The second question prompted by Piper's study is whether the evident use of political institutions by ideological movements as means rather than ends in themselves has been a major contributing factor to the widespread public cynicism regarding national governing institutions so prevalent in recent years.

The major problem with this book is Piper's conclusion that liberals and conservatives have regarded political institutions as "largely but not fully instrumental" (p. 7). From the evidence presented here, it is not apparent why the qualification is in order, since in each of the ideological phases examined by Piper the evidence appears overwhelming that political developments, such as the Vietnam war, that placed liberals' and conservatives' current institutional prescriptions and theories of government into question were the driving forces in changing liberal and conservative perspectives on political institutions. In short, when institutions have gotten in the way of liberal and conservative political agendas, it has been the institutional prescriptions that have changed, not the ideologies. An additional problem is the role assigned to political parties, interest groups, and party factions, relegated by Piper to the status of "other actors in the political process" (p. 4), but these have arguably been as important as ideological movements in fomenting change in American political institutions since the New Deal. Finally, the author presents several tables showing liberal and conservative support in Congress on selected issues from the 1930s to the present, but in many cases the sources of the data and the basis of Piper's classification of members into liberal and conservative categories are not indicated in the table or the surrounding text.

These misgivings should not detract from the fact that Piper has produced a stimulating piece of scholarship on an arresting topic. He follows in a worthy (and today regrettably undervalued) tradition that combines historical and theoretical approaches to the study of American political institutions, in the style of such distinguished practitioners as A. James Reichley and James L. Sundquist. Piper further echoes the latter in his willingness to tackle major historical and theoretical issues in American politics that are all too often avoided by contemporary political scientists in favor of narrow and more easily quantifiable research topics.

The interaction among ideologies, parties, and governing institutions is one of the most complex, elusive, and yet

fascinating areas of American political science. This rich, well-written, scholarly book reflects that elusiveness and complexity, and it also makes a comprehensive and intellectually engaging effort to unravel it. If this reviewer cannot agree with all the author's conclusions, he strongly believes that Piper should be commended for having the intellectual ambition to tackle a difficult but essential subject.

New Schools for a New Century: The Redesign of Urban Education. Edited by Diane Ravitch and Joseph P. Viteritti. New Haven, CT: Yale University Press, 1997. 320p. \$30.00.

Kevin B. Smith, *University of Nebraska-Lincoln*

The list of contributors to this volume of essays reads as a who's who of conservative intellectual firepower supporting the campaign for educational reform. And, as befits a book stuffed with contributions from the likes of Dianne Ravitch, Paul E. Peterson, John Chubb, and Chester E. Finn, this stands as a powerful and persuasive brief for the conservative educational cause. For the most part, the authors tackle the unenviable task of offering reasonable solutions to some of the seemingly intractable problems of urban schools, and in the process they make a series of significant contributions to the ongoing debate on urban school reform.

But while the writing and level of scholarship are uniformly high, this is also a frustrating book. Although the word "new" appears twice in the title, with the exception of some relatively minor data-based contributions, there is little that is fresh in the arguments or their presentation. The well-known conservative script of villains, heroes, and solutions is once again repeatedly pressed into service as the underlying framework in many of the essays. I am not altogether sure we need to be told one more time that teachers' unions and bureaucracy are bad, that decentralization and entrepreneurship are good. Regardless of whether you agree with this perspective, it should be clear by now that teachers' unions are not going to disappear from the political landscape, some form of centralized administration will remain in public education, and reinventing government involves costs as well as benefits. Dealing with these realities is harder than divvying up blame and credit, but the effort would also be more accurately described as "new."

Such minor gripes aside, the essays themselves are a mixed bag and are only loosely connected by the general theme of urban education. They include a fairly damning analysis of the bureaucratic pathologies of the New York City public school system, an upbeat update on the spread of the charter school movement, an incisive case study of school reform in Chicago, a treatise on school-based management, and a lament on the politics of education that ends on a hopeful note for change. The lack of a tight cohesive theme should not be taken as a criticism; the eclecticism of the essays contributed to an informative and easy read, and anyone interested in education reform can profitably "cherry pick" essays of interest.

Some of the individual essays are highly noteworthy. I rate among the best Valerie Lee's contribution on what public schools can learn from Catholic schools. Drawing heavily from a broader research project, Lee concludes there are three basic lessons. (1) The core curriculum restricts academic choice, which stands in contrast to "a smorgasbord" of courses that most public schools offer and then ask "students who make poor choices to suffer a lifetime of responsibility" (p. 160). (2) The focus is on the group rather than the individual. "Catholic schools direct their attention to the

social rather than the individual basis of human engagement" (p. 161), which promotes a cohesive sense of community within them. (3) Education is explicitly treated as a cultural and moral enterprise. Some of this has religious undertones, but the general point can be considered in more secular terms: "Catholic schools define education in terms of forming the conscience of all students toward and awareness of what they share in common" (p. 162). Much within these conclusions presents a fairly stark contrast with the *modus operandi* of the public school and those who defend it as well as with many of the individualistic, market-based arguments scattered through other essays in the book. Lee's essay is among the shortest, but it is one of the more provocative intellectual contributions of the volume.

Other essays are less satisfying but still make a worthwhile read. John Chubb's contribution is an insider's explanation of the trials and tribulations of the Edison Project, the private education company and brainchild of entrepreneur Chris Whittle. Edison arrived with a bang, with much-discussed plans to open a national chain of private schools, revolutionize the delivery of education services, and do it all while making a profit. The actual record has fallen considerably short of this promise. The private school operation was largely abandoned in favor of seeking contracts to run public schools, a move with mixed results. Edison's "redesign" of pedagogy and administration has been dismissed by critics as a lengthy and expensive effort that describes what is already accepted as good practice. And even a charitable capitalist has to concede that Edison has had a hard time making money for its investors. To his credit, Chubb ducks none of this and puts up a spirited and detailed counter. He offers a solid defense of Edison's record and provides a particularly lucid portrayal of the organization's willingness to experiment and take chances. Still, one can be excused for wondering why advocates of market-based reform such as Chubb are not quite as forgiving of setbacks and missteps in public operations as they are in private ones. It would be unfair to characterize Chubb's essay as an apologist's exercise, but it is also accurate to say that a number of the "I-told-you-so" crowd of public school defenders are going to interpret it on exactly those terms.

A handful of the essays have a highly partisan tone that seems to crowd out common ground between opposing sides of the reform debate. An example is the essay on Milwaukee's school choice experiment by Paul E. Peterson and Chad Noyes. The essay is outlined by borrowing Dante's description of Hell's circles and describes a program that succeeded despite being sabotaged by scheming choice opponents from the beginning. Perhaps a supportable perspective on the Milwaukee program but less inflammatory interpretations and less absolutist conclusions would be more defensible. The essay also disappoints because it takes the opportunity to renew an unpleasant exchange between Peterson and John Witte. Witte, of the University of Wisconsin-Madison, was the primary evaluator of the Milwaukee choice program, and he collected and analyzed data in a series of annual reports. Along with a series of colleagues, of whom Noyes is the latest, Peterson in a number of forums has all but charged Witte (unfairly, in my own opinion) of being a stooge of antichoice ideologues, with specific accusations running from bad science to unwarranted embargoing of data. The essay's section on evaluation begins with Dante's eighth circle, where "the practitioners of deceit and fraud" are found, and follows with barbs like "an acrid stench surrounds the manner in which the evaluator was selected" (p. 133). While many in the choice exchange (including myself) have contributed to the heat of this debate, beyond some point hostile semantic

broadside become counterproductive. The fact that the essay mostly avoids the pointed methodological critiques made of Peterson's reevaluations of Witte's work adds to the general impression that this essay is very close to crossing that point.

The bottom line on this book is that, agree or not, and I suspect most readers will do both depending on the essay, taken as a whole it provides a provocative and stimulating intellectual ride. Ravitch and coeditor Joseph P. Viteritti have put together a volume which, regardless of its audience, will serve to "stir things up." This, I strongly suspect, was their primary motivation and hope. As such, they are to be commended; the book stands as a notable success on these terms and is highly recommended.

Narratives of Justice: Legislators' Beliefs about Distributive Justice. By Grant Reeher. Ann Arbor: University of Michigan Press, 1996. 338p. \$21.95.

Paul Schumaker, *University of Kansas*

Drawing on in-depth interviews conducted in 1988 with 35 state senators from Connecticut, Grant Reeher provides an impressive and engaging account of elite belief systems, focusing on attitudes concerning the distribution of material goods. Reeher argues that these senators form three distinct ideological types, and the central chapters of his book are devoted to describing "narratives" containing the beliefs of "Critics," "Supporters," and "Ambivalents."

Critics, who comprised nine of the senators, hold a variety of ideas that depart from American orthodoxy. First, they believe that the lower class is a victim of power plays by the wealthy to maximize profits. Second, Critics embrace the distributional principle "to each according to his (or her) needs." While recognizing the importance of incentives and desert-based principles of justice, they critically evaluate those institutions and practices that fail to provide the disadvantaged with essential economic, psychological, and social resources. Third, Critics seek transformations in human psychology. Believing that unjust distributions are rooted in human greed, fear, and hatred (especially as these are manifested racially), they stress instilling empathy and compassion, especially through integrated education. Fourth, Critics see the "government as hero" primarily because of its capacity to achieve some equalization through progressive taxes.

Supporters, who comprised seven of the senators, hold views that are opposite the main beliefs of the Critics. First, Supporters doubt that the lower class is a victim and believe instead that the path of upward mobility is open to all. Second, downplaying "need" as a basis of just distribution, Supporters endorse the market as a distributor of economic goods because its allocations reflect merit and desert. Third, Supporters seek a transformation in human psychology different from that sought by Critics. Believing that people fail in the capitalist system because of personal vices, they seek to instill motivation, character, and self-reliance. Fourth, Supporters see "government as villain" and believe that its redistributive policies corrupt self-reliance and the efficiency of the market. By calling for major changes in human character and by seeking a minimal state, Supporters are, according to Reeher, as "profoundly reformist" as Critics.

Nineteen of the senators were classified as Ambivalents, whose ideas are shaped by a perception of difficult trade-offs between such things as economic efficiency and equality. Recognizing strengths and weaknesses in both market and government, Ambivalents seek technical and incremental

adjustments to the status quo rather than profound reforms. First, they view capitalism as better than all other economic systems, but they recognize that it fails to provide mobility and opportunity for those who are unprepared to participate in it. Second, Ambivalents emphasize that the key to economic fairness is "accessibility and impartiality." Economic growth is seen as vital because it provides the disadvantaged access to economic opportunities. Market-driven inequalities are seen as impartial and thus justified if based on criteria like ability and effort, but unjustified market distributions are perceived. Third, Ambivalents seek lesser transformations in human nature than do Critics and Supporters. Rather than hope that people will lose their selfishness or that they will acquire impeccable characters, Ambivalents are satisfied with providing individuals with an education that increases their efficacy and enhances their skills. Fourth, Ambivalents see government as neither hero nor villain, but as a public agency that can marginally enhance opportunity, especially through strong civil rights laws and extensive early education.

Reeher seeks to make several contributions beyond describing these three worldviews. First, his work suggests that his typology will better contribute to empirical and normative theories of ideologies than do conventional classification schemes involving various forms of conservatism, liberalism, and socialism. This suggestion is plausible if people's concerns about the distribution of material goods dominate their political thinking and action, as justice principles play a more central role in Reeher's typology than they play in most other characterizations of ideologies. But Reeher's useful comparisons among the views of Critics, Supporters, Ambivalents and people holding more conventional ideologies fall short of the kind of analysis that demonstrates the superiority of his classification scheme.

Second, Reeher seeks to establish the relevance of the normative beliefs of policymakers to the legislation they produce. Most paradigms of policymaking ignore or downplay the importance of the justice principles held by decision makers, but Reeher examined three policy issues that arose in Connecticut at the time of his interviews (educational finance, property tax relief, and plant closings) to analyze the effects of legislators' beliefs on their policies. Arguing that beliefs are "filters," he provides an important discussion of how legislators' belief systems enhance or reduce the effect of those factors that are normally studied as the prime influences on policymaking—such things as party and constituency influences and the role of interstate competition for business. While this discussion is provocative, the reader may also wonder when and how legislators go about directly acting on their justice principles. While Reeher provides an interesting analysis of why Critics are deterred from acting directly on their justice principles (they overestimate their political isolation), it would have been equally interesting to examine the opportunities that legislators perceive for pursuing these beliefs.

Third, Reeher seeks to demonstrate the value of "narratives" in conducting and presenting research on political belief systems. The approach solicits stories about specific events and people from respondents and then uses these stories to discern the respondent's abstract beliefs and values. Reeher suggests that the narratives told to him by the senators enable a better understanding of ideologies than do responses to survey questionnaires, the approach that has thus far dominated empirical research on belief systems. Judging from the extracts of the interviews provided, however, Reeher did not collect and analyze narratives, understood as stories. Instead, he asked his respondents to provide answers to an impressive array of abstract questions, and they

usually provided abstract ideas, rather than stories, as their answers. Thus, Reeher's work may show that ideologies are better studied through open-ended interviews than through fixed-response survey instruments, but his study does not demonstrate the value of narratives in collecting data on belief systems.

Narratives can also be understood as expository devices for portraying various belief systems, and it is this use of narrative that Reeher most effectively employs. From the interview data, he has constructed three distinct narratives or stories, each "with a plot and a cast of characters possessing certain qualities... [that] both explain and judge perceived outcomes" (p. 249). Reeher believes that these products of his research might facilitate better normative evaluations because humans seem better able to judge the merits of competing narratives than the merits of competing abstract principles of justice. In this regard, he suggests that narratives may be more persuasive than philosophical arguments. Thus, the case for more economic equality—which remains murky given the incommensurability of competing philosophies of justice—may become more apparent if one compares the merits of the Critic's narrative with that of the Supporter. Again, this claim seems plausible. Figuring out a valid method for testing this claim would be an interesting and important future development in Reeher's approach to understanding distributive justice.

Public Spirit in the Thrift Tragedy. By Mark Carl Rom. Pittsburgh, PA: University of Pittsburgh Press, 1996. 326p. \$49.95 cloth, \$22.95 paper.

Gary Mucciaroni, *Temple University*

The spectacular failure of the savings and loan industry during the 1980s, resulting in losses to taxpayers of approximately \$180 billion, is the subject of this volume by Mark Carl Rom. It will undoubtedly become the definitive work in political science on what is believed by many to be the most significant public policy fiasco of recent memory.

Few policy areas are as complicated and full of technicalities as this one. Rom's presentation of the case, guiding us through the arcane worlds of financial regulation, banking, and accounting, is as lucid as can be expected from any scholar. The volume begins with a literature review, a summary of the main argument, and a brief history of the S & L business and policy commitments related to it. The bulk of the book is split between an investigation of the role of regulatory agencies and that of Congress in the saga.

Rom's interpretation of the thrift tragedy is refreshing, plausible, and consistent with the considerable evidence that he musters. His thesis is that the thrift tragedy occurred despite the effort of policymakers to act in the public interest and even because of it. Therefore, self-interest alone is "a woefully inadequate explanation of official behavior and policy choice" (p. 9). The argument is provocative and unconventional given that journalistic and academic accounts of the thrift tragedy typically attribute it to fraud, perverse political incentives, institutional incompetence, or some combination. The volume also adds to a burgeoning literature that brings deliberation back into the study of policymaking and challenges the public choice assumption that political behavior is rooted in narrow self-interest.

Rom traces about half of the thrift losses to policy choices that were made before the deregulation of the 1980s. To help homeowners and thrifts finance housing and create savings, Congress deliberately encouraged the industry to make long-term, fixed-rate home mortgage loans and to accept interest

rate ceilings and short-term deposits backed by federal deposit insurance. Eventually these policy commitments left thrifts vulnerable to sharp increases in interest rates in the 1970s, which aggravated the "mismatch" between what the thrifts could earn on their fixed mortgages and what they needed to pay to attract deposits. Under deregulation, the losses increased substantially because S & Ls were empowered to pay whatever they wished for funds and to invest in projects, many of which were highly risky and in which thrifts had no experience. Again, however, Rom argues that "these policies were adopted to benefit the public by making homes affordable, savings safe, and thrifts stable" (p. 211). The fact that the overwhelming preponderance of opinion, including that of independent experts, supported deregulation at the time it was considered adds force to his argument. Critics have argued that the crisis was needlessly exacerbated by policymakers' failures to respond to the crisis more swiftly. Rom counters that policymakers were on the horns of a dilemma. The issues were complex and arcane, often without clear or readily available solutions until it was already too late. "In general," he concludes, policymakers "decided cautiously when no consensus existed and quickly when one did: they deliberated when the solutions were not clear and acted when they were" (p. 211).

Rom cannot be accused of shying away from making startling pronouncements. In objecting to terms like "fiasco" as hyperbolic and contending that the thrift crisis was "hardly disastrous," Rom is bound to raise more than a few eyebrows. The argument that other dubious government programs have cost taxpayers lots of money, too, but have received less attention than the thrift crisis is a weak one that ends up sounding like two wrongs make a right. Suggesting that most people probably find a massive bailout for depositors (whose money was squandered in many instances through incompetence, greed, and fraud) as no worse than the mortgage interest deduction seems improbable and constitutes an odd comparison of apples with oranges.

In offering an alternative interpretation of the thrift crisis, Rom concedes that he is not conducting "unequivocal hypothesis tests between the two approaches [i.e., self-interest versus public spirit]" (p. 20). Indeed, it is one thing to show that policymakers made decisions that were reasonable on the merits, given competing policy goals, limited information, and time constraints. It is another to demonstrate convincingly that those decisions resulted from policymakers being motivated by one goal rather than another. Self-interested goals and the desire to make good policy are not mutually exclusive. Moreover, without being able to read policymakers' minds, it is far from clear in many or most instances which goal is paramount. One can usually find policymakers' choices congruent with some plausible self-interest motive like reelection, power, or prestige. Did Congress refuse to adopt adjustable rate mortgages (a decision that undoubtedly contributed to the thrift tragedy) because it saw it as electorally advantageous to side with realtors, home builders, consumer groups, and the homeowner-voters who preferred fixed rates? Or did legislators do so because they thought that it was more in the public interest to protect homeowners from interest rate risk and save them billions of dollars, rather than the thrifts? Similarly, did Congress adopt asset deregulation in response to industry pressure or because there existed a broad and deep consensus that asset deregulation was a good thing? Or was there a combination of motivations at work in these cases? Rom admits that he cannot pin down motives, and so he develops other criteria for making empirical comparisons between the public choice and public spirit perspectives. These have to do with institu-

tional structure, resources, deliberative effort, and other aspects of the policymaking process. But these are not sufficiently refined and unambiguous to test his contention that self-interested behavior played only a residual role in this case.

If Rom's interpretation is correct, then it confirms the notion that good intentions are not enough to avoid costly, unintended consequences. (One crucial question is how much, if at all, does public spiritedness help to reduce or avoid such consequences compared to self-interest?) Policymakers also need to be smart. Yet, high levels of uncertainty are intrinsic to many policy issues, regardless of policymakers' willingness and capacity for deliberating on the merits. Even when uncertainty can be theoretically reduced, the resources available to overcome uncertainty and reduce error may be insufficient.

Readers may take away from Rom a message that is at the same time reassuring and disconcerting: We have less reason to worry about policymakers' motives and incentives than cynical perspectives on American politics would have us believe, but we have more reason to be concerned about our capacity to gain control over an environment that demands timely answers to complex problems, and whose solutions are uncertain or pit one desirable goal against others.

The American Presidency under Siege. By Gary L. Rose. Albany: State University of New York Press, 1997. 231p. \$18.95.

James P. Pfiffner, *George Mason University*

The premise of this book is that the contemporary presidency is under siege from a number of debilitating factors that have developed over the past 25 years and that it is "incapable of creative leadership" (p. xii). Rose presents a well-written, solid analysis of recent presidencies, despite several potential flaws in the overall argument. The first two chapters lay out many of the symptoms of the problem. Presidents are hemmed in by "a monstrous and behemoth-like federal bureaucracy capable of thwarting the implementation of presidential policy, a viperous and tabloid mass media with an insatiable thirst for scandal in the White House and a Congress . . . fully determined to constrain the powers of the presidency" (p. 14).

Chapter 3 presents the heart of Rose's analysis. The deterioration of presidential power has been caused primarily by the decline of political parties in the United States, beginning with the proliferation of primary elections. His historical and developmental analysis is quite good and brings together much of the best political science literature on political parties and their decline over the past several decades. Rose concludes that "the relentless onslaught of anti-party forces throughout the twentieth century" results in an individualized presidential selection process so that presidents in office do not have the necessary support or leverage to enact the policies they want. "It is this condition that explains the failure of recent American presidents" (p. 68).

The core of Rose's solution to the problem of presidential leadership is presented in a chapter on political party reform. He argues that reestablishing the clout of political parties will restore the power and prestige of the presidency. He argues for returning control of presidential nominations to those most committed and able to make wise choices, that is, party regulars and activists, supplemented by rank-and-file party members. He would set aside up to one-third of public campaign financing for the parties, allocate free air time for party advertising, tighten lobbying and revolving door regu-

lations, and further insulate political parties from state control.

While arguing that stronger political parties are most important, Rose says that some legal and constitutional changes are also necessary: cutting the "unaccountable and autonomous" (p. 129) White House staff, giving the president greater reorganization authority, repealing the 22 Amendment, and giving the president the item veto. One of his more controversial reform proposals to strengthen the political parties is to give the president "at least one hundred thousand" (p. 113) political appointments to help him control the executive branch, rather than the current 3,000. Rose begins with the premise (without citing examples) that presidents are continually thwarted by intransigent bureaucracies. But if "the bureaucracy" is so strong and invincible, how was President Reagan able to cut domestic programs so severely in 1981? How was President Bush able to cut defense so sharply in the late 1980s? How was President Clinton able to cut the federal workforce by 300,000 in the mid-1990s?

Transition recruitment of political personnel is a slow-moving administrative nightmare as attested to by professionals from both parties. Increasing by even a small amount the number of people to be recruited, screened, and appointed would overwhelm an already overloaded system, let alone the problem of Senate confirmation of the increased numbers. Introducing 100,000 new political appointees, however competent, who must be trained every four years is a prescription for administrative disaster.

Rose's overall argument is that (1) presidential leadership is crucial, (2) more presidential power is necessary for that leadership, and (3) stronger political parties along with more formal power can restore the presidency. One could grant the first point and admit that parties were an important component of presidential leadership before the 1960s but still reject points two and three.

Rose's analysis of the factors that make current presidents' jobs more frustrating—such as weaker parties, hostile media, declining public support, and a contentious Congress—is convincing and well grounded in the political science literature. But whether these factors are as debilitating as he asserts is arguable. Each of the contemporary presidents he cites won some important policy victories, even if they are not now seen as "near great." But neither was Harry Truman or Dwight Eisenhower in his time.

Even more arguable is whether a return to strong parties would result from his reform proposals, or if parties were to become stronger (as they are in the use of soft money and party voting in Congress), whether it would result in a stronger presidency. Other factors, such as the U.S. role in the world, a hostile press, and a skeptical public, would probably not allow a return to Rose's ideal age of more than three decades ago. But this does not mean that great presidents are no longer possible. Great presidential leadership depends upon an exceptional individual, a certain level of policy consensus, wise policies, and, some would argue, a crisis to confront.

More broadly speaking, whether the problems facing the presidency are primarily the product of the past 25 years, as Rose argues, is open to question. Other scholars, in examining the same presidencies and problems that Rose documents, present different perspectives on presidential leadership. Historian Arthur Schlesinger, rejecting structural and institutional remedies, argues that there is nothing wrong with presidential leadership that better presidents cannot cure. He argues that good leadership will overcome the systemic obstacles to consensus as past great presidents have.

Political scientists Charles O. Jones and David Mayhew

reject a presidentialist perspective and argue that we should be less concerned about how presidents fare and more concerned with how the political *system*, particularly the interaction between president and Congress, deals with national policy problems. In contrast to Rose's claim that the Framers intended a strong presidency, Richard Neustadt based his analysis of presidential power on the premise that the presidency is in an inherently weak position in the U.S. system.

While some of Rose's arguments are open to question, this is nevertheless a very good book. It lays out in detail a careful, reasoned analysis of problems of the contemporary presidency and a coherent program of reform designed to restore presidential vitality. One of the not insignificant contributions is its "executivist" argument for more presidential power that is not based in partisan frustration. It is rather, a reasoned argument based on a philosophical conviction that the U.S. political system has moved away from (what Rose contends was) the Framers' intention for a strong presidency and on an analysis of contemporary public policy problems that Rose argues would be better solved if political parties were restored and the presidency strengthened. One can disagree with both the philosophical underpinnings and prescriptions and still admit that this is a fine book and a well-made argument.

Medicaid and the Limits of State Health Reform. By Michael S. Sparer. Philadelphia, PA: Temple University Press, 1996. 235p. \$54.95 cloth, \$19.95 paper.

Pauline Vaillancourt Rosenau, *University of Texas*

Today, the federal-state balance leans to the states, and in the absence of national leadership on health policy, the states have gone in different directions. Michael Sparer offers a much needed balance to the one-sided, state-oriented "devolution-revolution" approach to public policy. He argues that, while significant authority over health policy had been given to the states in the past, the results were far from successful. This conclusion is not based on ideology or philosophy so much as on careful consideration of a critical health policy arena—Medicaid. We learn in this volume that state public policies may have serious consequences for residents, that policies vary dramatically across states, and that some states fail their populations altogether.

I would use this book as a text in any public policy course. It is well organized and tightly written. It is a blessedly short book, to the point. The prose is clear and lucid. The text never wanders, and little energy is wasted on what is not pertinent. The author synthesizes enormous amounts of background material for all 50 states in a concise fashion. He examines variations in Medicaid policy across the states, reconciling conflicting findings, drawing in historical material where relevant, and never forgetting that the political culture of each state is different.

A comparative study of Medicaid in California and New York is presented with four in-depth case studies in each state: nursing home policy, home care policy, hospital policy, and managed care policy. The author aptly ties the difference between Medicaid policy in California and New York to the debate about who governs and whether policy is society centered (high interest group input, as in New York) or state centered (state bureaucrats hold power, as in California). The conclusion is that there is no single answer to the question of "who governs?" The response varies from state to state and from one policy arena to another.

The health policy choices that citizens and governments

must make are clearly described in this book. They are, in short, summarized by a poster that Tom Bodenheimer observed in the office of an Oregon Health Plan administrator: "Cost, access, quality—pick any two" (cited in "The Oregon Health Plan—Lessons for the Nation," *New England Journal of Medicine*, September 4, 1997, p. 723). From Sparer's analysis it appears that California chose *cost and access* while New York chose *quality and access*. Two states, two different ways of making Medicaid policy; but neither does a very good job. Fraud and abuse coexist with New York's generous programs (pp. 96–7; 121–2); quality compromises plague California's attempt to manage Medicaid. The variation between these states reflects the huge differences that exist across the nation.

Medicaid and the Limits of State Health Reform is likely to remain relevant in the future, perhaps even more than its author and publisher could possibly have anticipated. The 1997 Balanced Budget bill and its Children's Health Insurance Program offer states a great deal of flexibility and responsibility as to how federal requirements are met, how funds are allocated, and how programs are actually administered. Last year the Health Insurance Portability and Accountability Act of 1996 (HIPAA) gave states leeway as to what to do with people who move from a job with health insurance to one with no employer-sponsored coverage. The law does not require that insurance companies provide equivalent coverage. Rather, it permits states to put such individuals into high-cost, limited-benefit risk pools. But is this portability? Each state is a laboratory, but the bottom line is that the states are also testing grounds for private interests who opposed legislation at the federal level and who seek implementation loopholes at the state level.

This book gives pause as to the future, however, for another reason that could not have been predicted. There is a generally positive economic climate today (low inflation and low unemployment). Everyone is hard at work, and that includes many who used to depend on Medicaid. Many states appear to be managing programs better, including Medicaid, when in fact they are merely profiting from events that are beyond their control. States find it easier to balance their budgets because more citizens are employed and therefore paying taxes. Thus, the states have higher than expected revenues and fewer unemployed poor seeking Medicaid eligibility. Those forced off welfare find it easier to find a job in a growing economy. But there is no guarantee as to how long this best-of-all-possible-worlds will last. If the economy turns around, unemployment rates may increase, and there will be greater demand for Medicaid at the same time that the states face lower overall revenues because the unemployed do not pay taxes. A crisis of enormous proportions is likely to ensue, and the states will face hard choices, such as those outlined in this book. They can toughen up eligibility for the Medicaid program, or they can follow the example of California, where state Medicaid administrators offered a cost-control deal that nursing homes could not resist: Accept low reimbursement rates in return for superficial attention to quality oversight by state inspectors (p. 193).

I was left with only one question about Medicaid policy after reading this book. Political parties and their accompanying ideologies are not directly included as explanatory variables. I cannot help but wonder if New York's historically more generous Medicaid benefits (\$7,286 per beneficiary) reflect, in part, that state's Democratic Party heritage. Does California's lower Medicaid expenditure (\$2,801 per beneficiary) mean that tight-fisted bureaucrats left over from the Reagan years still disproportionately populate officialdom and implement their political point of view thanks to the

considerable bureaucratic autonomy existing in that political culture?

Perhaps the most important conclusion from this book is that if cost containment is the first priority for health policy, this requires "bureaucratic centralization not interest-group politics" (p. 197). This mechanism for controlling costs remains unpopular in the United States today because it acquiesces to federal government power over the states. Instead, we have turned by default to marketplace reform and competition. The market, as much as Congress, makes health policy today. With only four or five years of experience behind us now, it appears that this approach is failing to bring health costs into line with those observed in other industrialized countries. Apparent failure, however, does not seem to dampen enthusiasm for the market—at least not yet.

The Politics of Social Welfare: The Collapse of the Center and the Rise of the Right. By Alex Waddan. Cheltenham, UK, and Brookfields, VT: Edward Elgar, 1997. 204p. \$70.00.

Stathis N. Kalyvas, *New York University*

How did the Right win the battle of ideas surrounding the welfare state? How did liberals allow the debate to shift from social justice and poverty to dependency? In other words, how did important parts of New Right ideology permeate the liberal consciousness and become established parts of the conventional wisdom? This book discusses the rise and crisis of the welfare state in the United States and offers an argument explaining the ideological defeat of pro-welfare liberals by the Right. It provides a detailed overview of welfare state-building, beginning with President Johnson's War on Poverty (particularly the Economic Opportunity Act), including numerous defeated initiatives, such as President Nixon's NIT (Negative Income Tax) and FAP (Family Assistance Plan), and President Carter's PBJI (Program for Better Jobs and Income). The book's twin focus is on social policy and the ideological context in which social policy was conceived and implemented.

Waddan is particularly keen on explaining "the open and agonizing nature of the collapse of faith in the capacity of social welfare liberalism to provide solutions" (p. 46). The central argument is that the way in which the welfare state was built in the 1960s undermined its future: The model underpinning it was in the long term not a viable one; whatever its merits, it could not last. Overoptimistic and naive liberal reformers defined poverty in a self-defeating way conducive to political and ideological confusion. Overall expectations surrounding the War on Poverty were unrealistic. A philosophical ambiguity and an ad hoc nature seemed to permeate the whole effort. The demise of the welfare state was built in, so to speak, from the very beginning and in its very core. Even when pro-welfare ideas enjoyed a political hegemony, Waddan argues, there was little consideration of the long-term implications of welfare policies. While governments engaged in the correction of identifiable social wrongs, there was either an unwillingness or an inability to think through the possible implications of each incremental measure, an absence of reflection about the societal costs imposed by welfare policies, and a reluctance to assume these costs and implement adequate reforms.

An example of how the unrealistic expectations of liberal reformers hurt their long-term goals is seen the way in which they sabotaged the Nixon era reforms, particularly the FAP, thus missing an opportunity to fortify a philosophy committing government to help the poor under virtually any circum-

stances. Welfare measures slogged along in a haphazard way: No real integrated structure was created, while the continued expansion of welfare rolls was not followed by a rationalization of the system. The fragmented nature of the welfare structure, particularly its residual-type elements, made it an easy target for opponents. As a result, when welfare policies met with the fiscal pressures stemming from the economic dislocations of the 1970s, particularly the recession of 1979–80, they were promptly defeated on the ideological front. It was an easy task for the New Right to connect the issue of taxation with the notion of the undeserving poor, turn poverty into dependency on welfare, and drive home its point that welfare programs undermined both the health of the overall economy and the dignity of the individual.

Although this is an interesting and plausible argument, it is just that: an argument. No competing explanations are offered, no alternative hypotheses examined. Indeed, Waddan readily acknowledges that his book is "essentially a commentary" on the crisis of the welfare state in the United States (p. 9). He does not make any particular effort to convince the reader why his argument is more valid than others that have been (or can be) advanced to explain the same phenomenon. Moreover, even the causal mechanisms underpinning his argument are never specified: They are vague and shifting. A comparative framework could have helped in this respect (in fact, the book's title is misleading: its subject matter is the politics of social welfare *in the United States*). Although Waddan claims that the American case is a valuable guide to the problems encountered by the European welfare states, he takes a stand in favor of U.S. exceptionalism: "Clearly developments in the US cannot be divorced from the country's particularly idiosyncratic historical approach to social welfare issues; and obviously this tradition helps to explain why American liberalism has suffered such a spectacular and painful crisis of confidence" (p. 3). He then points out (p. 172), however, that the "relatively weak collectivist traditions" of the United States do "not fully explain quite why liberal advocates were so badly beaten." This vagueness underlines the absence of a rigorous specification of the central hypothesis. A related but more serious problem is the absence of theory from the analysis. Even though Waddan refers to welfare state theories (such as Offe's and Esping-Andersen's) at the beginning and the end of the book, he makes no systematic attempt to connect his argument to these theories. On a more general level, while he makes several implicit assumptions about the role of ideas in the success or failure of social policies, there is no explicit theoretical discussion of either the role of ideas in policy-making or the interaction between ideas, interests, and structures; Waddan seems to ignore the thriving relevant debates.

The absence of original data, a research design, and a theoretical framework turns this book into a purely descriptive account of the politics of social welfare in the United States. It is certainly possible to argue that descriptive works do not require a full-fledged research design and theoretical framework; however, the presence of many implicit and explicit causal claims in the analysis interferes with the description. Although this book could serve as both a factual reference and a commentary on welfare politics in the United States, it is hardly the only one in the market. After all, the author himself suggests (p. 29) a book which, he claims, provides a lengthier and more comprehensive account of interpretations about the origins and long-term development of the welfare state than his.

Don't Burn It Here: Grassroots Challenges to Trash Incinerators. By Edward J. Walsh, Rex Warland, and D. Clayton Smith. University Park: Pennsylvania State University Press, 1997. 292p. \$50 cloth, \$17.95 paper.

A. B. Villanueva, *Western Illinois University*

As more social scientists with their sophisticated research methods get involved in the study of the environment, they provide us with fresh insights on the dynamics of citizen groups who play the role of private attorneys general for the environment in the public interest. Out of their research emerges data showing that what was usually taken for granted, as valid generalization about the relationship between democratic practices and environmental outcomes turns out to have no empirical support. As the findings of this research have demonstrated, there is no "positive relationship between democratic processes and successful sitings" (p. x) of mass-burning incinerators. Moreover, demographic characteristics of communities in which siting controversies occurred were not as significant in determining the success or failure of siting proposals as previously reported in the literature of municipal solid-waste management. What appears to be a more accurate predictor of siting outcomes is the existence of cleavages among political elites who support the construction of incinerators in the hope of transforming garbage to gold, the involvement of environmental scientists with impeccable credentials supporting the opponents, and the manner in which the issues are framed by both sides of the debate.

Environmental protection bureaucracies have developed a hierarchy of waste-management policies in which volume reduction at the source lies at the top of the totem pole and disposal in landfill facilities at the bottom. The second most preferred technique is recycling and reuse. Combustion with energy recovery and combustion for volume reduction have low priority in the hierarchy. In practice, some county and local governments feel that more can be gained from an economic standpoint by burning trash rather than recycling waste. Environmental quality is evidently not taken into account at all in the decision-making process. The authors of this study correctly point out that a number of forces, such as the privatization policies of the Reagan administration, the energy crises of the 1970s, the flow-control ordinances of local governments (later declared by the Supreme Court as violations of the commerce clause), the increasing shortage of landfills, and the potential profit from this technology by financial lending institutions, set in motion the construction of mass-burning incinerators. Each factor contributed a great deal in the development of policies adopted by some counties and local governments to meet the garbage crisis.

To build or not to build an incinerator is a public policy question. As an issue of public concern, the political arena is replete with actors, including public officials, waste facility developers, consultants, and citizens, who have a negative perception of the effect of the project. These citizens form the core of an anti-incinerator movement aimed at nipping the siting proposal in the bud. The way they behave in the

political arena epitomizes direct democracy at work: gathering petitions, attending public hearings, proposing referendums, and threatening to recall elected leaders who turn a deaf ear to their demands. They also give nondecision makers, so popular in the literature on community power structure, a taste of their own medicine: preventing the incineration issue from getting into the policy agenda by bringing pressure to bear on those who control the agenda-setting process and delaying the implementation stage through litigation in the courts. In all the cases reported in this volume, opponents were successful in arousing public awareness of the incineration issue and equally successful in raising the level of its political saliency. Unlike the anti-environmental groups, whose objectives are to stop the government from promulgating regulations restricting their property rights, weaken the power of and influence their local governments, and call for a wise use of the public domain, the anti-incineration groups demand a change in the process and substance of public policy by lobbying local officials to consider other alternatives in the management of municipal solid wastes.

Advising both sides of the incineration debate on how to achieve success in making a case for or against siting proposals is tantamount to a politics of avoidance (pp. 260-2). It is not helpful and useful to policymakers at all in their quest for a politically acceptable and environmentally benign solution to the disposal of trash. There are viable, cost-effective, and environmentally sound alternatives, including recycling and pollution prevention. In their quest for ways to break the siting gridlock, policymakers must keep muddling through to prevent the nation from becoming a wasteland.

The task of crafting a policy of solid-waste management by county and municipal officials will be difficult, because alternatives to incineration are not panaceas to environmental pollution. Recycling cannot eliminate pollution. It can reduce it, but it does little to stop the generation of trash due to the insatiable appetite for consumer goods of a throw-away society. Similarly, pollution prevention is not the magic formula that can bring down pollution to a zero level. Policymakers who are working to make it a goal of environmental policy, desirable and sound as it is, are making promises they cannot deliver.

Environmental science will broaden its base if more research of this caliber is undertaken by social scientists. Additional case studies are needed to examine the relationships between citizens' perception of risks and their degree of opposition to the siting of a new technology, to show the effectiveness of citizen advisory committees in influencing siting outcomes, and to examine the referendum device as a means of resolving the siting conflict. Although this scholarship is the result of only a few case studies and barely scratched the surface of a vast area of environmental study, it is a step in the right direction. Interdisciplinary programs in environmental studies will find this piece of scholarship an invaluable contribution of political sociology to the literature on citizen participation in the environmental policy process.

Comparative Politics

Iranian Intellectuals and the West: The Tormented Triumph of Nativism. By Mehrzad Boroujerdi. Syracuse, NY: Syracuse University Press, 1996. 256p. \$45.00 cloth, \$16.95 paper.

Gawdat Bahgat, *Indiana University of Pennsylvania*

Unlike many developing countries, Iran has never been under foreign occupation for a long period. But, like many other Muslim states, the Iranian culture has experienced close contact with Western civilization, particularly since the beginning of the twentieth century. In 1908, oil was discovered in commercial quantities and has since accelerated the country's integration into the international system. In the mid-1920s, Reza Khan ended the reign of the Qajar dynasty (1794–1925) and established the Pahlavi regime (1925–79). Like Kemal Atatürk in neighboring Turkey, Khan was eager to adopt Western values, albeit with less success. In September 1941 Khan abdicated in favor of his son Muhammad, who was more enthusiastic in opening Iran's doors to Western technology and values. This uneasy process of interacting between two cultural systems is the subject of Boroujerdi's work.

In order to explain the indigenous response to the perceived external cultural attack, the book seeks to present an integrated analysis of the socioeconomic and cultural transformation of Iranian society in the last five decades. Given the fact that the work of intellectuals represents the public conscience, the author examines the writings of ten scholars: Seyyed Fakhroddin Shadman, Ahmad Fardid, Jalal Al-Ahmad, Ali Shari'ati, Seyyed Hoseyn Nasr, Ehsan Naraqi, Hamid Enayat, Daryush Shayegan, Reza Davari, and Abdolkarim Soroush. They come from different academic disciplines and suggest a variety of approaches for dealing with the West. Two common denominators can be identified in their work, however. First, there is a strong emphasis on authenticity, or what Boroujerdi calls "nativism" (the doctrine that calls for the resurgence, reinstatement, or continuance of native cultural customs). Second, at the heart of this desire to stick to the traditions of Iranian nationalism is Islam and, more accurately, Shi'ism as it has been interpreted and practiced in Iran. Furthermore, there is a recognition of the need to keep Islam alive by introducing theoretical and organizational reform.

In addition to examining the cultural transformation in Iran as it has been portrayed in the work of ten leading intellectuals, the author briefly explores the socioeconomic settings that gave birth to their thought. An important characteristic of the Iranian economy is "rentierism." The concept was originally introduced to the growing literature of international economy almost three decades ago (Hossein Mahdavy, "The Patterns and Problems of Economic Development in Rentier States: The Case of Iran," in *Studies in the Economic History of the Middle East*, ed. M.A. Cook, 1970). It refers to any state that derives a substantial part of its revenue from foreign sources in the form of rent. Iran, like other OPEC members, has suffered from deep dependence on, and vulnerability to, oil as the major source of national income. The stagnated oil prices in the last several years have contributed to the decline of the standard of living for average citizens.

These deteriorated socioeconomic conditions added more challenges to the Iranian intellectuals. The basic question they tried to address was what is wrong with the indigenous system or, put another way, what is right with foreign, particularly Western, systems. In responding to this chal-

lenge, many scholars have shown strong appreciation for non-Western civilizations, such as the Japanese, Indian, and Russian. Others have advocated the separation between Western technology and values, that is, import the former and resist the latter. The mainstream Iranian intellectuals, however, have gone through a process of soul searching in which they found comfort in returning to the Iranian heritage. A fundamental question they had to answer was how to identify the "self." Some have found the roots in an Islamic Iran, and others have talked about pre-Islamic Persia. The revolution in 1979 reinforced the Islamic identity of Iran and simultaneously confronted the intellectuals with another major challenge: How does one create an Islamic economic and political model? The domestic and foreign policies of the Islamic Republic can be seen as an attempt by policymakers and intellectuals in Tehran to present an Islamic solution to the problems facing a rapidly modernizing society at the end of the twentieth century.

Boroujerdi's general survey of modern Iranian political thought highlights the significance of understanding the attempt by many developing countries to find a "compromise" between preserving their indigenous cultures and adopting Western values. It is important to point out, however, that the important contributions of the Shi'i Ulama (religious scholars) have not been examined in this work. Equally important, the ten intellectuals covered in this study are men. Women have also contributed to the richness of modern Iranian culture. In addition, the author does not explain his choice of time frame. The challenges of modernization have confronted Iranian society and intellectuals for a longer period than just the last five decades. Finally, there are very few references to similar experiences in other Muslim countries. For example, the work of Pakistani intellectuals (e.g., Abu'l-Ala Al Mawdudi, *How to Establish the Islamic State*, 1969), Egyptian writers (e.g., Taha Hussein, *The Future of Culture in Egypt*, 1938), and Iraqi scholars (e.g., Ayatollah Muhammad Baqir Al Sadr, *Our Economics*, 1982) show some similarities with and differences from the attempt made by their Iranian counterparts to find a common ground between nativism and Western values.

Public Management: The New Zealand Model. By Jonathan Boston, John Martin, June Pallot, and Pat Walsh. New York: Oxford University Press, 1996. 406p. \$65.00.

Social Policy in Aotearoa/New Zealand: A Critical Introduction. By Christine Cheyne, Mike O'Brien, and Michael Belgrave. New York: Oxford University Press, 1997. 282p. \$49.95.

Michael Mintrom, *Michigan State University*

New Zealand seems so far-flung. As the poet Charles Brash wrote in the 1940s, "distance looks our way." Yet, since 1984 the country has gone through unprecedented transformations in its politics and public policies, and those old distances have started to collapse. A close resemblance now exists between the problems and issues confronted by New Zealanders and those faced by politicians, policy elites, and citizens in other countries, as changing global forces press upon them. A comparative examination of similarities and differences across 15 countries, including New Zealand, is presented in John Williamson's edited collection, *The Political Economy of Policy Reform* (1993). Here, I review two recent studies of the New Zealand scene written by New Zealand academics.

Jonathan Boston, John Martin, June Pallot, and Pat Walsh provide an up-to-date survey of public sector reforms in New

Zealand since the mid-1980s. These include the establishment of state-owned enterprises, a comprehensive privatization program, sweeping changes to financial management across government entities, and decentralization of much operational decision making. These reforms, while introduced over ten years, all share consistent neoliberal theoretical underpinnings, and they can be said to be mutually reinforcing in the sense that all are designed to make the public sector operate more efficiently. The authors call this set of reforms the "New Zealand Model" and note that "this model has attracted widespread interest, and stimulated no little enthusiasm, among practitioners, scholars, and students of public management in many parts of the world" (p. vii). The intended audience for the book, therefore, appears to be an internationally diverse group of academics and policymakers; those people who are curious about the politics and practice of policy reform and who routinely scan beyond their immediate locale when searching for practical insights and intellectual provocation. For this audience, there is much of interest here, and the authors write with authority. Boston and his colleagues all have established records as chroniclers of the managerial changes that have taken place in New Zealand's public sector. They can legitimately claim to have stood at the epicenter of change, viewing reforms in the making.

In terms of its stated goal of thoroughly documenting the key features of the new public management in New Zealand, I judge the book a success. The chapters cover such topics as institutional design in the public sector, the organization and purchasing of policy advice, accountability and the collective interest, human resource management, and management in local government. My only complaint is that the goal of the book, documenting the New Zealand model, is a little too restrictive. Ironically, the very proximity that has given the authors their expert knowledge of the model also appears to have inhibited the development of a critical perspective. Why have these particular policies been adopted and not others? How sustainable over the longer term are they? What empirically oriented analytical techniques could be employed to evaluate their effectiveness? What features of New Zealand government and politics have rendered these policies unique and, consequently, reduced the potential for successful emulation elsewhere? We may forgive the authors for not addressing some of these questions. Remarkably, they appear reluctant even to raise them. Thus, the authors often come across as apologists for these reforms rather than as independent and intellectually inquisitive analysts. This limits the book's potential both as an enlightening text for students of public management and as a scholarly contribution.

Boston and his colleagues give little attention to the deliberate efforts at agenda setting that prepared the ground for introducing and developing the ideas of public management embodied in the New Zealand model. Moreover, the approaches that were most influential among policymakers as the model emerged (public choice theory, agency theory, transaction cost economics, and the grab-bag of buzzwords and fads going under the heading of "managerialism") are reviewed and critiqued in a surprisingly undigested fashion. Most interested readers will have at least a passing knowledge of the essential features of these approaches. Matters deserving more attention concern why and how these particular ideas were successfully forged into policy prescriptions that rapidly came to dominate (and subsequently transform) the local policy discourse in New Zealand.

A discussion of how the policy community came to fixate on some ideas and disregard others would provide important

clues as to whether the mutually reinforcing nature of the components of the model emerged by design or by sheer luck. Knowing about this process would also help us assess the likelihood that this model, or parts of it, could be successfully transplanted to other jurisdictions. But on this matter, the authors equivocate. "Assessing the influence of particular ideas, assumptions, theories, and models on a series of policy changes poses many difficulties. In any given policy setting there are usually numerous forces at work, not to mention a range of political, institutional, and technical constraints. In most situations, therefore, it is impossible to ascertain with any precision the impact of specific ideas, theoretical insights, or schools of thought on the process of policy development and implementation" (pp. 26-7). Sure, understanding the factors shaping social and political choices is difficult. That is why we do social science. The authors obviously have some knowledge about the war of position and the war of maneuver that occurred among policy advisors during the reform period. If they truly believe the conditions under which ideas and models gain influence are opaque, then I doubt that they would have taken the time to delineate so carefully the New Zealand model for readers elsewhere.

The title of *Social Policy in Aotearoa/New Zealand: A Critical Introduction*, may strike readers as unusual. "Aotearoa" is the Maori word for New Zealand (*literal meaning*: land of the long white cloud; *alternate meaning*: land of the wrong white crowd). In this book, the authors go to some length to argue that sound policy analysis starts with an examination of the broader social setting and a recognition that policy design involves trade-offs and rules that inevitably privilege some groups and disadvantage others. Cheyne and her colleagues seek to provide readers with the conceptual and critical tools necessary for understanding the forces that shape policy development. They also seek to promote broader public discussion of policy directions. These intentions alone are quite telling about the nature of the policy debate that has taken place in New Zealand since the mid-1980s. In their quest for reform, policy advisors and politicians have relied most heavily upon stripped-down economic models of human behavior to guide their thinking. Often, questions concerning how reforms will intermesh with those aspects of New Zealand life that are not amenable to inclusion in such models have been ignored. Nonetheless, these aspects—divergent conceptions of property rights, variegated understandings of appropriate behavior, and the importance that different groups place on nonmarket interactions and voluntarism—represent vital strands within the country's broader social fabric and affect significantly the well-being of individual citizens. In chapters on, among other things, feminist and antiracist conceptions of social policy, individualism, collectivism, and recognition of Maori self-determination, Cheyne and her colleagues lay the groundwork for developing a thorough critique of current policy settings in New Zealand.

Advocates of the New Zealand policy reforms have often, quite correctly, argued that trade and fiscal imbalances must be rectified for a sustainable position to obtain. Cheyne and her colleagues call for a rethinking of the various policy reforms that have affected income support, social services, and health care. To their credit, however, the authors acknowledge that the interactions between domestic policy settings and international economic conditions cannot be ignored. Thus, the essence of their argument is that policymakers should become alert to a broader range of conditions and considerations when engaging in policy development. Creative, nuanced thought, rather than slavish adherence to

received ideas or an obsessive focus on fiscal concerns, is what is most needed if policymakers are truly to advance general well-being.

These two books highlight New Zealand as a rich site for investigating many vital, contemporary questions regarding shifting configurations of politics, economics, government, and society. Aside from providing important discussions of distinct facets of public policy in New Zealand, both books offer extensive bibliographies. (The guides to further reading provided by Cheyne and her colleagues are particularly good.) Beyond the information contained in these books, readers interested in learning more about recent developments in New Zealand should consult two further sources: the summer 1997 issue of the *Journal of Policy Analysis and Management*, which is devoted entirely to drawing lessons for other countries from New Zealand's public management reforms; and Lewis Evans, Arthur Grimes, Bryce Wilkinson, and David Teece, "Economic Reform in New Zealand 1984-95: The Pursuit of Efficiency," *Journal of Economic Literature*, December 1996.

New States, New Politics: Building the Post-Soviet Nations.

Edited by Ian Bremmer and Ray Taras. Cambridge: Cambridge University Press, 1997. 743p. \$74.95 cloth, \$29.95 paper.

Paul Kubicek, *Koç University*

New States, New Politics is the successor to the editors' highly acclaimed *Nations and Politics in the Soviet Successor States* (1993). Many of the same distinguished contributors have been invited to share their assessments of the progress and shortcomings of nation- and state-building processes throughout the republics and regions of the former USSR. Their eighteen informative case studies, covering all fifteen states as well as specific regions within the Russian Federation, are bookended by essays by the editors that attempt to provide a framework by which to understand the development, evolution, and potential staying power of nationalism in the region.

While there is an almost inevitable resemblance to the previous work, there is much in *New States, New Politics* that is, in fact, new. All of the case studies have been updated to cover important events through 1994, and newly added chronologies at the end of each provide a handy additional resource for the reader. More significantly, however, the focus has changed with the course of events. Whereas the earlier volume largely chronicled the rise and eventual triumph of national emancipatory movements, this work's aim is to highlight problems of state-building and states' adjustment to independence. A central concern in all states, however, has been the effort to (re)define the nation—both in terms of itself and in relation to others—and to construct identities appropriate for the new states. In other words, the task now in many states is to remold and expand ethnically based conceptions of identity such as *russekii* or *kazak* into something based upon fealty to the state—a *rossiian* or a *kazakistanli*.

This is obviously not an easy task, one made all the more difficult by arduous economic and social conditions in all states. Nonetheless, its importance is easily demonstrated by the conspicuous examples of failure: civil wars in Chechnya, Georgia, Azerbaijan, and Moldova. Elsewhere there has been less violence between different ethnic and national groups, but tensions over questions of national identity and rights remain virtually omnipresent. Understanding the politics of nationalism and ethnicity therefore remains important

to the student of post-Soviet politics. Bremmer even suggests that an approach focusing on nationalism and national movements from below—as opposed to the classic state-centric focus—will capture more of the post-Soviet reality. He develops a multilayered typology of national movements and suggests that different groups will pursue policies of integration, domination, competition, or collusion depending upon their relative position.

The primary contribution of this volume, however, is in the case studies. In an average of twenty-five pages, each provides a history of national development, reviews the events leading to national independence, and highlights the main challenges confronting each of the new states or regions. Due to their relative brevity and their clarity, as well as the comprehensive coverage of the entire work, the cases will no doubt be a most useful guide for any student of post-Soviet politics.

As one might expect in an edited volume, however, there is little systematic effort to compare the experiences of different states, but the reader will quickly discover that there has not been one road to independence or one post-Soviet trajectory. Despite certain common traits, it is the differences among the Baltic, Slavic, Caucasian, and Central Asian states that stand out most clearly. This fact poses a real problem for those who want to develop schema or parsimonious theories to explain the dynamics of nationalism in post-Soviet states. Taras's effort to use Boolean analysis shows the difficulty of finding either necessary or sufficient conditions. The answer to the when, where, how, and why of nationalism seems to be, in short, that it depends. Bremmer's typology of interaction among various groups does capture some aspects of competition among groups, but clearly whether they compete or cooperate depends, again, upon a myriad of conditions. In some cases, one even sees that the push of realpolitik has superseded nationalism and now compels many states to enter into closer alliance with the center. Thus, we see Belarus, Kyrgyzstan, and Kazakhstan joining a customs union with Russia and Caucasian states seeking Russian assistance in ending the violence that torments the region.

This points to a larger problem with the work as a whole. The assumption seems to be that national identity and ethnic politics are ascendant and veritable trumps over all other issues. This is clearly not the case. In Lithuania, Ukraine, Moldova, and Georgia, the initial post-Soviet "nationalist" leaderships have been replaced by those adopting a more measured and pragmatic approach. In Central Asia there has been very little ethnic mobilization or "nationalism from below," as mentioned by Bremmer, and as a result the case studies tend to focus on state leaders and their efforts to consolidate their rule. Economics, the primary concern of post-Soviet publics, is disappointingly given spotty coverage in the text. For example, Kravchuk is lauded for his "successful" leadership in Ukraine, despite the fact that he presided over a precipitous economic collapse and by 1994 could run for reelection only a vacuous platform of "*Derzhavnist*" (statehood). In an even more puzzling oversight, the Communists' 1992 return to power in Lithuania is little more than mentioned. Both of these events, as well as numerous others, suggest that nationalist fervor may in fact be fading and that postindependence politics will not be governed exclusively or even primarily by issues of identity.

Is nationalism still ascendant? Should this in fact be the basis of a new paradigm? While no one can deny that nationalism and ethnic politics do matter and will remain a factor in post-Soviet politics, one may well wonder that as independence becomes both a memory and an accepted fact

what "normal politics" in these states will look like. Nationalist slogans may provide little practical guidance on such weighty questions as the role of government, how to resuscitate the economy, and where each state fits in the world community. In the case of Russia, we saw in 1996 that primitive nationalist appeals (as in the case of Zhirinovskiy) did not capture the imagination of the electorate. Yes, nationalist discourse was pervasive, but it fared better when combined with calls for greater economic security (Zyuganov) or law and order and cleaner politics (Lebed). In short, issues of national identity do constitute an important political cleavage in post-Soviet states, but others (class, age, region) are also crucial. Future volumes of this genre, therefore, may have to expand their focus if they want to document developments in post-Soviet states.

The Price of Wealth: Economies and Institutions in the Middle East. By Kiren Aziz Chaudhry. Ithaca, NY: Cornell University Press, 1997. 330p. \$45.00 cloth, \$19.95 paper.

Manochehr Dorraj, *Texas Christian University*

Amid a sea of descriptive and redundant accounts of Middle Eastern politics by instant "experts" and journalists that has appeared in the last two decades, Kiren Aziz Chaudhry's book is a life raft. Using a political economy approach, the author sets out to explain the institutional changes in Saudi Arabia and Yemen in the context of international and regional economies. Having analyzed the utility of international, institutional, and interest-based explanations of change in the comprehension of regional economies, she focuses on the central issues of economic development. Chaudhry delineates the rise of unified markets, the emergence of centralized bureaucracies, the role of petro-dollars and labor, and formal and informal banking in molding government-business relations and the overall development of these two political economies.

The author discerns three distinct formative periods in the economic and political development of Yemen and Saudi Arabia since 1970: the oil boom (1973–83), the recession (1984–1990), and the aftermath of the Gulf War (1991–97). The oil boom brought a huge influx of petro-dollars, which modified the regional economy fundamentally. The boom also functioned to further integrate the region into the global economy. During the boom years, the emergence of ideological politics in both countries was forestalled. The period of recession, when oil prices plummeted and budget constraints reduced state options, forced one to retrench (Saudi Arabia) and the other to grant concessions (Yemen). The Gulf War put an end to the regional economy, a process well underway since the 1980s, and magnified regional economic tensions, such as between the rich and the poor nations. Chaudhry also explains how the institutions built during the boom broke down during the bust.

Chaudhry's contribution is theoretically and empirically rich. It pays a great deal of attention to details, and the author's assertions and analysis are substantiated by abundant data and information. The two case studies are well chosen and enable useful comparisons and contrasts. Saudi Arabia is a rich economy based on petro-dollars, and its fortunes fluctuate with the price of oil. Yemen is a poor economy in which remittances from its out-migrant labor force and foreign aid received largely from the oil-producing states—Saudi Arabia in particular—play a large role in economic development.

The particular structure of the Saudi economy—single-commodity production, heavy reliance on oil, a negligible

goods-producing sector, and a small market and labor force—has led policymakers to infuse funds into the economy through expenditures on welfare programs, massive military spending, subsidies to the private sector, and a concentration on infrastructural development. Due to the weaknesses of the private sector and its primary involvement in nonproductive economic activities, government subsidies play a large role in supporting the farming and manufacturing industries, thus keeping the economy afloat. The oil boom of the 1970s and early 1980s followed by the oil bust of the late 1980s (Saudi oil revenues plummeted from \$120 billion in 1981 to \$17 billion in 1985) forced the government to implement an austerity program and cut back on subsidies for the private sector, policies that the private sector resisted and overturned. But due to its vast foreign reserves, the Saudi government managed to withstand the pressures of lower revenues and continued its high level of military and infrastructure expenditures.

Yemen's economy also was in crisis during the oil bust. Labor remittances dropped 60% in 1986. Foreign aid fell from more than 90% of the current budget to 2%. The government response was heavy taxation, regulation of the private sector, and reform of foreign trade. In Yemen, the weaknesses of central government have strengthened the tribal groups, who use their position of relative autonomy to bargain with the state. The Yemeni regime also initiated political liberalization, whereas the Saudi regime, facing an increasingly militant opposition by the 1990s, has retrenched and suppressed its opponents. The divergent responses to popular demands for participation may be explained in light of the fact that oil revenues had accrued directly to the Saudi government during the boom, releasing the state from reliance on domestic sources of revenue, whereas the privately controlled labor remittances bypassed the Yemeni state. Thus, not possessing the financial assets of the Saudi government, Yemen had to grant concessions and open the political system to wider participation.

While Chaudhry's economic analysis at times can be dry and is not always accompanied by corroborating political observations and conclusions, this volume offers more than enough to compensate for this minor weakness. A major strength of the book is that, by focusing on the nuances of institutional change and their outcomes, it goes beyond the traditional focus on political leaders and their personalities and policies. Chaudhry probes deeper than most, delineating the structural, national, and international factors responsible for changes in regional political economies. While she finds "a modified class analysis" useful in explaining the process of state formation and development of national markets, she is also aware of limitations of class analysis in understanding the internationalization of the two economies during the boom years. Her analysis is also sensitive to the specific realities of Saudi Arabia and Yemen, which are linked to their respective historical, cultural, and social development. This attention to specificity, however, does not detract from the breadth of generalizations and theorizing in this volume. In fact, in many ways, the author's analysis and observations go beyond her two case studies and provide insights that are helpful in understanding the complexities of Middle Eastern as well as Third World political economies. This leaves the reader wondering why, with the wealth of information and data presented in this volume, the author did not expand her research into a comparative study encompassing more countries. It is hoped that this will be a future project. Given the high quality of the present contribution, such an undertaking would be welcomed by students and scholars of the Middle East and Third World development alike.

Libya's Qaddafi: The Politics of Contradiction. By Mansour O. El-Kikhia. Gainesville: University Press of Florida, 1997. 213p. \$49.95.

Dirk Vandewalle, *Dartmouth College*

During the last decade, the literature on the rentier—or allocative or distributive—state has produced a growing number of works investigating the effect of commodity booms on the political and economic fortunes of numerous developing countries. Because of the extraordinary size and effect of hydrocarbons in several of those countries, oil exporters in particular have been the subject of intense—albeit often somewhat inconsistent and largely descriptive—studies. Two recent works (Terry Lynn Karl, *The Paradox of Plenty*, 1997, and Kiren Aziz Chaudhry, *The Price of Wealth*, 1997) synthesize many of those earlier findings in an interpretive and heuristic fashion that insightfully reveals how a combination of history, rapid inflows of revenues, and institutional development (or lack thereof) produces uniquely structured “petro-states.”

Arguably, no single country in the Middle East and North Africa has suffered more under the deleterious effect of that combination of factors than Libya. The legacy of a brutal colonial experience and the coincidence of state-building and sudden influx of exogenous capital saddled the country since its independence in 1951 with two rulers (Idris al-Sanusi and Muammar al-Qadhafi) whose often-voiced suspicions of the modern state, with its vertically integrated bureaucratic structures, exacerbated the tendency prevalent in most rentier states to use revenues in ways that are politically expedient but, most often, economically ruinous.

In *Libya's Qaddafi*, Mansour El-Kikhia aims to explain how precisely Libya's current ruler has accomplished the latter through what he defines as “the politics of contradiction” (p. 5): the creation of political turbulence and continual chaos that allows the regime to ensure its survival while effectively shielding itself from the actual ongoing turmoil (and, although less explicitly stated, by engaging in large-scale regime-sponsored patronage that relegates most Libyans to the political and economic sidelines). Although a short introductory chapter summarizes the basic argument, the book unfortunately contains no abstract framework that clearly sets forth what the author hopes to investigate or achieve beyond chronicling the turbulence of Libyan politics, or one that would allow the reader to compare implicitly its alleged uniqueness against examples of political and economic development in other rentier states. For readers interested in such questions, Lisa Anderson's now decade-old account (*The State and Social Transformation in Tunisia and Libya 1830–1980*, 1986) remains the most insightful one available.

The strength of El-Kikhia's account is that it provides a thorough, albeit descriptive and at times even speculative, rendering of Libya's recent and current political and economic history. Such is the paucity of serious works on Libya that this achievement alone should not be underestimated. But for social scientists who have closely observed Libya, this book will raise a number of serious questions regarding its evidence and interpretation thereof. In light of the fact that research in Libya is virtually impossible, it is perhaps hard to fault the author for relying so extensively on second-hand sources, even though some of those have become quite suspect and outdated by now, and even though first-hand written documentation is more abundant and available than the author claims.

Evidence, however, informs interpretation, and in this particular case it leads to a number of assertions this reviewer would dispute. Perhaps one example suffices to make the

point. El-Kikhia argues that Qadhafi has constructed a powerful neopatrimonial society (my words) in Libya. In language that recalls a by now traditional interpretation in Middle East studies, he asserts that the Libyan leader has done so by increasingly gathering around himself tribal support in order to stay in power in a divide-and-rule fashion. A good part of the book, and its appendix entirely, is taken up therefore in examining and documenting the growing role of the Qadhadhfa tribe in Libyan politics as evidence of this neopatrimonial society. This, however, represents an incomplete explanation that obfuscates simultaneously the process, structure, and evolution of Libyan politics and society since 1969.

In reality, and although Qadhadhfa members have become more prominent, the country's informal power structure, which El-Kikhia correctly identifies as the locus of real power (pp. 5–6), is permeated by scores of non-Qadhadhfa citizens whom the Libyan leader has deliberately cultivated as a means of offsetting the potential power of any institutionalized group, including his own tribe. In addition, El-Kikhia's analysis ignores a crucial development that has been heightened since 1969: the way in which Libyan society, due in part to policies fostered by Qadhafi but also because of the intense individual rent-seeking that has taken place, has become much more differentiated than a purely tribal scenario accounts or allows for. The notion that Libyan society is increasingly reverting back to tribal politics (p. 103), and the apocalyptic vision that pits tribes against one another in a struggle for survival in a post-Qadhafi situation, is therefore highly problematic. It ignores the profound reality that tribes in what eventually became Libya have never, not even during the disastrous colonial encounter, served as a sustained and coherent focus for opposition, and they show no real signs of doing so now.

Undoubtedly, this book will appeal to many readers who, for a number of reasons, share the author's interpretations and his conviction that Libya resembles nothing less than a predatory state that is unfortunately (mis)guided by a ruler whose actions often have been, both nationally and internationally, “beyond the realm of the rational” (p. xiv). While *Libya's Qaddafi* is a welcome addition to the literature, primarily for some of the insights it contains regarding the minutiae of politics in the country under Qadhafi, it should be read with a good deal of caution. It is a courageous work by an individual whose family has suffered considerably at the hands of the Qadhafi regime, but it is not the “completely evenhanded” account its dustcover touts. It also does not, despite the valuable information it contains, in the end provide the kind of comprehensive and more structural analysis that would allow an academic audience to better understand the author's central theses about the continuity in Libyan politics, or how Qadhafi's “politics of contradiction” flow logically from and reinforce that continuity.

The Rise of Christian Democracy in Europe. By Stathis N. Kalyvas. Ithaca and London: Cornell University Press, 1996. 300p. \$45.00 cloth, \$19.95 paper.

Kees van Kersbergen, *University of Nijmegen*

Christian democracy has been one of Western Europe's most successful political movements, yet it has long been neglected in comparative politics. This book is a welcome and innovative contribution to the field. It analyzes the origins of confessional parties in Belgium, the Netherlands, Austria, Germany, and Italy and explains why such a party was not successful in France. It not only provides a genuinely com-

parative account of the conditions under which these parties arose but also offers a theory of party formation that is potentially valuable in other contexts. A major strength of the book is its rare combination of an analytical framework rooted in rational choice theory and a detailed historical and comparative account of critical cases.

The study starts with an explanation of a peculiar fact that has puzzled the (scarce) literature, namely, that both the church and conservatives opposed the political mobilization of lay Catholics, but confessional parties nevertheless emerged. Kalyvas solves this puzzle in an elegant manner. He identifies the crucial actors, maps out their preferences, and develops a strategic model of party formation that explains the puzzling result. His thesis is that confessional party formation was the contingent and unintended outcome of the strategic moves made by the Catholic Church and conservative politicians in response to the liberal anticlericalism of the late nineteenth century. The author convincingly shows that the rational calculus of costs and benefits by the church and the conservatives in this "game" led them both to oppose the formation of confessional parties.

In the light of the liberal assault, the church preferred to follow a strategy of compromise because the creation of mass organizations of lay Catholics would produce prohibitively large negative externalities. The church traditionally controlled its members through hierarchy and centralization. But mass mobilization would break this unity and subvert hierarchy by allowing the lower clergy and lay Catholics to become independent of the episcopate. The problem, of course, was that the liberals were unwilling to compromise and instead intensified their attack on the church's power in society. Given the ineffectiveness of the numerous attempts at a compromise, the church was eventually forced to choose the organizational strategy for its defense and to participate in the political process. But even political participation of lay Catholics involved substantial costs, such as a further weakening of the bond between the church and its members, a loss of control, and a possible backlash against Catholicism as an effect of politicizing religion.

The conservatives' preference was to continue their participation in the political game and to find a way to call a halt to the liberal advance. The conservatives, however, lacked the resources and the salient issues necessary for mass mobilization. Moreover, mobilization also appeared too costly for them. The liberal attack against the church itself created the opportunity for avoiding these costs, however. Religion potentially was an electoral asset, and the organizational powers of the church could be used as a political resource. Neither the church nor the conservatives, however, favored the formation of Catholic parties. The conservatives feared that the permanent politicization of religion and the association with the church would restrict their autonomy. The church feared the confessional party because it shifted the source of power of activists from the church to the voters. Moreover, it diluted the hierarchical relation between church and activists and therefore threatened to reduce the influence of the church in society.

The author shows how the interacting strategies of the two main actors opposed to the formation of confessional parties paradoxically produced the unwanted outcome. First, the church took centralized control over the existing yet loosely organized associations of lay Catholics and thus created the Catholic social movement. Next, provoked by increasing anticlericalism, the movement rapidly politicized, especially when the church decided to use its organizational capacity in support of those conservative politicians who agreed to defend the church's interests. This participation strategy

unintendedly produced two new actors (lay Catholic activists and politically active priests) as well as a new identity (political Catholicism). Finally, the prochurch coalitions unexpectedly turned out to be electorally successful. As a result, political Catholicism gained a momentum that went beyond the control of the church. Electoral success provided the mechanism of transition to the formation of confessional parties. The author shows that these sequences constituted the general pattern in five nations but not in France. Contrary to conventional explanations that stress the decline of religiosity, Kalyvas argues that it was a series of electoral defeats of the prochurch coalitions that prevented the formation of a confessional party in this country.

A second major argument of this study is that the formation of confessional parties reinforced a distinctive Catholic political identity which not only reinterpreted Catholicism in much less doctrinal terms but also started to challenge the religious primacy of the church in political matters. As a result, political Catholicism became separated from the church and religion. "Thus, in a paradoxical way, the politicization of religion contributed to the secularization of politics" (p. 245).

The analyses are generally convincing, and there is only one major quibble. The author does not explain why only the church and the conservatives are included in the model as actors with preferences and strategies and why the lower clergy and the lay Catholic activists are treated as merely by-products of the strategic actions of the main actors. One reason the church was and remained so vehemently opposed to the formation of confessional parties is, in my view, that lay Catholics and priests were already mobilizing politically long before the church decided to follow the participation strategy. The conservatives and the church reacted not only to the liberals but also to the grassroots activism of Catholics themselves. This activism not only was prompted by anticlericalism but also was a response to the effects of industrialization, a topic largely neglected in this study. Social Catholicism now wrongly appears to have been created by the church, while in reality the presence of social Catholics changed the very calculus of the church and the conservatives. This otherwise fascinating study tends to shed insufficient light on the crucial effect of a third actor. The model seems therefore incomplete because it ironically excludes the only actor in favor of the formation of a confessional party.

The Radical Right in Western Europe: A Comparative Analysis. By Herbert Kitschelt. Ann Arbor: University of Michigan Press, 1995. 332p. \$49.50.

Ekkart Zimmermann, *Dresden University of Technology*

Kitschelt deals with three variants of the radical right in seven countries: France with the National Front as the "prototype of the New Radical Right"; Austria and Italy ("blending new right appeals into a broad populist antiestablishment strategy"); Germany, Norway, and Denmark, with a "milder version of the new radical right"; and Britain, with the National Front as a failing case. The theoretical framework is contained in two theoretical chapters dealing with alternative explanations as well, and it is taken up again in two final chapters, with the country studies in between. Dealing with so few cases in so many variations and (almost by necessity) following a sampling procedure on the dependent variable may easily create problems of design, theoretical explanation, and empirical inference. These do not fade away when taking Kitschelt's earlier book (*The Transformation of European Social Democracy*, 1994) as a companion volume that uses the

same theoretical framework with a different dependent variable. If Kitschelt were to succeed, then the case could be made for powerful and parsimonious theorizing. Does he?

Kitschelt argues that the rise and the success of new radical right parties mostly after 1965 cannot be understood by a demand perspective alone (a shift in voter preferences) but must be complemented by the more important supply aspect (logic of party competition, internal organization patterns, and ideological traditions). Kitschelt senses a shift of voter preferences from the traditional Left-Right axis to an ideological cleavage dividing left-libertarians from right-authoritarians. How do the established parties react to this?

This shift in political issue preferences has occurred only in advanced postindustrial capitalist societies, the first condition for a new radical right party to emerge. The gate-keeping function is provided by the second condition, a convergence of the moderate leftist and rightist parties in political issues and more so in a government coalition. Just as on the left, new oppositional space will then be opened at the right end of the political continuum. Whether a new radical right party will form and have electoral success *further* depends on organizational skills, leadership resources, media attention, and successful competition in "secondary elections." The third major condition in the political opportunity structure emerges in the presence of a patronage-based party system and political economy. Here the populist antistatist radical right scores its biggest successes with a broad coalition of protest voters (Northern League in Italy and the Austrian Freedom Party). Yet, if the third and second mobilizing condition break down, then these rightist protest parties are doomed. This is not so, Kitschelt argues, when a *rightist authoritarian* party (the master case of the new radical right) "combines economic pro-market and political authoritarian and xenophobic messages" (p. 42), a mixture that may be less contested by the major parties. Those parties have an ideological niche but also fewer adherents than populist-antistatist parties.

In the third case, that of welfare chauvinist parties, emphasizing the issue of ethnic homogeneity in the defense of the welfare state, a similar logic applies. Furthermore, there are contradictory effects of widespread higher education in advanced European welfare states, making voters more resistant to simple formulas of both, cutting massively into the welfare state, or putting the blame on foreigners as to undermining the welfare state (p. 23). The negative effect on support for welfare chauvinist parties is to predominate among the public at large.

There is a fourth variant of the radical right, the neofascist type, with which Kitschelt deals in passing. Due to historical burdens and changed politicoeconomic circumstances, parties like the NPD in Germany and the MSI in Italy end up in failure. He adds a brief assessment of the conditions of fascism and national socialism in the interwar period (pp. 28–42), which oversimplifies a more complicated set of conditions and focuses on structural conditions only.

Kitschelt largely relies on survey data (mostly the *World Values Survey*, 1990) that sometimes are a bit dated. The number of respondents with sympathies for radical parties often is limited in those data. Even more problematic is the extensive reliance on factor analytic methods (including confirmatory factor analysis). The amount of data trimming (in the hands of the collaborator Anthony J. McGann) meets with reservation when, for example, reading that the varimax rotation "does *not* allow for a simple two-dimensional representation of the results" (p. 88, emphasis added). Yet, the trimming goes on to meet the theoretically outlined dimensions in the data structure. Also, in many instances (p. 65 on

the economic growth ranking for the French National Front or p. 74 with respect to populist antistatism) the distinctions between the variants of the new radical right do not show up as precisely and consistently as one would wish.

Chapter 8 links the comprehensiveness of the welfare state with left-libertarian versus right-authoritarian opinion cleavages in the electorate and the convergence of the established moderate Left and Right parties, as well as the political salience of race and immigration, to predict either stability of the party system or change toward left-libertarian or right-authoritarian parties. Noteworthy is the discussion of under which conditions the welfare state was founded and extended and how this may change through ethnic pluralization. Arguing against public bads, namely, having more crime and xenophobia, Kitschelt defends the welfare state and ethnic pluralization against the new right. Some arguments (referred to) here are naive, for example, concerning the relationships between highly developed and less-developed states under global economic conditions (e.g., as to limiting the mobility of people between highly developed states, p. 273).

The latter point brings up the issue of a classical misnomer, that of "left-libertarianism." People subsumed under this syndrome share beliefs in participatory and individualist cultural values and a privileged existence in the welfare state. Yet, how about a liberal economy? Without becoming polemical here, you may call them left-libertarians if you want, but it should be added for clarity that these so-called left-libertarians may be antilibertarians when it comes to the *economy*.

This leads back to the (assumed or proven?) rectangularity between the two basic dimensions of socialist versus capitalist economics and libertarian versus authoritarian politics. Kitschelt would have little trouble in comparing East Asian states with Western Europe along those dimensions. Within Western Europe, however, such a fundamental two-dimensional space and the shifts therein need much further corroboration.

Furthermore, Kitschelt argues that the winning formula of the new radical right consists in the mixture of "economic free market appeals that are combined with authoritarian and ethnocentric and even racist messages" (p. viii), and he lists among the groups *overrepresented* here blue-collar workers and small business, such as craftspeople, shopkeepers, and farmers. Otherwise, social background is said to have little effect on voting for new radical right parties, after controlling for political attitudes. A brief look at earlier waves of the radical right in the 1960s, 1950s, and the interwar period would have revealed that the antistatist ideology may only be a first step, followed by protection for one's own turf, in particular under the conditions of increased (global) competition (on p. 19 this argument seems to be shared). Whatever party platforms may say, the relevancy of such arguments cannot be totally denied. Moreover, theoretical explanations such as status politics, status frustrations, and status inconsistency, to name only a few in a series of previous efforts (by, e.g., Lipset, Hofstadter, Bell, Parsons, Geiger, Ranulf) to come to terms with the radical right, are missing in the perspective of Kitschelt, which is dominated by the supply-side logic.

In terms of design, Kitschelt's approach calls for a full party-to-party comparison *everywhere* along the political spectrum to get at the dynamics of changes in issue preferences and protest voting as well as to avoid the sampling on the dependent variable. The quality of data needed for a truly causal comparative assessment must go much beyond that presently available.

The electoral landslide of Blair in Britain may again be a deviating (British) case. Yet, to the Continent it may signify a different future evolution of the party system than envisioned by Kitschelt. The competition of major parties for the center continues, perhaps with less entrenching in old ideological patterns, but in successfully copying elements from other parties that work well while simultaneously avoiding their and one's own (past) mistakes in electoral strategy. Such a strategy may leave the end positions of the Right (and Left) open or may drive it into marginality with an increasing overrepresentation of unskilled workers.

Currently we lack an independent test case of the theory presented. It remains to be seen whether Kitschelt's theory is more than a momentary depiction. One also would like to know to what degree interactive, additive, or substitutive relationships prevail among the essentially three critical variables—convergence of the dominant parties, political patronage, and economic crisis. Either in perception or in reality, the latter variable underlies any of the demand shifts to the radical right. The basic theoretical elements Kitschelt uses may be convincing, less so the labeling of the political space and other issues of methodology.

This study is a milestone. It is guided by theory, with an emphasis on macro phenomena, and has potential applicability to a broad range of phenomena. With repeated evidence, Kitschelt dismisses other more simple rival hypotheses, making claims for, for example, single-issue protests (taxes and immigration), disaffection with elite democracy, right-libertarianism and neofascist countermobilization, as well as for a counterreaction against left-libertarianism and effects of electoral laws. The *Radical Right in Western Europe* is not the definite word on either the new radical right or the emergence of party systems. Combining knowledge about the various countries with broad analytical goals, it remains an intellectual achievement. Even where wrong (or possibly wrong in the future), it is a source of learning for all—scholars, interested general readers, and politicians alike.

Japan's Postwar Party Politics. By Masaru Kohno. Princeton, NJ: Princeton University Press, 1997. 172p. \$55.00 cloth, \$17.95 paper.

The Japanese Election System: Three Analytical Perspectives. By Junichiro Wada. New York: Routledge, 1996. 112p. \$60.00.

William W. Grimes, *Boston University*

In 1993, the Liberal Democratic Party (LDP) lost its parliamentary majority in Japan and entered the opposition for the first time since its formation in 1955; the following year, a non-LDP coalition government passed a major reform of the Lower House election system. At the core of these momentous events was a belief that the existing electoral system had led to a variety of unfortunate effects in Japanese politics, which a new system might reduce or eliminate. The present review considers two new books that seek to advance understanding of just what those effects were and why they appeared.

The Japanese Election System addresses the 1994 electoral reform from a rational choice perspective. This focused, extremely short book (only 54 pages of text) began its life as the author's economics Ph.D. dissertation, and it appears not to have undergone serious revision in its journey into print. The "three analytical perspectives" of the title are a game-theoretic analysis and application of Duverger's Law, a rational coalition analysis of the internal politics of the LDP, and a model of the economic effects of pork-barrel politics.

These three substantive chapters are introduced by a concise history of the Japanese electoral system from the Meiji period (1868–1911) until 1994.

Wada seeks to demonstrate that (1) the old system of multimember electoral districts with a single, nontransferable vote was superior to the new system (a 3:2 mixture of single-member districts and regional proportional representation) and (2) the consistently unbalanced apportionment of Lower House seats in favor of rural districts since the 1950s has been a major drawback economically as well as politically. (Some Japanese writers see unequal apportionment as offering the benefit of automatic redistribution to the economically declining rural areas.)

The book offers some interesting insights. The analysis of Duverger's Law focuses on candidates' choices of whether to run or to exit rather than on citizens' decisions on how to vote. Based on a three-party model with varying voter preferences in a single-member district, Wada demonstrates that a game of Chicken is likely to develop between opposition parties, and thus their candidates will run even when it would be rational for one to drop out in favor of an ideologically similar opponent. Unfortunately, while the analysis does have some explanatory power in a static situation, it ignores some relevant longer term considerations, such as the desire to position oneself as the main challenger in the next election.

The strongest analysis is that of the LDP as a coalition government. Wada addresses an interesting puzzle in Japanese politics—why factional representation in LDP cabinets went from a "mainstream" versus "anti-mainstream" spoils system to one of proportionality to Lower House strength. His model shows that, as opposition parties moved ideologically closer to the LDP, antimainstream LDP factions had a more credible threat of breaking away from the party to form a government with them. In order to maintain the loyalty of factions that lost out in the contest for leadership, proportional representation in cabinets came to be a recognized norm within the LDP. Wada's analysis includes simulations of bargaining sets and cabinet representation that match well with actual post-1983 LDP cabinets.

While it brings mainstream American public choice theory to the study of Japanese electoral politics, *The Japanese Election System* is unlikely to have a strong influence on either field. From the standpoint of the study of Japanese politics, none of Wada's results appear very exceptional. In terms of theory, his models may be of some interest but appear to offer more in the way of modification than innovation.

Japan's Postwar Party Politics, in contrast, is likely to become required reading in the field of Japanese politics. I suspect that it will also earn a respected place in comparative politics and comparative electoral studies. The book is a concise and well-written rational-choice analysis of several key events and evolutions in Japan's electoral and party systems. These include early postwar electoral reforms, pre-1955 coalition building, the creation of the LDP in 1955, the evolution of LDP factions and party norms from 1955 to the 1980s, the evolution of the overall party system in the same period, and the political upheaval of 1993. What is most notable is the way in which Kohno applies theory to detailed historical accounts; unlike many game-theoretic treatments, this book cannot be accused of being "ahistorical."

Kohno criticizes traditional explanations (which he categorizes as "political-cultural," "historical," and "socio-ideological") on both logical and empirical grounds, making a strong case in each of his chapters that they have been overextended in both directions. In particular, he is bothered by their lack

of attention to independent political actors: "These approaches all entail overly deterministic explanations for political outcomes: to the extent that Japanese political actors are the 'prisoners of the underlying structure,' no matter what power, incentives, and strategies each relevant political actor has, the Japanese political systems and processes would have evolved the way they actually did" (p. 29).

The book is at its best in analyzing coalition building in the early postwar years, including electoral reforms in 1945 and 1947, the series of coalition governments before 1955, and the LDP merger itself. In each case, a methodical application of bargaining theory (with an assumption of a unidimensional policy space) gives order to tangled historical processes and provides answers to niggling questions and contradictions that have long been ignored.

To be more concrete, let us consider Kohno's analysis of the 1947 formation of the Katayama cabinet (a Socialist-led coalition of Socialists, Democrats, and several smaller parties). Most studies point either to the existence of a "New Deal consensus" or to the Socialists' plurality in the Lower House as central factors. Kohno refutes the former notion by pointing out that in early negotiations for a grand coalition the Socialists acquiesced to many key demands of the conservative Liberal Party. As for the latter, he points out that no established norm gave the largest party automatic leadership of the government; moreover, the Socialists' plurality over both the Liberals and Democrats was quite small. Also, neither explanation accounts for such apparent anomalies as the length of negotiations, the Socialists' persistent courting of the Liberals, or the Liberals' willingness to support the election of Katayama for prime minister before a cabinet was formed but only two days after having opposed the Socialists' and Democrats' joint candidates for speaker and vice-speaker of the Lower House. In Kohno's interpretation, the Socialists courted the right-wing Liberals because they rightly feared a Liberal-Democratic coalition and thus preferred a grand coalition to the possibility of being left out of government. That fear also led them to propose voting for the prime minister before bargaining was completed, in order to ensure that they would remain in the game. The Democrats and the Liberals accepted that proposal because the former were unable to come up with an alternative candidate, while the latter could only retain the hope of breaking apart the Socialists and Democrats if they remained in the bargaining process. The resulting game might well have been indeterminate but for the *deus ex machina* of General MacArthur's public endorsement of Katayama's selection. That made Katayama the focal point for subsequent coalition bargaining, at which point the principle of maximizing power by minimizing surplus majority took over, and the Liberals were dropped from contention.

The chapters on the evolution of intra-LDP politics (originally published as "Rational Foundations for the Organization of the Liberal Democratic Party in Japan," *World Politics*, 44[1992]:369-97) and of the multiparty system are also solid, but they provide fewer counterintuitive insights. Both use Duverger's Law and the concept of "expected party [or faction] differential" to explain the numbers of actors (parties or factions) and the style of their interactions.

The final substantive chapter, on the realignment of 1993, is less authoritative (ironically, since it is presumably easier to determine the actual incentives and preferences of actors in recent rather than less recent cases). Kohno focuses on the breakup of the LDP and the formation of the non-LDP coalition. The microanalytical approach is consonant with the fact that most of the Diet members who left the LDP to form the Shinseitō and Sakigake parties were relatively junior

members of the Lower House, and thus they were the most politically vulnerable if accused of trying to block reform. Kohno also provides a credible explanation for the coalition negotiations. It would be interesting, however, to see what he would make of the LDP-Socialist-Sakigake coalition formed in the summer of 1994 (one doubts that Kohno predicted this strange union any better than any other observer), the results of the October 1996 elections under the new system, or the present tug-of-war within the LDP over whether to continue the existing quasi-coalition or to try to form a more formal conservative coalition.

Readers will find two main weaknesses in Kohno's work. The first is a tendency to be dismissive of more macroscopic approaches. In some cases that attitude is warranted, but often such approaches simply address different questions than Kohno's. The second is that much of his analysis remains speculative. In order to avoid the pitfalls of hindsight, Kohno's approach requires him to construct hypotheses about actors' contemporaneous perceptions and preferences that may or may not be accurate. Also, given the one-shot nature of the events analyzed, it is often difficult to distinguish those elements which are systematic from those which are merely coincidental. To me, his judgments generally appear sound, but there is surely room for other scholars to dispute them. One hopes that this book will become a focal point for a debate that matches clear questions with logical, historically supported answers as well as Kohno has.

The End of the Peasantry: The Rural Labor Movement in Northeast Brazil, 1961-1988. By Anthony W. Pereira. Pittsburgh, PA: University of Pittsburgh Press, 1997. 280p. \$45.00 cloth, \$19.95 paper.

Kurt Weyland, *Vanderbilt University*

Recent analyses of Latin American politics—even studies of popular sectors—have focused almost exclusively on urban areas. Anthony Pereira's fine book helps fill this gap through an in-depth case study of the workers' movement in the sugar zone of Pernambuco. This section of Brazil's poor Northeast is of particular interest because it has been the site of one of the most active labor movements in the country.

Pereira sketches the book's theoretical themes in the introduction and first chapter. Like many others, he criticizes the literature on democratic transitions for its "elitism and lack of historical perspective" (p. 8). The author combines state- and society-centered approaches (pp. xviii-xix) to explain the striking transformation of rural mobilization in Pernambuco: Whereas peasant leagues pressing for land redistribution predominated in the early 1960s, rural labor unions demanding wage raises—a much less controversial demand—became ever more active during Brazil's democratic transition. This change stemmed in part from agricultural modernization, which shrank the peasantry and gave rise to rural wage labor. Furthermore, the Brazilian state promoted rural labor unions, which were less radical than the earlier peasant leagues. These unions gained increasing independence from state control and turned more "militant" (p. 4) after 1979.

Chapter 2 reviews the emergence of militant peasant leagues and more moderate rural labor unions during the government of João Goulart (1961-64). Chapter 3 analyzes the agricultural modernization stimulated by the development policies of Brazil's military regime (1964-85). It documents the displacement of many peasants and the growing social differentiation in the countryside, especially the rise of wage workers and small farmers. Chapter 4 shows how the

corporatist strategies of the authoritarian regime provided significant resources to rural labor unions, which came to distribute welfare services and in this way attracted numerous members. The unions shook off state control during democratization, mobilizing growing support among rural workers and attaining considerable gains through strikes and bargaining with plantation and mill owners.

Complementing this analysis of macrostructural developments, the following chapters, which are based on intensive field research in the sugar zone during the late 1980s, investigate the activities of rural labor unions at the local and regional level. After examining unions' limited capacity for collective action, chapter 5 stresses the disproportionate attention that their leaders devote to the provision of welfare services and to wage issues. By contrast, leaders deemphasize land redistribution, which is difficult to achieve and benefits few constituents. Chapter 6 examines landlord violence and the state's failure to protect union leaders and rural workers. The resulting climate of fear constrains union activities. Chapter 7 documents rural unions' disappointment with Brazil's political parties, most of which rely on clientelism and lack a programmatic orientation. As a result, unions are unable to use the large number of their constituents for effectively advancing their interests in the electoral arena. Due to unions' other priorities and the multiple constraints they face, plans for land redistribution made little headway under the new democracy, as chapter 8 shows. After summarizing the book's main findings, chapter 9 stresses the challenges confronting rural unions in recent years, when their moderate attitude and the failure of land reform triggered the emergence of more militant competitors, such as the landless workers' movement.

Contrary to the heroic image painted in many analyses of trade unions and social movements, Pereira draws a refreshingly realistic picture of the opportunities and numerous constraints faced by Pernambuco's rural unions. Given that he studied a "best case," that is, one of the relatively successful instances of lower-class mobilization in Brazil, this general finding is especially noteworthy. Displaying a fine sensitivity to the multiple dilemmas confronting union leaders and members, chapters 4–8 are the strongest sections of the book. The author's insights on union culture, which are based on intensive participant observation and a survey of 50 union leaders, are particularly interesting.

Pereira also does an excellent job of analyzing the interface of local- and national-level structures and processes. In this way, he thoughtfully explores the effect of "big processes," such as democratization, on the lives of common people. Chapter 7, for instance, provides a new perspective on the much-discussed weaknesses of most Brazilian parties by thoroughly examining the difficulties that union leaders and members face in using elections for making successful demands.

Another important contribution of the book is the emphasis on increasing social differentiation in the countryside. Peasants turned into wage workers, impoverished field hands, better-paid technicians, or small farmers, or they migrated to the cities. Pereira therefore correctly eschews dichotomous class categories (pp. 13–5, 44–8, 152, 167).

While the book's greatest strength lies in the author's rich observations, its contribution to political science theory is somewhat more limited. Pereira's criticism of the democratization literature (pp. 6–10, 154–5) echoes earlier arguments. Combining state- and society-centered theories (pp. xviii–xix, 154) as well as macrostructural and microanalytical perspectives (p. 80), the author does not frontally address important "paradigmatic" debates. He also could have dis-

cussed alternative arguments on his topic, for instance, by criticizing the more optimistic image painted in much of the social movements and labor literature.

Furthermore, the integration of different approaches leaves some questions unresolved. For instance, if the rise of rural labor unions stemmed from "the end of the peasantry," then these unions appear as faithfully representing their constituents. But if this change was due to the inclusionary corporatism of the military regime, then unions appear more as "filters" that pursue the interests of some constituents while neglecting others. Other arguments also are slightly ambiguous. For instance, after boldly proclaiming "the end of the peasantry," Pereira stresses the survival of a "peasantariat"—a combination of peasants and workers (pp. 60–1)—and the "durability of a peasant identity" (p. 65). Similar ambiguities appear in his characterization of unions' stance ("militant" on pp. 4, 75, 156 versus "pragmatic" or "incremental" on pp. 136, 161) as well as in his assessments of unions' degree of success (e.g., p. 156 versus p. 160) and of the effectiveness of state efforts to tame and coopt them (pp. 58–9, 75 versus pp. 80, 92–4, 100–101, 136, 162).

Despite these quibbles, Pereira's rich and sensitive analysis of union activities and the dilemmas their leaders and members face makes a fine contribution to the literature. The book is recommended to scholars interested in contemporary Brazilian politics and to specialists on labor unions and social movements in Latin America.

The Counter-Insurgent State: Guerrilla Warfare and State Building in the Twentieth Century. Edited by Paul B. Rich and Richard Stubbs. New York: St. Martin's Press, 1997. 235p. \$59.95.

Marc V. Simon, *Bowling Green State University*

The central issue explored in this edited volume is the relationship between counterinsurgency wars and the evolution of the institutional state in developing countries during the latter half of the twentieth century. The editors understand that this relationship is only one of many factors important for explaining state development; it is not the sole determinant. The theoretical foundation for this volume comes from the structuralist literature, beginning with works like *Bringing the State Back In* (Peter Evans, Dietrich Rueschmeyer, and Theda Skocpol eds., 1985), but the insights which emerge are applicable to a wide range of theoretical work and models of revolution and government versus opposition conflicts. By omitting a concluding chapter, the editors missed a chance to expand on these linkages and clarify an appropriate agenda for future research. The cases selected show a variety of effects of internal wars on the state. Though the authors make few references to discussions in other chapters, most of the contributors focus on the central issues and propositions raised in the Introduction. Overall, as edited volumes go, this one is quite coherent and thought provoking.

Within the nexus of state evolution and insurgency, some of the relationships investigated are of particular interest to formal modelers and other theorists of revolution. Two examples are the effects of the type of counterinsurgency strategy pursued by the state and the effect of internal war on the relative power of the military within the state. The chapters on the Philippines (by Patricio Abinales), the Malayan Emergency (by Richard Stubbs), and Peru (by Philip Mauceri) do the best job of investigating these issues.

The Malayan case provides an excellent illustration of the effectiveness of changing from a coercive, hawkish strategy of

counterinsurgency to a more dovish, "political" strategy aimed at addressing rebel grievances and building legitimacy. The hawkish strategy appeared to weaken an already weak state by putting a strain on resources and stimulating rather than repressing the growth of the insurgency. Changing to the political strategy, combined with a windfall of revenues from the Korean War, reversed this cycle. The state began to centralize and strengthen itself, increasing its extractive capability; addressing rebel grievances built legitimacy and diminished rebel strength. This not only defeated the insurgency but also provided the state with capacities that led to more successful economic development. In contrast, the Marcos regime in the Philippines pursued a more "predatory" mix of strategies against the NPA insurgency (the Moro rebellion is omitted). This allowed Marcos to centralize the Philippine state and freed him from the power of the *caciques* (the landed elite), but it failed to defeat the insurgency, as much because of the rebels' own self-reliant and decentralized strategy as because of the state's hawkish strategy. In the end, Marcos's failure as well as the NPA seem to be determined by poor strategic choices, which, with some U.S. influence, brought the *caciques* back to power.

In Peru, we see further evidence that the more hawkish strategy may tend to be less successful in the context of a weak state. In the fight against Sendero Luminoso, the poor administrative capacity and resource base of the state prevented the efficient implementation of a hawkish strategy. Furthermore, by giving the military more power in the state, the hawkish strategy reduced state legitimacy. Peru was unsuccessful against the guerrillas until the Fujimori regime first developed more efficient state administration and a stronger economy, which then were used to carry out an effective counterinsurgency strategy.

A more dovish, "political" mix of tactics does not always fare well either. The Algerian case (by Paul Rich) shows the FLN trying to coopt the Islamic FIS opposition by campaigns of Arabization and mosque building, but these fed the growth of the FIS and revealed the degree to which the government is cut off from the values of the opposition and much of society. Other weak state cases are important as examples of how insurgency can lead to state breakdown. In Mozambique (by Tom Young), Afghanistan (by Stephen Chan and Dominic Powell), and Sri Lanka (by Bruce Matthews), counterinsurgency has failed or nearly failed. Again, a concluding chapter might have yielded better generalizations about the reasons for these failures. Weak states do not have the capacity to pursue vigorous military strategies in the absence of intervention, and they are often ineffective in administering political strategies as well. In these cases the militarization of the conflict did strengthen the role of the military in government but did not result in the type of centralization, efficiency gains, and increased extractive capability that strengthened the Philippine state in the Marcos years.

Other issues which might have been considered in this volume include the role of interveners as well as the role of ideas and learning in each of these conflicts. Intervention was an important factor in the Afghanistan, Mozambique, and Northern Ireland cases, and the lack of intervention on one side or the other was important in Peru and the Philippines. Another theme which emerged from reading these chapters was that the success of counterinsurgency often depended on the application of lessons learned in other cases. This is true of the Northern Ireland chapter (by Paul Dixon), in which we see Britain applying several "lessons of Vietnam." In many of the failure cases, lessons from other insurgencies were not known or applied, though they obviously could have helped (for example, in Mozambique or Peru). The capacity to learn

is an important element of the strength of the institutional state; reasons for the success or failure to learn should be more developed. Also, the effects of ideas, culture, and political identity issues (emphasized in the "fourth generation" of revolution theories, following the structuralist, "third generation" represented by Skocpol and others) appear important in some of the cases, particularly Algeria and Mozambique. These insights, however, are left undeveloped.

This book provides readers familiar with theories of revolution, social movements, and conflict processes ample evidence to provoke new insights. It will benefit readers who know much of the historical background of these cases and can thus understand the subtleties and uniqueness of some of the arguments made. Formal modelers will benefit from this collection as well; it provides a beginning empirical evaluation of some important assumptions and processes used in many models, including my own. In particular, the relationship among state and rebel strategies, state building, and the outcome of counterinsurgency and insurgency is shown to be complex but amenable to theory building.

Restrained Trade: Cartels in Japan's Basic Materials Industries. By Mark Tilton. Ithaca, NY: Cornell University Press, 1996. 225p. \$29.95.

Troubled Industries: Confronting Economic Change in Japan. By Robert M. Uriu. Ithaca, NY: Cornell University Press, 1996. 290p. \$45.00 cloth, \$17.95 paper.

Japan under Construction: Corruption, Politics, and Public Works. By Brian Woodall. Berkeley: University of California Press, 1996. 227p. \$28.00.

H. Richard Friman, *Marquette University*

These three books challenge the increasing polarization of the literature on Japanese politics between developmental state and rational choice approaches. The authors do so through seeking a more nuanced integration of bureaucratic autonomy and political pressure explanations of Japanese industrial policy. To explore this middle ground, the authors turn to substantive work on two underexplored areas of industrial policy: the domestic construction market and adjustment policies for Japan's declining industries.

Brian Woodall argues that Japan is best understood as a dual political economy in which high-growth sectors and a developmental state lie in a "symbiotic balance" with, but are "largely insulated" from, extensive clientelist networks (p. 135). He contends that Japan's dual political economy helps explain governmental resistance to U.S. efforts at market access, continued economic growth despite clientelism, and patterns of collusion between state and societal actors more extensive than those found in other advanced industrial democracies. In exploring these issues, Woodall concentrates on Japan's domestic construction industry as a "case study of a crucial policy domain within Japan's clientelist state" (p. 22).

Beginning in the mid-1980s, U.S. efforts to gain access to Japan's domestic construction market publicized the broader patterns of price fixing and bid rigging in Japanese public works projects. Why did the Japanese government resist pressures for increased market access? Woodall argues that resistance reflected the threat that liberalization posed to the extensive network of clientelism in public works, a network linking the interests of elite public works bureaucrats, career politicians, and construction contractors. Woodall's detailed work on the players and politics of collusion in Japan's domestic construction market, especially the sections on the

construction industry and Ministry of Construction, is a strong addition to the literature.

Nevertheless, Woodall's linkage between clientelist networks and Japanese resistance to U.S. pressure on public works risks overstating the former's effect. He ignores, for example, the broader context of bilateral trade disputes over market access distinguished by U.S. threats of retaliation under Section 301. This context suggests a wider array of bureaucratic players and the potential for interministerial pressures to disrupt the influence of clientelist networks. More important, Woodall overstates the relationship among the construction industry, the Liberal Democratic Party (LDP), and its policy tribes. Support for the finding that the construction industry is a primary financial source for LDP candidates, for example, is anecdotal and lacks comparative data on other industry and agricultural contributions. Faced with an inconclusive multivariate regression analysis on the determinants on public works spending, Woodall also overstates the importance of campaign contributions by firms as a possible explanation of tribal funding choices (compare pp. 118, 123, 161).

Woodall is less convincing in his secondary discussions of the relationship between clientelism and economic growth and the cross-national variation in the persistence of collusive practices. He notes the "much honored" and "supposedly iron-clad" hypothesis that clientelism inhibits economic growth in developing countries and underdeveloped regions, and he then cites Japan's experience over the past forty years as challenging this hypothesis (pp. 16, 134–7). Since Japan is not easily classified as a developing country during this period, the extent of the Japanese anomaly is unclear. Similarly, the question of cross-national variation in public works collusion requires additional work. Woodall offers only brief comparisons with Italy and passing references to the United States and France, which lend limited support to the conclusion that differences in institutions matter.

Robert Uriu turns to a broader focus on Japan's declining industries. He argues that they challenge the traditional views of Japan's success in structural adjustment and bureaucratic autonomy in industrial policymaking. Rather than rely on market forces to direct adjustment, bureaucrats have shielded declining industries, especially through the use of cartels. Similar to Woodall, Uriu takes issue with bureaucratic autonomy arguments. He hypothesizes that policy choices reflect the preferences and influence of industry actors as well as pressure from the industry's political supporters and an industrial policy environment of domestic (primarily intrastate) and international constraints.

Uriu accurately notes the potential for a stronger test of bureaucratic autonomy arguments in cases of declining industries in which public and private interests are more likely to diverge. Rather than assuming industry interests, Uriu also explores their sources. He hypothesizes that industry structure shapes the preferences of industry actors for political and/or economic adjustment strategies. Uriu tests his arguments on industry preferences and influence against eight detailed case studies of troubled industries in Japan, with a primary focus on cotton spinning, steel mini-mills, synthetic fibers, and shipbuilding.

Uriu's conceptual framework and case studies, however, contain inconsistencies and omissions that overshadow the book's potential significance. In presenting the first portion of the framework, Uriu argues that "the main actors within an industry—individual firms and their labor forces—will be the ones most likely to influence policy outcomes" (p. 10). In contrast, Uriu's case studies reveal that industry associations often played a greater role than individual firms and labor,

especially in less concentrated industries, such as cotton spinning. The case studies also reveal organized labor as less consequential than either individual firms or the industry associations. Labor's relative influence is also difficult to isolate since the author offers few cases in which the demands of labor, individual firms, and industry associations diverge. Although Uriu later acknowledges the mitigating effect of Japan's enterprise unions on labor's influence, the conceptual framework is weakened by its initial omission.

Uriu makes a better case for linking the broad preferences of individual firms and labor for economic and political adjustment strategies to "the structure of the industry," specifically concentration and size of labor force (p. 10). The case studies, divided along the lines of this operationalization, largely support the argument. But what other indicators matter? The work of scholars such as Peter Gourevitch and Helen Milner on the effect of international factors on industry preferences is part of a broader literature that Uriu needs to address, if only to rule out alternative explanations. Similarly, to what extent does a demonstration effect take place, whereby firms and labor look to the earlier experiences of their counterparts in other industries in following economic and political adjustment strategies? Uriu all too briefly acknowledges the limitations of a two-variable explanation at the close of chapter 2, and then adds a nine-sentence footnote to explore industry homogeneity as an additional variable.

The second portion of the book's conceptual framework, as presented in chapter 3, explores the policymaking environment, which Uriu defines as "the political and bureaucratic actors and institutions, both domestic and international, that are involved in or influence the policy process" (p. 23). Uriu focuses on the Ministry of International Trade and Industry (MITI) as "the relevant ministry" in industrial policy (p. 23). Other Japanese ministries and the literature on them are not addressed in the conceptual framework. This creates an anomaly in Uriu's case study of the shipbuilding industry, since the Ministry of Transportation dominates the analysis, and in the book's conclusion the ministry is ignored.

Uriu argues that industries can influence bureaucrats directly and work indirectly to obtain influence through the support of politicians. Each of the case studies reveals industry influence over the bureaucracy's policy choices, suggesting a challenge to bureaucratic autonomy arguments. Yet, the more important questions are why such influence occurs and what explains the extent of interindustry variation. The book contains an array of possible causal factors but does not offer or test explicit hypotheses.

Uriu writes, for example, that an industry's direct influence is shaped by control over information, the ability to withhold cooperation, and MITI's desire to avoid open confrontation. Indirect influence is shaped by industry assets in dealing with politicians—financial contributions, voting strength, the presence of contending constituents, and regional concentration (a variable added in the case studies)—as well as the sensitivity of bureaucrats to politicians and contending pressures from other industries. When variables stemming from the legal trust and international environments are added into the framework, the reader faces a double-digit array of explanatory factors chasing four primary and four secondary cases. Uriu acknowledges that parsimony suffers when integrating levels of analysis. Such integration efforts are commendable, but the proliferation of variables noted above has more to do with an underspecified conceptual framework. Thus, while Uriu's findings challenge "extreme versions of the 'bureaucratic dominance' view" (p. 254), the book offers less insight

into the variations in industry influence over the policymaking process.

Mark Tilton's work on basic material industries offers a more nuanced argument on the interaction between private and public actors in Japanese industrial policy. Tilton seeks to challenge traditional economic and political science debates over the sources of Japan's success in phasing out sunset industries. He argues that the Japanese bureaucracy neither has been successful in responding to market signals in basic materials industries nor has always sought to do so. Unlike Uriu, Tilton explicitly focuses on trade associations in his conceptual framework. He also broadens the scholarly debate over declining industries to include the understudied area of basic materials industries, explicitly focusing on petrochemicals, cement, primary aluminum, and ordinary grade steel.

Tilton contends that Japanese trade associations turned to long-term interindustry relational contracts to mitigate the effect of market signals on basic materials industries. Driven by the desire to retain access to strategic materials, MITI officials supported these efforts at informal governance by turning to capacity and price cartels, joint-sales companies, and limited subsidies. In some cases, these steps effectively protected domestic production from import competition. Tilton notes that trade associations and their LDP supporters also pressured MITI into backing more extensive subsidies, often over the opposition of the Ministry of Finance.

Relational contracting—long-term ties between firms—lies at the heart of Tilton's analysis of informal governance. He extends the concept to include the efforts of trade associations to build support networks between industries. Tilton argues that the success of "interindustry relational contracting" depends on three necessary variables derived from "a large number of cases" of major declining industries reviewed in the book's final chapter (p. 13). Specifically, the upstream industry must be concentrated and must have some type of "technological hook," or the downstream industry must be cartelized or receiving import protection. The author notes that two additional variables are helpful, and three additional systemic variables work to facilitate informal governance. Tilton finds that these variables, especially the three necessary factors, help explain differences in successful informal governance among Japan's basic materials industries.

Aspects of the conceptual framework and the author's findings, however, are troubling. As with Uriu's analysis, the explanatory factors outnumber the cases being tested, which increases the difficulty of determining patterns of causality. Greater problems lie with the determination and testing of necessary variables. In chapter 7, Tilton briefly reviews twenty cases of declining industries from which he derives his three necessary variables. These declining industries include the four cases against which Tilton seeks to test his conceptual framework, raising questions of selection bias and the extent of the framework's explanatory power.

The potential for selection bias lies in the characteristics of the four cases versus the broader set of declining industries. Of the twenty cases of declining industries, only the basic materials industries offer examples of "successful, long-term informal protection" (p. 191). They account for eight of the nine examples of necessary upstream concentration, the only two examples of technological hooks (petrochemicals and steel), and the only four examples of downstream cartels/protection (cement, fertilizers, soda ash, glass). Tilton's primary cases deal with four concentrated, basic materials industries. Two of these have technological hooks, one (cement) has the requisite downstream connections, and one (aluminum) lacks both factors. His finding that the cases fit

the predictions of the model is, as a result of their influence on the larger sample from which the model is drawn, not surprising.

In conclusion, and critiques aside, all three works take the important step of moving the Japanese politics literature beyond its growing polarization. Insights lie in exploring the interplay among firms, organized labor, industry associations, bureaucrats, and politicians within the broader context of international relations. The research efforts in these books strengthen the literature on underexplored aspects of Japanese industrial policy through a detailed integration of extensive field research and primary source materials with the secondary literature.

How Russia Votes. By Stephen White, Richard Rose, and Ian McAllister. Chatham, NJ: Chatham House. 1997. \$24.95.

Public Opinion in Postcommunist Russia. By Matthew Wyman. New York: St. Martin's Press. 1997. 256p. \$65.00.

John Anderson, *University of Nebraska at Kearney*

These books read together represent a complementary effort to explain democratization in post-Soviet Russia. Together, the studies do much to enlighten us about the nature of Russian politics vis-à-vis the nascent public and the beginning steps of its development. As such, the books discuss social and political phenomena that should be of great interest to students of politics in general. Taken separately, the book by White, Rose, and McAllister offers an insightful narrative about the nature of Russian elections, especially as they have related to broader political changes in the country. In particular, *How Russia Votes* should be carefully read by students of comparative politics, development theory, electoral behavior, and public opinion. The book by Matthew Wyman explores public opinion in post-Soviet Russia, and its appeal will most likely be limited to political sociologists interested in Russian public opinion.

Wyman's book primarily recounts the findings of a host of public opinion polls taken in Russia. Unfortunately, Wyman's scope of inquiry was limited to polls taken between the late 1980s and 1993. This is unfortunate because the limited findings exclude many significant events of the postcommunist era in Russia. The election of the current Duma and Yeltsin's grab for presidential power both unfolded after the polls Wyman used had been administered and analyzed. Nonetheless, Wyman's monograph begins to explore interesting topics relating to the development and nature of public opinion in Russia.

How Russia Votes does not suffer from the malady of being too narrow in scope. In fact, this book has been praised by James Gibson (one of the publisher's reviewers) for being comparable to Campbell et al.'s landmark study, *The American Voter* (1960). He means to tell us that the book has a very broad reach that encompasses, in a meaningful manner, a complex of political and social phenomena. Gibson is also right in another regard: *How Russia Votes* makes an important contribution to our discipline because of its unique style. Much like *The American Voter*, the book deserves credit for its multifaceted nature. Mostly, White, Rose, and McAllister worked to integrate qualitative and quantitative research into a theoretically sophisticated analysis, that difficult task which always deserves praise.

On the quantitative side, White, Rose, and McAllister chiefly employed analyses of public opinion and electoral results. For data from survey research, they relied mostly upon the results of their own work on the New Russia Barometer (NRB) to analyze public thinking. The NRB was

instituted as an annual survey of social and political attitudes throughout the Russian Federation, and it has been labeled a "barometer" because it repeats questions to enable some measurement of changing attitudes (seeking continuity and discontinuity in individual political thinking). The authors also incorporated work by other pollsters when appropriate, such as the VTsIOM (a Russian public polling institution). To the authors' credit, they incorporated sophisticated statistical techniques into their overall discussion of Russian elections in a nearly seamless fashion. Far too often in the past, social scientists have used jargon-laden language when reporting important findings, but White, Rose, and McAllister avoided that difficulty by carefully wording their explanations.

It is also praiseworthy that the authors incorporated empirical findings directly from election results to strengthen their arguments about Russian electoral behavior. In electoral matters, their analyses were directed at several elections, including legislative and executive elections from 1989 through 1995 as well as the important presidential election in 1996. The authors' analyses of recent Russian electoral behavior were augmented by their addition of electoral results during Communist rule—dating back to 1922. This perspective of Russian elections allows them to explore issues relating to popular governance within the context of twentieth-century Russian history. This perspective helps readers understand Russian politics in a manner that is less sensitive to the narrow interests of recent times. In addition, it allows readers to better understand how debates in earlier times were open to issues relating to democracy and equality.

The authors notably incorporated qualitative information into their narrative as well. This is primarily taken from news sources, speeches, and other publicly available material. While the exclusive use of these limited forms of qualitative methods indicates the work lacks insight into some interpersonal relationships—like the kind of techniques which provide greater understanding of identity formation and acculturation—the inclusion of archival information does allow the authors to do more than speculate about their quantitative findings. They can build cases for the causes of institutional change and begin to explain the role taken by culturally based meanings in the development of modern, liberal democracies.

By weaving their sources into a narrative, White, Rose, and McAllister were further able to describe voting behavior and political struggles in Russia in some detail. Whereas other scholars often place themselves in narrow disciplinary structures, these authors were able to weave an insightful, provocative, and interesting analysis that attempted to detail many facets of social and political life in Russia. This is particularly true because the authors used sources of qualitative information to analyze institutional dimensions of political matters as they developed in Russia. Readers will be especially impressed by the way political culture, weak institutional norms, and unusual electoral behavior were combined to form a politics characterized by outright power struggles, often ignoring democratic norms of behavior we expect. Such insights should warn us about the nature of problems other nations may face when people begin to believe that elections and the rule of law do not matter.

Many other findings in *How Russia Votes* are worthy of mention. For instance, the authors note that democratization is a lengthy process because it requires changes in a country which shake its foundations. Those foundations are obviously institutional and less obviously cultural (including ways of thinking and acting) in their nature. Often the tendency is to approach these (and other) foundational characteristics as though they were mutually exclusive. White, Rose, and McAllister refrain from this much easier and less accurate form of analysis, instead explicating the characteristics of Russian political development within the more complex warp and woof of human existence.

To suggest that any book can be characterized by broad brushstrokes, lacking either flaws or worthwhile characteristics, is inappropriate. For instance, White, Rose, and McAllister ineptly apply rational choice theory to suggest that Russian political parties behaved irrationally in the 1995 Duma campaign (pp. 198–201). While I may share some of the authors' apparent disdain for rational choice theory, that does not justify the inappropriate usage of the perspective. Each theory of politics deserves to be applied in a manner consistent with its basic tenets. Unfortunately, the authors begin their analysis of rational electoral behavior by prescribing the rational outcome; in essence, they were trying to show that Russian electoral behavior was not rational and that the model did not explain behavior. The authors seemingly employed this approach to argument without considering how actions that did not fit their prescribed model could be seen as strategic actions within the rational choice paradigm (as suggested by the prisoner's dilemma). In addition, the authors might have considered how game theorists would argue that electoral behavior is best modeled as a reiterative game.

Turning back to Wyman's book, we find few similarities to the strength's exhibited in the White, Rose, and McAllister volume. Wyman's work is narrow in scope, method, and writing style. Nonetheless, the book complements *How Russia Votes* because it presents analyses of public opinion in far greater depth. For instance, Wyman examined ethnicity in Russia and its associated influences on public opinion. Similarly, Wyman's work leads readers to think more carefully about the important effect of rural/urban differences in Russia. It is the explication of detailed sociological phenomena that makes Wyman's book important enough that students of Russian politics and public opinion will want to read it. Others will find that *Public Opinion in Postcommunist Russia* adds support for the understandings built in *How Russia Votes*.

In summary, I would suggest reading both books because they complement each other. If time is a problem, however, then read *How Russia Votes*, since it is a far richer text and may one day be known as a classic in political science. *Public Opinion in Postcommunist Russia* will probably interest only a small circle of students and scholars because its frame and scope are limited. If time allows, readers should find that reading both books will add to their knowledge base, especially as related to public opinion and the influence of the social setting on the development of the Russian public and its attendant politics.

International Relations

Presidents and Foreign Policy: Countdown to Ten Controversial Decisions. By Edward R. Drachman and Alan Shank. Albany: State University of New York Press, 1997. 390p. \$19.95 paper.

Deborah Welch Larson, *University of California, Los Angeles*

How can we evaluate past foreign policy judgments of presidents? Too often scholars are swayed by their own political biases for or against a particular foreign policy. Retrospective judgments are also subject to hindsight. Analysts criticize a leader for failing to use information that was not available to him at the time, or for failing to predict events that could very well have turned out differently. Drachman and Shank present more objective criteria by which to evaluate past presidential foreign policy decisions. They sketch the foreign policy problem facing the president at the time, describe the options available, and explain why he chose one alternative rather than another. Their goal is to enable students to empathize with the president's position and to work through the problem as it must have appeared at the time. They then illustrate their evaluative framework in ten case studies of "controversial" foreign policy decisions.

At the outset, the authors state that they will evaluate the president in terms of how well he understood the historical context of the issue and applied that knowledge in making a specific decision. A president's options are necessarily limited by what his predecessors have done. The sequence of state actions in a region enables one to see whether the current problem is a significant break from past events. Continuities in behavior provide clues about the state's goals and intentions. The president should also consider the potential reaction of allies and whether the decision is consistent with his world view and national security strategy. Finally, in order for the policy to be implemented effectively and consistently, the president must have the support of Congress and the American people. Drachman and Shank assess the president's effectiveness in persuading relevant audiences of the merits of the decision. Finally, they consider whether a decision achieved the president's goals, both in the long and short term. The authors have provided a checklist of these factors for students to use in evaluating these and other presidential decisions.

Drachman and Shank assert that several decisions show evidence of the groupthink syndrome, in which the desire for unanimity overrides critical thinking and reality testing: the Bay of Pigs fiasco, Johnson's failure to end the Vietnam War after the Tet offensive, Nixon's decision to invade Cambodia, and Ford's approval of covert intervention in the Angolan civil war. The authors agree with Irving Janis's thesis that Kennedy approved the disastrous Bay of Pigs invasion because his advisers did not want to disturb the comfortable atmosphere of consensus by raising questions and doubts. But one wonders whether groupthink is essential to explaining Kennedy's decision to implement the plan, which was developed in the Eisenhower administration. Eisenhower did not give it his final approval because the CIA had not been able to find a Cuban exile leader who could organize the covert forces and lead a new government. Despite the absence of a popular exile leader, Kennedy did not object to the covert operation when he was briefed after the November 1960 election, before he held meetings with his advisers. By 1961 the CIA plan had developed bureaucratic momentum; calling off the operation would have led to politically dam-

aging leaks and protests from the Cuban exiles. Thus, Kennedy might have approved the Cuban invasion even if his advisers had pointed out potential problems.

The authors also do not show that Johnson was unduly influenced by apparent consensus among his advisers when he rejected the "Wise Men's" advice to end U.S. involvement in the Vietnam War. Rather, Drachman and Shank suggest that Johnson was following his customary decision style of choosing the middle course when he decided on a partial rather than a complete bombing halt in 1968 and pursued negotiations with the North Vietnamese without making concessions necessary for agreement. The authors indicate that Nixon, after discussion with his advisers, shifted to a more risky plan using U.S. forces as well as South Vietnamese troops to invade Cambodia. They are less persuasive in arguing that Ford approved covert U.S. intervention in the Angolan civil war in 1975 because of groupthink among his advisers; Kissinger took the lead in pressing Ford to approve aid to two factions.

While the evaluative scheme seems plausible and reasonable on the face, it does not always work well when applied to specific cases. In evaluating the consequences of a decision, one should consider whether feasible alternatives would have yielded a better outcome. For example, Drachman and Shank criticize Bush for failing to take advantage of the U.S. victory to destroy the Republican Guard or depose Saddam Hussein. But could U.S. forces have installed a replacement government without incurring unacceptable costs? Many of the authors' criteria conflict, forcing the president to make painful tradeoffs, for example, between pursuing his national security objectives and maintaining public support. But the authors do not prescribe how such tradeoffs should be made. When consequences are far removed in time and place from an initial event, many intervening steps could alter the final outcome, making it difficult for the analyst to draw a causal connection.

The book needs a concluding chapter, to sum up what we have learned about the factors affecting the quality of presidential judgments and to suggest areas of further research. The authors do not draw any generalizations about the conditions which promote good or bad decisions.

Presidents and Foreign Policy will stimulate the interest of undergraduates and provoke them to think in greater depth about problems of foreign policy decision making. The book would be useful to researchers on decision making as well, because the case studies are well researched, concise, and provocative.

We Now Know: Rethinking Cold War History. By John Lewis Gaddis. New York: Oxford University Press, 1997. 425p. \$30.00.

Miroslav Nincic, *University of California, Davis*

Not only is John Lewis Gaddis one of the most influential historians of the Cold War, but also he is a frequent critic of our own discipline. Almost as often correctly as not, he takes political scientists to task for failing to match methodological and theoretical pretense to relevant explanatory performance. While claiming no final word on the subject, his most recent book assesses the Soviet-American rivalry from the perspective of the post-Cold War era. In this regard, he successfully accomplishes what, thirty years previously, Louis Halle's *The Cold War as History* (1967) prematurely sought to do. A major advantage of writing several years after the Cold War's end is the possibility of comparing that chapter of history with other epochs, including a post-Cold War period.

In Gaddis's words, it stands to "place the Cold War within the stream of time; it will not confuse the Cold War with the stream" (p. 282). It also allows a proper degree of detachment, and it makes it easier to regard that period from the point of view of participants other than the United States (mainly the Soviet Union and China).

Benefiting, *inter alia*, from new material drawn from bulletins and working papers of the Cold War International History Project at the Woodrow Wilson Center in Washington, DC, the book deals principally with the superpower rivalry in Europe (Germany in particular), the Third World (especially Asia), and the nuclear arms race. It is a pleasure to read and, as far as a nonhistorian can judge, it is very competent historiography. The question here, however, is how valuable this volume is likely to be from the perspective of a political scientist.

Is there, to begin with, much of which those of us who study international rivalry have been unaware and which might make us revisit our assumption and theories? A little, but not much. Perhaps it is still too early to expect vast new quantities of exciting information, and, expectedly, the additions to factual knowledge Gaddis provides are somewhat at its margins. Still, many will find his coverage of the reasoning of participants in key Cold War crises useful. The chapter on the Cuban missile crisis does an excellent job of presenting the range of options Kennedy was really considering, debunking the belief that a nuclear exchange was very close at hand, and analyzing the inverted perceptions that Castro and Khrushchev had of what each was doing for the other. I was also intrigued to learn of the role that Beria had sought to play in resolving the German question after Stalin's death, and of Stalin's initial indifference to the Middle East, its geopolitical position notwithstanding. Virtually every chapter also presents an interesting exercise in counterfactual speculation, extending the range of contingencies many political scientists would have considered.

The second issue is whether the book contributes much of an explanatory nature—causal propositions that, applied to the Cold War, place its occurrence and trajectory in a new light. The author, as do most diplomatic historians, accounts for both minor and major events almost exclusively in terms of human agency—things happen because of what important people wanted and how they acted. There is very little appreciation of the need to account for the patterns of interest and power in which motivations are rooted and which constrain the scope of policymakers' ability to shape history. Where propositions of this sort are advanced, many political scientists may be tempted to sigh. There is, for example, frequent recourse to the explanatory power of "power vacuums," or to such things as the "hydraulic theory of geopolitics," according to which "dams built or dikes bolstered in some locations diverted the Soviet expansionist impulse to others." (p. 167). At the same time, Gaddis does a good job of analyzing the role of ideological values in major foreign policy strategies and how the two superpowers resolved conflicts between their values and interests.

Of course, these are the criticisms of a political scientist, while the book was written by a historian for an audience of which we are not necessarily the dominant members. In any case, our own discipline will continue to benefit both from the willingness of historians like Gaddis to probe our shortcomings and from the ever-improving store of factual information with which they provide us.

The North American Trajectory: Cultural, Economic, and Political Ties among the United States, Canada, and Mexico. By Ronald F. Inglehart, Neil Nevitte, and Miguel Basañez. New York: Aldine de Gruyter Press, 1996. 198p. \$40.95 cloth, \$19.95 paper.

Risking Free Trade: The Politics of Trade in Britain, Canada, Mexico and the United States. By Michael Luszti. Pittsburgh, PA: University of Pittsburgh Press, 1996. 180p. \$49.95 cloth, \$22.95 paper.

Christopher Sands and Sidney Weintraub, *Center for Strategic and International Studies*

Why is it that governments choose to pursue a course of trade liberalization? Scholars have offered a variety of answers ever since Adam Smith's *Wealth of Nations* (1776) and David Ricardo's *Principles of Political Economy and Taxation* (1817) made the case that international trade is good for nations, and therefore its promotion is wise policy. In these two books, the authors approach this theme from different perspectives and argue that trade liberalization, particularly in North America, may also be wise politically.

Lusztig examines various models of the decision-making process and argues that support for liberalizing trade is a second-order objective adopted by political actors as a by-product of the first-order objective of effecting a favorable political realignment of domestic interests. In any society some interests benefit from trade liberalization while others are harmed by the reduced scope for rent seeking. These groups may align themselves in support of common political coalitions within parties and within the polity. The economic costs and benefits of liberalizing trade are significant enough to redistribute this support, and so political actors who stand to benefit from this realignment adopt corresponding positions on trade. When in power, these political actors rationally pursue international agreements that bind the country to the consequences of liberalized trade and thereby attempt to confirm the new constellation of political support that benefits them.

Having laid out this model, Lusztig applies it to four historic cases, each of which is considered in a separate chapter. The cases are: the repeal of the Corn Laws in Great Britain by the government of Robert Peel; the adoption of the Reciprocal Trade Agreements Act in the United States with the strong support of President Franklin D. Roosevelt; the successful pursuit of the Canada-U.S. Free Trade Agreement (CUFTA) by the Canadian government of Prime Minister Brian Mulroney; and the decision to negotiate the North American Free Trade Agreement (NAFTA) by the administration of President Carlos Salinas in Mexico.

As one might expect when an author employs cases involving complex motivations, specialists in the politics of the four countries at the critical moments will likely disagree at several points with the interpretation given by Lusztig to the motives behind particular decisions. For example, in the case of Canada, Lusztig links the decision to pursue CUFTA, popular in Quebec and western Canada, with the Mulroney government's constitutional reform strategy designed to placate Quebec nationalists unhappy with the 1982 constitutional reform adopted by the government of Pierre Trudeau. The tenuous linkage Lusztig asserts between these two initiatives, never made publicly by the Mulroney government, raises a puzzling question: If the two initiatives were linked as parts of a strategy to build a lasting electoral coalition, then why did Mulroney choose to seek a mandate to adopt CUFTA in the 1988 federal election without attempting to secure as well a mandate for the swift ratification of the Meech Lake constitutional reform package by holdout provincial govern-

ments in that campaign (a move that arguably could have strengthened the government's efforts in this area)? In the Mexican case, Lusztig implies that Salinas pursued NAFTA as a by-product of the domestic Solidarity program for which Salinas sought the support of the masses. The argument for this reasoning is not overwhelming.

Lusztig is more successful in arguing the British and U.S. cases, perhaps because in these he is considering powerful countries that altered their policies toward weaker states, and so the primacy of domestic considerations is credible. In the Canadian and Mexican cases, the role of the predominant trading partner is not directly addressed, leaving unexplored the question of how changing the structure of bilateral relations beyond the economic sphere would influence domestic interests and the pattern of interest realignment in support of or opposition to trade liberalization.

Nevertheless, Lusztig's model of political entrepreneurship is valuable as at least a partial explanation for the decision by governments to pursue a strategy of liberalizing trade. For this reason the book will be of interest to readers seeking a conceptual framework for policymaking in the area of international trade.

Inglehart, Nevitte, and Basañez offer a model that also places trade liberalization behind other considerations for governments in North America. Yet, their argument is about more than the decisions that led to NAFTA; it is about three societies undergoing profound transformation driven by a process of economic integration that has intensified their interaction and introduced new tendencies toward convergence in the values and expectations of citizens in Canada, Mexico, and the United States.

In making such a daunting case, these authors deploy an impressive amount of data on individual values and attitudes drawn largely from the annual World Values Survey, itself based on the model of the Euro-barometer series. An appendix on the survey method includes some of the questions asked but is disappointingly brief in its description of the study design, instead referring the reader elsewhere for a more detailed presentation.

The authors argue that as values change over time, so do perceptions of national interests, and it is possible to see in the survey responses a pattern of movement with clear generational striations from materialist to postmaterialist values in all three North American societies. Looking at data from the early 1980s, the authors demonstrate that in many ways Canada, Mexico, and the United States were becoming more alike. Gaps in the three societies' attitudes toward sexual permissiveness/restrictiveness, respect for authority/individual autonomy, family duty/independence, religiosity/secularity, and civil permissiveness/order narrowed in the observed period. Of particular interest to the authors is the apparent decline of deference to authority and attendant distrust of political leadership in all three countries. This is linked directly to a decline in the ability of these governments to tell their citizens what to do, and a corresponding assertiveness on the part of the three publics in demanding things from their politicians. All three countries, the authors argue, are undergoing an epochal rebalancing of the roles of the state and the economy and of individuals and their society. Significantly, it is in this context that NAFTA was conceived and realized.

The authors contend that the data can be used to predict the future direction of the shift in values within and among the societies, and they make a compelling case by showing that the data from the 1980s foreshadowed the direction that attitudes would take into the 1990s. The next logical step is to look ahead, and to their credit the authors attempt to do just that in addressing the explosive issue of the political integra-

tion of the three countries. Carefully considering how attitudes toward the possible advantages and disadvantages of political union might translate into support for the amalgamation of the three societies, the authors conclude that the citizens of Canada, Mexico, and the United States may yet warm to this concept, and the idea cannot be easily dismissed.

The North American Trajectory raises intriguing questions about what is actually happening in contemporary North America and what the consequences of deepening economic integration in an era of high-velocity information flows might be. Regardless of one's attitudes toward continental integration, this book is a good read. Not since Louis Hartz (*The Founding of New Societies*, 1964) and Seymour Martin Lipset (*Continental Divide*, 1990) has such a wide-ranging and fascinating analysis been offered of the character and aspirations of the people of these three countries in a comparative context. This book is highly recommended for students and policymakers considering the direction that North American integration may take.

Tamed Power: Germany in Europe. Edited by Peter J. Katzenstein. Ithaca, NY: Cornell University Press, 1997. 328p. \$49.95 cloth, \$19.95 paper.

The German Predicament: Memory and Power in the New Europe. By Andrei S. Markovits and Simon Reich. Ithaca, NY: Cornell University Press, 1997. 248p. \$29.95.

Beverly Crawford, *University of California at Berkeley*

Since the Berlin Wall's collapse, the "German Question" has dominated debate about the future of Europe. Few need to be reminded that the growth of German power provoked two bloody wars in this century. The current question is framed this way: Will accelerated European integration subjugate German power to a united Europe? Or does it provide a veil behind which Germany exercises self-interested dominance, both in Europe and on the international stage?

These books will reshape the terms of that debate. Indeed, both point to the limitations of the question itself. Since 1949, Germany has accepted constraints on its sovereignty and military capability in ways unique in world history for an important European power. And contrary to many expectations, there is little evidence of pernicious German nationalism in current foreign policy. Indeed, Germany appears to have broken radically with the traditional practices of national sovereignty so common in large European democracies. Thus, both books address the more interesting puzzle: Why has the growth of German power *not* been accompanied by a return to the "normal" practices of great powers and sovereign states? What explains the "taming" of German power? They provide answers whose significance reaches far beyond these questions themselves.

In rejecting both realist claims, which suggest that Germany will maximize its power in Europe, and institutionalist arguments, which claim that Germany is constrained only by its commitment to multilateral institutions, these books offer new approaches to the study of foreign policy and international relations. They argue that culture and identity are primary forces driving the current policies of Germany as a rising power, offering pioneering perspectives that can greatly advance our understanding of the missing analytic link between international relations theory and foreign policy analysis.

Markovits and Reich stress cultural factors *within* Germany that limited the exercise of power, even as Germany's economic might has grown. Before unification, they argue, three forces constrained Germany's growing power: neigh-

bors who feared resurgent German aggression; Germany's inability to export its culture abroad; and Germany's unwillingness to use power, a reticence driven by an "ideology of reluctance." After unification the first two constraints were partially lifted. Others' acceptance of German unification suggests that old fears are buried. And Germany's ability to export its culture still remains limited. The decisive factor explaining German reluctance to maximize power is the ideology of reticence.

That ideology is explained by "collective memory," a potent ingredient in any nation's political culture and foreign policy tradition. While Germany's memories are multiple and clustered—memories of Weimar and the Bundesrepublik also mark public debate—the defining memory remains that of the Nazis' fatal exercise of power, the memory of Auschwitz. That memory now shapes a fear of foreign engagement. And as long as it defines political discourse, Germany, despite its predominance of regional power, will assume neither a position of malevolent dominance nor hegemonic leadership in Europe. The book's careful discussion of German reluctance to commit troops abroad despite vast military potential clearly supports the argument.

But although the memory of Auschwitz currently guides a reticent policy, Markovits and Reich argue, the future is uncertain. Identity rooted in collective memory can change as postwar elites die out and as competing memories rise to dominance. And lurking alternative memories open the door to a new German nationalism. Indeed, in the current period, they warn, "Germans are trading a European identity for a German one (p. 205)." We cannot be sanguine about the future of "tamed" German power.

Katzenstein and his collaborators disagree. More important than domestic collective memory, they argue, are external institutional forces shaping German behavior. Participation in European institutions defines German identity as explicitly international and particularly *European*. And that identity leads Germany to consistent pursuit of policies that support European integration even if they reduce German power or undermine its narrow interests. Because Germany's European identity is taking root in stable external institutions, its foreign policy preferences are increasingly multilateral. This process of identity and interest transformation tames German power now and will continue to do so.

For Katzenstein and his collaborators, deepening European institutionalization ensures that future. Multilateral institutions do more than constrain state behavior. They mold the identities of their participants. And identities do not change easily. This does not mean that all is rosy: A European identity includes heavy doses of xenophobia and exclusion. Recall that Germany buttressed its controversial push for Croatia's recognition with claims that Croatia was committed to "European" values; Serbs, according to the influential German press, were "hardly European at all." Katzenstein's point, however, is not that Germany's European identity will ensure regional peace but that a "nationalistic" identity is unlikely to reemerge in Germany as long as European integration continues.

This view contrasts with the uncertain future that Markovits and Reich envision. And that contrast goes to the heart of the debate between these two volumes. *Tamed Power* sees a constitutive role for institutions in the transformation of German identity and behavior. *The German Predicament* argues that institutions fine-tune the values and memories of dominant classes, but those values and memories lie at the root of ideologies shaping identity and policy.

This debate marks other disagreements, such as the issue of regional hegemony. The exact threshold of material cap-

bility necessary to achieve a hegemonic position—even a regional one—remains unspecified in the literature; how much power it takes to be a hegemon is now a matter of judgment. *Tamed Power* argues that because of its European identity, Germany sacrifices self-interest for multilateral cooperation in the *absence* of sufficient hegemonic capability. And because European institutions stabilize the region, hegemonic leadership is unnecessary. Markovits and Reich argue that Germany's material capabilities suffice for it to become a European hegemon, but due to its ideology of reluctance, it cannot make sacrifices required of a hegemonic leader. And Europe *does* need a leader.

A second disagreement concerns the international reaction to postunification Germany and the role of institutions in shaping that reaction. Markovits and Reich measure the neighborhood climate by examining responses to German unification. Others' initial reactions indicate long-term perceptions of German power and provide a basis for evaluating the claim that external forces—neighbors' fears—could trigger external constraints that explain Germany's reticence.

The authors found widespread acceptance of German unification, suggesting little apprehension of a resurgent Germany. These findings should silence those who argue that Germany's neighbors feared a new *Sonderweg* and therefore chained Germany more tightly to European institutions. Ironically, however, the fears others *did* express were defined less by memory of past German atrocities than by present realities of German economic power, their own economic dependence on Germany, and even German neglect of its old partners as it now looks eastward for economic opportunities.

Using different indicators, Katzenstein's collaborators found more varied responses to postunification Germany. Ironically, too, they found a greater role for the memory of Nazi atrocities in defining others' fear of Germany than did Markovits and Reich. But they found that those memories were activated *only under particular institutional conditions*. The extent of participation in EU institutions and domestic institutional compatibility with Germany greatly influence others' perceptions of German power. Without these institutional buffers, German relations with smaller European states are strained and World War II memories remain alive. Where buffers exist, relations are cordial, and institutional constraints are experienced as "soft." These constraints are also "soft" because German participation in European institutions defines German interests and identity. These claims are buttressed by exhaustive case studies that present new and important empirical material, particularly on Europe's smaller states.

How can we assess the relative strength of these competing arguments? Markovits and Reich present a pluralistic palate of competing German memories which may all vie for dominance when a new political generation takes the helm. We have no way of telling *which* collective memory will come to dominate or why a new political elite may pursue more nationalistic policies. And because almost any future policy trend can be traced to a particular memory, the argument is difficult to falsify.

Similarly, although the argument of *Tamed Power* rests on comparative case studies, permitting some factors to remain constant while others are examined, the institution/identity explanation is marred by the supposition that the European identity of France and Britain is weaker than that of Germany. No explanation for this variance is offered that is consistent with the argument. Why does institutional participation shape Germany's identity more than that of other large European powers? Although Katzenstein hints that institutional compatibility explains the variation (but does

not explain why Germany's institutions are more compatible with EU institutions than those of France or Britain), he ultimately relies on realist notions of self-interest and power balancing: France calculates that it can relinquish regional control from Paris to gain control in Brussels, and Britain's geographical location leads it to continue the role of power balancer in Europe, undercutting the power of European institutions to shape British identity. What prevents Germany from falling prey to similar forces? Perhaps it is because current German identity and European institutions were mutually constitutive. France and Britain helped reconstruct German identity through those institutions, while their own national identities remained intact; thus their more self-interested behavior. Postwar legacies, therefore, may explain more about identity formation than institutional participation.

Neither book claims that it will scientifically "test" its argument. Each admits that its evidence is illustrative, not conclusive. The strength of each is the construction of an analytic framework to explain the puzzle of German power. A complete test of the argument is neither book's aim and is rightly left to future researchers. Nonetheless, the empirical material presented suggests that Germany's behavior is subject to equally valid alternative interpretations.

Some of that material even supports neorealist or neoliberal institutionalist claims. Markovits and Reich caution that Germany exercises its preponderant power inadvertently, occasionally triggering crises like the 1992–93 ERM breakdown or the bitter dispute over Croatia's recognition: Germany seemed to behave like a "normal" power, even exercising dominance. This behavior, though now the exception, is subject to realist interpretations. Jeffrey Anderson argues in *Tamed Power* that Germany's attention to relative gains since unification is increasingly evident, a finding that could support some realist predictions.

Katzenstein argues, however, that what escapes realists is that Germany's "self-interest" is no longer a national self-interest. The "self" has become the idea and the region of Europe, and much of Germany's behavior is consistent with this broader view of identity and interest. But it is also consistent with a liberal institutionalist version of hegemonic stability theory, which suggests that dominant liberal states identify their self-interest with the stability of the system in which they operate; they sacrifice narrow self-interest to achieve it. If Germany's European identity is stronger than that of other powerful EU members, then why is Germany's structural position of European dominance not the key factor shaping its European behavior?

Neither approach specifies the conditions under which Germany acts in narrow self-interested ways and the conditions under which it is reluctant to do so. And the conditions that are specified are not consistent with the arguments. Concurring with other analysts, Katzenstein agrees that narrow self-interest is expressed more frequently when EU institutions are weaker and less frequently when institutions are stronger. But if European identity is to have independent explanatory status, it must be a more powerful force than the particular institutions that give birth to it. Otherwise the argument comes dangerously close to liberal institutionalism. Similarly, Markovits and Reich's explanation of Germany's "bull in the china shop" behavior is not consistent with the collective memory argument. Why the memory lapse?

These issues, however, do not weaken the significance of these important books. Both contribute major analytical statements and compelling challenges to the conventional wisdom. As Markovits and Reich note, "the debate about German power will be lively and unfettered" (p. 204). These

two intriguing arguments provide the opening salvos and set the terms for that debate. They will long be crucial sources for any attempt to comprehend Germany's European role in the twenty-first century.

Economic Incentives and Bilateral Cooperation. By William J. Long. Ann Arbor: University of Michigan Press, 1996. 151p. \$39.50.

Gerald L. Sorokin, *University of Iowa*

Almost every introductory textbook in international relations begins by discussing two things: how the agenda of international politics has grown in recent years as new problems arise and new actors enter the political arena, and how technological developments both increase the cost of conflict and create opportunities for cooperation. But simply recognizing the changes in the agenda and the role of technology is not the same as developing and testing theories to account for these things. Nor is it sufficient as a guide for policymakers. What we need is systematic research into problems and policies—some new, some familiar—that have been largely ignored in the scholarly literature. Long's book is a laudable attempt to do just that: He tackles a problem (how to bring about cooperation) and a policy (the provision of economic incentives) that are not well understood. Although Long's short book is far from the final word on this subject, it provides a useful starting point.

The book is organized around a theoretical chapter and three case studies. Long's principal theoretical argument is that a state offering economic incentives, such as preferential trade or technology transfer, in exchange for political compliance may be better able to exact concessions than if it applies economic sanctions. According to Long, a key difference between the incentive and sanction strategies is that domestic constituencies in both the sending and receiving state are more likely to support incentives. In the sending state, for example, "exporters and investors take a growing interest in the gains from trade and technology associated with new or expanded commercial relations" (p. 25), which leads them to support the policy. Moreover, unlike sanctions, incentives "are not, per se, an affront to recipient state sovereignty, [which makes them] more likely to penetrate the state and shape the process of preference formation within the recipient state's society" (p. 28).

Long's theoretical story is plausible, though the hypotheses to which he repeatedly refers are never explicitly presented. This omission makes it difficult to contrast his argument with one based on a structure of international payoffs. That is, it is difficult to know whether and when his predictions are consistent with those of an international-based argument and, therefore, whether the empirical evidence confirms or disconfirms his expectations. Furthermore, Long claims that his theory helps overcome some of the shortcomings of a game theoretic approach to questions of cooperation. I am unconvinced: Even if the criticisms of game theory that he cites are correct—and they are, at best, weakly so—his theory suffers from some of the same problems. For example, he accepts Robert Jervis's argument "Realism, Game Theory, and Cooperation," *World Politics*, April 1988, pp. 317–49) that a weakness of game theory is that it takes players' preferences as predetermined. While Long's attempt to look inside the proverbial black box is a step in the direction of understanding motivations, he can easily be criticized for taking substate preferences as given. I am more likely to be persuaded by a game theoretic model in which state leaders react to both internal and external interests than an informal

argument in which relationships among actors and variables are not laid out explicitly.

Long illustrates the theory with case studies of U.S. attempts to exercise influence through economic incentives. His three cases—relations with Sweden concerning nuclear power beginning in the 1950s; relations with China between Deng's 1978 visit to the United States and the first high-level military exchanges in 1986; and relations with Czechoslovakia after the fall of the Communist regime—are similar, in that they all involve the application by the United States of economic incentives, with mostly successful results. The problem with the case studies is not that they are poorly researched or written—they are neither—but that there is no way to generalize from them. Long makes several references to U.S. policy toward Iraq in 1990, a case in which economic incentives, to the extent they were implemented, failed to produce changes in the target state's behavior. A chapter on that case, or another failure, would have helped make the inferences he draws in his conclusion more convincing.

Similarly, since Long is interested in international politics in general and not just U.S. foreign policy, it would have been helpful to read about a case in which the sender was a country other than the United States. Long realizes that U.S. interests, capabilities, and behavior are not typical. But without sufficient explanation he extrapolates from his case studies, saying that "incentives may be equally or more important policy instruments for other countries" (p. 81). Perhaps, but incentives may also be less important to other countries, especially when they are too weak economically to offer concrete rewards for compliance.

As Long points out in his conclusion, a large-N study would be a useful complement to this book. I do not agree with him, though, that "the relationship between the sender's market power and the success of attempted incentives might be operationalized without great difficulty" (p. 94). It is the very complexity of the political and economic environment that would make such a relationship difficult to measure. Indeed, if Long's book teaches researchers one thing, it is that adding new variables and actors to our models makes it harder, not easier, to draw convincing conclusions. For policymakers, Long's book provides some useful examples and, by implication, suggestions for making better use of the range of policy instruments at their disposal. I hope both communities take advantage of Long's work and that the study of incentives continues to develop.

Internal Factors in Russian Foreign Policy. By Neil Malcolm, Alex Pravda, Roy Allison, and Margot Light. New York: Oxford University Press, 1996. 356p. \$72.00.

Russian Foreign Policy: From Empire to Nation-State. By Nicolai N. Petro and Alvin Z. Rubinstein. New York: Addison-Wesley Longman, 1997. 347p. \$31.95.

From Empire to Anarchy: Postcommunist Foreign Policy and International Relations. By Mette Skak. New York: St. Martin's Press, 1996. 340p. \$55.00 cloth, \$18.95 paper.

James M. Goldgeier, *George Washington University*

During the Soviet period, the classic approach to studying Moscow's foreign policy was embodied in the title of Adam Ulam's *Expansion and Coexistence* (1968, 1974). Scholars typically wrote about a tension between those factors, such as political culture or ideology, that they believed drove an expansionist foreign policy and those factors, such as the constraints imposed by the international system, that were seen as restraining any desire to build a larger empire or to promote world revolution.

With the collapse of the Soviet Union at the end of 1991, authors have continued to address these age-old questions: Is there something about Russian culture or geography that will lead to continuity in foreign policy, or will change occur due to a new international environment and a new domestic structure? Most important, how will a postimperial Russia define and pursue its national interests?

In this vein, two key questions are asked by these three works. First, will Russia become "normal"? By that analysts typically mean will Russia forgo imperial claims on the other New Independent States (NIS) and interact with them on the basis of respect for their sovereignty? If the answer is yes, then Russia would respond to opportunities and threats as a traditional territorial state, trading with its neighbors and allying with some of them in order to increase its security and prosperity, but it would not attempt to reintegrate these states either economically or militarily as occurred during the tsarist and Soviet periods. If one believes that the answer is no, however, because certain internal impulses lead naturally to Russian expansion, then the current period is merely an interlude between imperial systems, as was the case between 1917 and 1922.

The other key question asked in these books is: Who makes Russian foreign policy? We want to know how much power the president has to set foreign policy priorities, what role the Duma and Federation Council play, whether regional governments conduct their own foreign policies, when different ministries inject themselves into the process, and how the bankers and industrialists shape Russian interests. Over time, we should see more use of comparative approaches to give greater analytic clarity in the study of this particular state, and the volume by Malcolm and others will be a valuable resource for anyone engaged in a comparative effort to understand the influence of domestic structures, political parties, public opinion, and civil-military relations on a state's foreign and security policy.

The most interesting questions raised by each of these works concern Russian attitudes and policies toward the other NIS. The radical shift in foreign policy toward the West had begun, of course, with Mikhail Gorbachev's redefinition of Soviet interests, and thus there was less of an abrupt transition on those foreign policy issues after the Soviet Union's collapse. But dealing with the former imperial possessions has been much more difficult psychologically and materially, and this issue is at the heart of the definition of national interest. Formulating foreign policy toward former constituent republics is much more difficult for the elite and the public than any other external affair.

For thinking about these and other issues of Russian foreign policy, any graduate seminar would benefit from the inclusion of the volume by Malcolm and others, and one can only hope that Oxford will issue the book in paperback so that students can afford to purchase it. While not providing any overarching social science analytical framework for why certain outcomes emerge or for how to weigh the role of different internal factors, this volume is extremely well researched and informative. The basic problem for the Russian elite is defining what Russia is and why, and then what to do about it. This book provides insight into the debates that have taken place within the elite, among the masses, and between civilians and the military on issues such as policy toward the West and toward the other NIS.

The book argues that within Russia there have been three basic groups, which the authors label the Liberal Westernizers, the Pragmatic Nationalists, and the Fundamentalists, and that over time elite consensus has emerged around the centrist view. Malcolm and colleagues believe

that the Liberal Westernizers, such as Foreign Minister Andrei Kozyrev, were discredited over time for promoting Western-oriented policies that became viewed as exploitative of Russia, and President Boris Yeltsin, who held this view in 1992–93, moved to a more “pragmatic” position during 1994. The Fundamentalists Nationalists, whose most extreme proponent is Vladimir Zhirinovskiy, have proposed the reintegration of the old empire and virulent anti-Western policies that are appealing to only a small segment of the elite and population. Thus, Malcolm and colleagues believe that a consensus around a more “realist” Russian foreign policy—good relations with the West but also some distance and influence but not control over the other NIS—is emerging as the driving force behind Moscow’s approach.

After Margot Light traces the evolution of these three views and their manifestation in certain key Foreign Ministry documents and in the commentaries of Russian political observers, the succeeding chapters by Malcolm, Pravda, and Allison look at how these views are expressed by the key institutions in Russia, by political parties and public opinion, and by the military. There are excellent sections on the evolution of successive drafts of the Foreign Ministry’s key concept paper (pp. 61ff), on the perspectives of the different political parties (pp. 172ff), on the role of the military (pp. 251, 264, 274–5), and on the problems of identity (e.g., p. 289). The chapters are uniformly well written and well researched.

One can certainly take issue with the definition of the three camps and with the authors’ conclusions on how foreign policy has evolved. Since only the Fundamentalist Nationalists have an ideology, as Light herself notes (p. 43), “it is easier to detect an entire world-view in their discussions of foreign policy.” One could also place the emphasis not on a general convergence to some centrist position but rather on a continuing Western orientation that has existed since 1987 despite a failure by the Group of 7 to deliver much of the economic assistance promised and despite policies such as NATO’s intended expansion. Pravda’s chapter on public opinion points to the relatively large consensus in the electorate against reintegration of the NIS and on good relations with the West. It is that continuing tendency and the public support for such policies that one might wish to emphasize and seek to understand in analyzing the post-1991 period.

The book shows convincingly that the elite and the public have not been able to come up with a coherent agenda for interacting with the former imperial possessions given tremendous uncertainty about what would best serve Russia’s interest. Some individuals favor greater integration for security or economic reasons or for reasons of identity, but others oppose integration for the same reasons, and in particular due to the costs that would accrue. There has also been tremendous debate about the legitimate use of force, especially after the Chechnya debacle, although action in some areas, such as Tajikistan, has been viewed as necessary for Russian security.

The lack of attention to the internal divisions on this issue and to the importance of these divisions for identity formation and for the coherent pursuit of interests is the major shortcoming of the Petro and Rubinstein volume. This book, which is otherwise valuable as an undergraduate textbook, tries to get students thinking about the issue of continuity and change in Russian foreign policy. But as a textbook, it has two fundamental flaws that one hopes could be addressed in any succeeding editions and that are highlighted by the sections on Russian foreign policy toward the other NIS. One is ascribing to the Russian government a single foreign policy impulse toward the region, a myth which is effectively de-

stroyed by the other two books reviewed here. Petro and Rubinstein argue, for example (p. 116): “By integrating all the CIS states into a customs union, Russia hopes to bind them closely to the Russian economy and to strengthen the strategic partnership between these states.” Such statements fail to acknowledge both the lack of coherence in Russia’s policy and the lack of implementation of CIS agreements.

The second problem is the use of terms better left to Russian imperialist tracts than to Western texts: “near abroad” and “the Ukraine.” It is true that it is hard to find a good term for this part of the world. Not all countries are in the Commonwealth of Independent States (CIS). After a certain period, these New Independent States will no longer be new. Former Soviet Union applies to their origin but not necessarily to their trajectory. The problem with the term “near abroad” is that it is used by the Russian elite in ways that suggest a sphere of influence. Malcolm and others decided to use “near abroad” with the quotation marks throughout their volume, and that is preferable to simple use of the Russian terminology. Regarding “Ukraine,” there is no excuse for the term in a book published in 1997; it is an independent state, no longer the frontier of the empire, and it should not be labeled “the Ukraine” in discussions of events after December 1991.

Otherwise, Petro and Rubinstein have a nicely organized volume. They present a concise account of the Soviet period, giving an overview of the revolutionary ideals, the nature of Stalin’s foreign policy, and the contours of the Khrushchev and Brezhnev periods. In discussing each, they stick fairly close to the conventional wisdom on topics such as the nature of Stalinism and Soviet policy toward Eastern Europe under Khrushchev and Brezhnev, and this approach works well in a textbook. (Although in adopting the typical dichotomy between ideology and national interest, they forget that ideology helps define national interest.) Gorbachev is treated in a cursory fashion in the introduction, but he is discussed further in the more thematic chapters, which include policies toward Europe, Asia, the Middle East, the CIS, security and arms control issues, and international organizations.

Rather than cover foreign policy thematically across regions or issue areas, Skak takes the interesting tack of focusing on foreign policy in a postimperial space. Her discussion of the Soviet past concentrates on empire building, not general foreign policy, and her three post-Cold War foreign policy cases are Russia (the center), Lithuania (part of the inner periphery), and Hungary (part of the outer periphery). Skak knows her cases extremely well.

Thinking about the effects of empire on the foreign policies of the postimperial center and periphery could have made for an analytically interesting volume. But Skak tries to cover every potentially relevant concept, model, and theory in social science. In the first chapter she discusses anarchy, empire, praetorianism, corporatism, and consociational democracy, and she follows that with a chapter covering every model ever used to study the Soviet system. Having done so, she declares what has become obvious: “As the reader may have noticed I have tried to link myself to nearly all of the explanations mentioned here, not just totalitarianism. From the point of view of analytical clarity this sounds like a very frustrating outcome—a case of overdetermination, not to say explanatory overkill” (p. 134). Well said. Books should have a clear direction, with concepts, models, and theories serving to illuminate, not obscure. And the lack of a clear framework shows when Skak abandons a discussion of postimperialism in her treatment of Hungary. Having not developed a clear model at the outset, she has nothing to apply to that case. But

the reader who concentrates on her empirical material will be rewarded.

Malcolm and others and Skak provide rich material for area specialists and comparativists. With the development of political parties and movements, tensions between president and parliament, and the issues of postimperial development and the construction of national identity, Russia and the other NIS are interesting cases for thinking about general problems of state building and foreign policymaking. After all, how these states are even building the necessary institutions to manage complex economic and security foreign policy problems is an important subject for scholars of comparative politics and international relations.

Eisenhower and the Missile Gap. By Peter J. Roman. Ithaca, NY: Cornell University Press, 1995. 264p. \$35.00.

Eisenhower, Kennedy, and the United States of Europe. By Pascaline Winand. New York: St. Martin's Press, 1996. 432p. \$17.95.

Meena Bose, *Hofstra University*

Research on the Eisenhower and Kennedy presidencies has benefited greatly from the growing declassified records on both administrations in the past fifteen years. Based on these records, scholars have reevaluated initial appraisals of the two presidents' decision-making processes as well as their actual policies. Roman and Winand solidly contribute to this literature by reinforcing and at times raising new perspectives on previous analyses.

Roman's study of the missile gap focuses on the final years of the Eisenhower administration, from the launch of the Soviet satellite Sputnik in October 1957 to Kennedy's inauguration in 1961. The book examines the development of Eisenhower's strategic nuclear policies during this period, focusing both on their content and on the policymaking processes behind them. In so doing, it builds upon the literature on foreign policy decision making and bureaucratic politics as well as scholarship on the Eisenhower presidency.

As a whole, this book is well researched and will be of interest to students of Eisenhower and of American foreign policy. Roman focuses on four aspects of nuclear policy that became top priorities after Sputnik: intelligence assessments, national strategy (basic national security policy) and nuclear strategy (force posture and operational plans), defense budgets, and nuclear weapons choices. In examining these subjects, Roman presents a thoughtful and considered reappraisal of earlier studies. For example, scholars typically maintain that Eisenhower resisted pressures to increase defense expenditures after Sputnik because classified U-2 information clearly contradicted Soviet claims of nuclear superiority. Roman holds that the evidence actually was not so definitive, and while Eisenhower did limit defense spending, he also initiated the strategic buildup that typically is seen as originating in the Kennedy administration. These arguments provide a fuller picture than we have seen of Eisenhower's efforts in this period.

Roman's arguments about Eisenhower's leadership skills raise important points as well but cover familiar ground. One central claim is that while Eisenhower successfully kept defense budgets from escalating during his final years in office, despite strong disagreements within his administration, he did not effectively communicate his rationale to Congress and the public: "Eisenhower's success in the administration was not matched outside the administration" (p. 207). But other scholars have made this argument as well, notably McGeorge Bundy (*Danger and Survival: Choices*

About the Bomb in the First Fifty Years, 1988, pp. 334-50), Greenstein (Preface, *The Hidden-Hand Presidency*, 1994), and Divine (*The Sputnik Challenge*, 1993). It is particularly surprising that Roman does not cite the latter work, though this is difficult to confirm because his book lacks a bibliography. The Divine and Greenstein sources may have been published after Roman's book went to press, but it is nevertheless evident that critiques of Eisenhower's political skills during the missile gap debate date back at least to the late 1980s. Roman's analysis explains the point well through a detailed study of post-Sputnik defense budget deliberations, but it does not present a new perspective.

In concluding that Eisenhower's nuclear policies leave a "mixed legacy" (p. 197), Roman continues a long-running debate. He finds that Eisenhower initiated efforts to develop second-generation strategic missiles and thus holds Eisenhower responsible for the "large, secure, and redundant strategic nuclear triad" (p. 193) of bombers, ICBMs, and SLBMs. But the massive buildup of strategic nuclear forces took place during the Kennedy administration, as Ball's *Politics and Force Levels* (1980) explains. Furthermore, Roman suggests that Eisenhower initiated these developments "just as fears about the existence of a missile gap were beginning to subside" (p. 200). Yet, the missile gap debate played a major part in the 1960 presidential campaign. If one accepts Roman's position that U-2 information in the late 1950s was inconclusive, then it becomes even more evident why Eisenhower decided to build up strategic forces. Given the political pressures he faced, it is indeed surprising that he limited the buildup as much as he did. Roman's criticisms of Eisenhower's policies raise the question of what the president might have done differently.

A few minor points about the organization of the book should be noted. Charts outlining the changes in defense budgets and nuclear weapons between 1957 and 1961 would have helped illustrate the detailed analyses of each. The introductory chapter should give some indication of the author's thesis or discuss more explicitly the questions that guide the analysis. Instead, it contains a lengthy review of the literature on presidential power, bureaucratic politics, and Eisenhower, much of which could have been condensed. The author's own interpretations of nuclear policy and decision making during Eisenhower's final years in office are of most interest, and those views merit a higher profile.

Winand's book examines European integration efforts during the Eisenhower and Kennedy administrations. It uses both archival research and elite interviews to produce an exhaustive study of such subjects as the European Defense Community, Euratom, the Common Market, and the Multilateral Force. Material from European archives along with the author's personal interviews especially provide new and authoritative information on European-American relations in this period.

Given the ambitious scope of the project and its length, it is surprising that the study does not contain more of an analytic structure. Winand's purpose is to portray "the American administration's attitudes towards the unification of Europe, and the continuous dialogue between American supporters and opponents of European integration, and their European counterparts" (p. ix). This subject merits attention, Winand explains, because it "will help contribute to a better understanding of how patient and determined individuals bring about such changes" (p. ix). Yet, the book provides no conclusions about which individuals were most important in this period and why. Indeed, it lacks a real concluding chapter, as the epilogue discusses how the Johnson administration addressed efforts begun under its predecessor.

Winand acknowledges from the outset that the study may contain "an unnecessary wealth of detail" (p. xii) but maintains that this information is needed "to provide a more lively and accurate account of events" (p. xii). Her point is well taken: The difficulty is not the amount of detail but the lack of a framework to review and assess it. At the very least, the number of European organizations and initiatives examined merits a timeline to help the reader keep track of when each proposal is presented. Individual chapters could use introductory and concluding sections that explain what each will examine, why the subject is important, and the author's conclusions about the initiative and U.S. and European actions. In addition, the introduction needs to provide a road map for the book as a whole.

Perhaps the greatest strength of the book is its careful illustrations of the policymakers involved in European integration efforts. Winand devotes an entire chapter to explaining the views of Kennedy administration officials, including George Ball, Walter Rostow, and McGeorge Bundy, and her meticulous descriptions provide a useful basis for understanding the administration's actions. A parallel chapter on Eisenhower administration officials would have served the book well. Winand also examines the views of such European leaders as General Charles De Gaulle and Jean Monnet, but these studies appear within the substantive chapters on specific initiatives rather than separately. A chapter on each U.S. administration's top officials and their European counterparts might have provided more easily accessible references. Of the specific initiatives examined, the chapter on the early efforts of the Roosevelt and Truman administrations is especially instructive, providing useful background material for the chapters that follow.

This study does not attempt to provide a theoretical argument for understanding European integration efforts, perhaps because Winand aims to address not only students and researchers but also "a larger public outside of academe" (p. x). But readers who are not experts on the subject will want to see more forest in this work for all the trees. For example, the book is particularly timely because of current initiatives for European monetary and political integration. Winand herself notes that "Washington has dusted off the idea of a partnership between the United States and a tightly integrated European Community, which Kennedy advocated some thirty years ago" (p. xvi). Yet, she does not provide a fuller explanation of how efforts today are rooted in initiatives from the 1950s and 1960s. It is unfortunate that the book does not include such broader analysis, for it is a fine study that contains much fascinating detail.

Both of these books will serve as valuable reference tools for scholars studying or teaching about these subjects. As such, they provide important contributions to the burgeoning literature on American foreign policy during the Eisenhower and Kennedy administrations.

The Once and Future Security Council. Edited by Bruce Russett. New York: St. Martin's Press, 1997. 179p. \$39.95.

Paul F. Diehl, *University of Illinois, Urbana-Champaign*

The end of the Cold War has renewed serious attention to the issue of the reform of the United Nations Security Council (and indeed the United Nations in general). Various proposals have been advanced to change the decision-making powers or structure of the Security Council, although the greatest attention has been directed to changing the composition of its membership or altering the status of the five permanent members. Proposals include increasing the coun-

cil from its current 15 to various membership sizes of 20–30 as well as initiatives to give permanent membership (and veto power) to Japan, Germany, and/or some Third World state. This slender volume from the United Nations Studies program at Yale University brings together eight chapters of essays and empirical analyses that deal with various aspects of reform proposals for the Security Council. Although four chapters have appeared in earlier versions in leading journals in the profession, the collection does make a value-added contribution by the additional four chapters and the coherence of reading the chapters together and in sequence.

The opening chapter by James Sutterlin provides a historical overview of politics and values underlying the creation of the Security Council in the 1940s (and beyond). There is little new here for scholars of international organization, but this chapter provides a vital baseline for understanding the current parameters of the Security Council. The second chapter, by Bruce Russett, provides another kind of baseline, offering ten "balances" on which to weigh various UN reform proposals; for example, the balance between enforcement and neutrality is especially critical as the UN has seemingly lurched from one extreme (neutrality) in its early peacekeeping efforts to the other (enforcement) in contemporary manifestations of peacekeeping. The only problem with this chapter is that several of the balancing criteria seem more applicable to UN reforms other than those involving the Security Council.

The edited collection also strays a bit from its central theme in the third chapter, an empirical analysis of voting patterns in the UN General Assembly by Soo Yeon Kim and Bruce Russett. Except for a brief discussion of the Security Council at the end of the article, it is not always clear why and how this chapter is relevant for reform of the Security Council. Nevertheless, this chapter and its successor, by Barry O'Neill, are representative of the revival of a solid tradition of UN voting studies that had become almost moribund over the last twenty years in the scholarly community. Kim and Russett's results provide new knowledge to the field about the relevant clusters (mainly a strong North-South cleavage) that characterize post-Cold War voting patterns at the United Nations; previous analyses of General Assembly voting patterns are all now obsolete. O'Neill's is a superb analysis of the implications of various voting schemes for the Security Council. He looks not at raw voting power but at power over outcomes and satisfaction with outcomes. There are a number of counterintuitive conclusions (i.e., expanding the number of nonpermanent members is not likely to make any difference in the council) that illustrate the synergy which can occur between good theoretical and policy-relevant research.

The fifth chapter, by Nigel Thalakada, looks at China's voting patterns in the Security Council from 1990–95. Although China has not exercised its veto power since 1989, it has an unusually large number of abstentions since then, and even its support of UN resolutions has often been qualified. Thalakada's analysis helps us understand these behaviors, although China's narrow views of sovereignty and quest for Western aid and investment may not account for all its actions or necessarily give us clues about its future behavior. Masayuki Tadokoro provides a Japanese view of Security Council restructuring, but this is more a reflection of the author's heritage than a viewpoint necessarily representative of the government or people of Japan. He proposes four changes to the Security Council (such as new veto members and broader focus) that are an amalgamation of many of the suggestions offered in various political circles and therefore not necessarily new or innovative. Ian Hurd's following

chapter is a welcome move away from an almost exclusive focus on voting structure and patterns. Hurd emphasizes the "informal" aspects of Security Council decision making. Among other points, he argues that there has been a blurring of the distinction between members and nonmembers of the council and that extensive consultations among a range of states occur; this further suggests that merely expanding the number of seats on the council may not change the form or outcomes of council deliberations.

The concluding chapter, by Russett, Sutterlin, and O'Neill, lists six suggestions for changing the Security Council. Read on their own, these ideas seem remarkably limited in ambition and scope. Yet, in the context of the preceding chapters, they seem eminently reasonable and realistic, and they may find their way into practice in the not too distant future.

For one-stop shopping on Security Council reform, this is a handy little book. Unlike most edited collections, it is more valuable if one reads all the chapters rather than one or two highlight chapters. The staying power and importance of the collection is likely to be limited, however, especially if the Security Council reform advocated by the authors actually occurs and thus renders moot the issues and discussion.

The Endangered Atmosphere: Preserving a Global Commons. By Marvin S. Soroos. Columbia: University of South Carolina Press, 1997. 339p. \$39.95 cloth, \$19.95 paper.

Marian A. L. Miller, *University of Akron*

The Endangered Atmosphere is an intelligent contribution to the discussion of the regulation of the global commons. Marvin Soroos places his examination of the atmosphere within the context of the commons, and he analyses it through the lens of security policy. His study underscores the crucial role of international regulation in addressing atmospheric degradation, and it also highlights the complex and untidy nature of the regime process, complicated as it is by considerations of economics, efficiency, and equity.

The book is organized around an examination of the regimes for atmospheric testing of nuclear weapons, long-range transboundary air pollution, the depletion of the ozone layer, and global climate change. These cases are preceded by a primer on atmosphere and pollution and a discussion of scientific knowledge. With its information on the characteristics of the atmosphere and the nature of the pollution threats, the primer is intended to help readers understand the related policy issues. The discussion of scientific knowledge includes an examination of the development of scientific cooperation and the role played by international scientific programs in each of the four issue areas.

The examination of the four cases is followed by an exploration of the commons issue and a treatment of environmental security. The commons chapter discusses the atmosphere as a global commons and assesses the extent to which the atmosphere matches the commons described by Garret Hardin ("The Tragedy of the Commons," *Science* 162 [December 13, 1968]:1243-8). The succeeding chapter places pollution concerns in a security context and assesses how this context may affect the strategies people use to address atmospheric degradation.

Soroos points out that although the atmosphere cannot be properly classified as common property, it is a common resource. His examination of the four cases within the larger integrative framework of the atmosphere provides us with an enhanced understanding of the factors driving the degradation and preservation of the global commons. His organization of the cases allows for examination of the regimes along

the following general lines: historical context, emergence as global or public issue, creation and evolution of the regime, compliance, and effect. The organization facilitates useful comparisons of the various environmental problems and public policy responses. It also enhances observation of the science and policy interrelationships among the cases. In addition, the chronological treatment of the cases offers the reader a sense of the learning curve in the development of atmosphere-related regimes.

It would have been useful to see some small additions to the treatment of the climate change and the transboundary air pollution regimes. While the evolution of the climate regime is clearly presented, the examination of the role of economic actors is limited. Since global warming is substantially driven by industrial development, corporate actors have a major stake in the evolution of that regime. It would have been illuminating to have an assessment of the extent to which they are likely to shape the regime's evolution. Some corporate actors, like insurance companies and petroleum corporations, have particular stakes in this issue. As an atmospheric issue, transboundary air pollution is properly included with the other cases. All of these cases fall within the overall commons framework of the atmosphere, but they are not all commons problems. The analysis would have been deepened by an assessment of the effect of the transboundary characteristics of air pollution on the evolution of that regime.

As Soroos considers the characteristics of the global commons, he focuses on two tragedy-averting strategies: voluntary restraint and regulatory regimes. He examines state actions that seem to contradict Hardin's position questioning the viability of voluntary restraint. But he suggests two explanations for these unilateral commitments: public pressure from citizenry and nongovernmental organizations and attempts to influence other states to act in a similar fashion. He emphasizes that voluntary restraint is not a dependable path for addressing transboundary or global environmental problems. International regulation, adopting features such as prohibitions, limits, operational rules, and economic disincentives, is the more effective option.

Over the last decade, the term "environmental security" has become an important part of environmental discourse. Soroos adds to this by providing a lucid discussion of the choices available to states as they seek to reduce environmental threats or vulnerability. A focus on threat leads to a preventive strategy, while a focus on vulnerability is likely to result in a defensive posture. States also have the option of acting unilaterally or collectively. This security scenario results in four strategic options: self-prevention, collective prevention, self-defense, collective defense. He uses the prisoner's dilemma to provide some insight into the strategic choices states make, applying it to each of the four cases. He warns of the danger inherent in states addressing environmental security in a fashion similar to the way they have addressed military security. The resulting strategy of self-defense would, indeed, lead to a tragedy of the commons.

The concluding chapter includes an intriguing discussion of the prospects for a comprehensive Law of the Atmosphere. Currently, there is no overarching law addressing issues such as jurisdiction over the atmosphere and users' rights. Unlike the oceans and outer space, the United Nations has not attempted to address the atmosphere in a comprehensive manner. Soroos explores the reasons for this and concludes that the current flexible, problem-specific approach has served the global community well. He argues that it was more important to focus on the development of regimes dealing with specific problems than to spend time developing a comprehensive legal regime for the atmosphere.

Soroos has provided a useful exploration of the issues relevant to the preservation of the atmosphere. This book is recommended reading for at least two reasons: The integrative examination of atmospheric degradation allows us a clearer understanding of the relevant challenges and policy responses, and the discussion of states' strategic options illuminates some of the factors that drive state responses to global environmental threats.

Political Realism in International Theory. By Roger D. Spegele. Cambridge: Cambridge University Press, 1996. 284p. \$59.95 cloth, \$19.95 paper.

Robert M. A. Crawford, *University of British Columbia*

It has become almost customary to apologize for approaching the problem of theory in international relations from a philosophical perspective. First among its many merits, Roger Spegele's *Political Realism* avoids this annoying and gratuitous practice. Spegele admits up front that his book is a second-order inquiry—an examination of “the examiners of the world rather than the world itself” (p. xiii). If this is enough to make some readers give it a pass, then the usefulness of Spegele's book will already have been confirmed, since an impatience for the “real business” of world politics discloses the preclusive but erroneous assumption that we already know how, and why, to study it.

In the genre of disciplinary thinkpieces to which Spegele's book stands refreshingly opposed, international relations (IR) is conceived as a monistic science for which there can be only “one correct methodological approach” (p. 88). That this quest for methodological and moral consensus has foundered says less about the actual state of IR than the failure of so many of its practitioners to recognize the patent absurdity of founding so manifestly a political subject on any sort of predefined consensus. As Spegele suggests, the surest way for a science to fail is to set standards it cannot possibly meet. But his rejection of the continued application of monistic scientific principles is also based on his view that they constitute only the most prominent of three inconclusive conceptions of IR. Spegele labels these “positivist-empiricism,” “critical/emancipatory,” and “evaluative political realism.” What he is able to offer, with considerable persuasion, is reasonable grounds to reject the adequacy of the first two approaches and reasonable grounds to accept a revised conception of “commonsense” realism as the only viable and appealing version of IR on offer. It is this defense of evaluative political realism that makes Spegele's book much more than just another antipositivist tract.

The book is divided into two parts, the first of which offers a “first cut” at evaluative political realism. It is focused mainly on identifying key elements of the positivist-empiricist and emancipatory approaches, with a view to exposing their inability to form any conception of international theory that we can use. Positivist-empiricism, Spegele argues, is just formalistic “speculation,” rather than a theory suited to our comprehension of “the life that we share with others in our human groupings” (p. 98). Critical/emancipatory theory, meanwhile, fails to recognize that all idealized versions of humanity are ultimately assimilationist, since the world is composed of human beings, societies, and nation-states, and these are always situated. It is in the latter half of the book that Spegele brings his argument for a revised version of traditional realism to fruition.

Spegele's enterprise reads like a bit of a theoretical reclamation project to the extent that he seeks to liberate the realism of E. H. Carr, Reinhold Niebuhr, Hans Morgenthau,

Martin Wight, Raymond Aron, and Herbert Butterfield (among inestimably many others) from the damaging clutches of neorealism or—as Spegele prefers to call it—“concessional realism.” By concessional Spegele means a version of realism that shares with “commonsense” realism its concern with sovereign states interacting as potential or actual adversaries, but concedes “the validity of the principal methodological claims of positivist-empiricism” (p. 15). The primary and paradoxical defect of concessional realism is that the very act of cementing its scientific credentials makes realism less real, in the sense that it precludes its ability to evaluate the human activities and practices that traditionally are its stock-in-trade. Spegele thus reaffirms the traditional realist idea of practice as ethical knowledge and the traditional understanding of theories as “conceptual capacities we can do things with” (p. 93). But in an important and perhaps understated sense, Spegele also needs to save commonsense realism from itself. Much of the seeming irrelevance of realism can be attributed to its aversion to any form of philosophy of science, a natural offshoot of its commitment to the irredeemable pluralism of interstate relations. This disinclination to philosophical self-analysis helps create the erroneous view that dramatic changes in world politics, and the seemingly waning fortunes of the state, must portend the diminishment of realism as well. Spegele's self-described objective, then, is to remind realists that theirs is a critical-reflective enterprise that understands the relationship of practice to theory not in terms of universal human interests and aspirations, but in terms that are always local. If this appears to point us toward relativism, it is only because we have failed to understand that theory can and must be a meaningful, critical device to evaluate and sort ends into better or worse, but it cannot do so in any way that is acceptable to all.

There is much to recommend this book, more perhaps than Spegele is disposed to presume. While he can hardly be blamed for not promising to make sense of the widening array of paradigms, positions, and discourses that sometimes pass for debate in the increasingly fragmented and tentative discipline of IR, the process of identifying rivals to his own favored conception of the subject does much to help us find our way about. To be sure, his discussion of many of the subtypes of positivist-empiricism and emancipatory theory are far from comprehensive, but this is not part of his overall purpose. What matters is that Spegele's ordering principles are useful, and persuasive, and his treatment of every perspective appropriately critical. Because Spegele has his own unambiguously favored conception of IR on offer, his balanced treatment of rival perspectives is all the more impressive, though he cannot resist the occasional acerbic dig. In one of the more interesting and original contributions in the book, Spegele is also able to find convincing support for evaluative political realism in the unlikely domain of Lyotardian postmodernism. Such is but one example of Spegele's admirable ability to make sense of international relations while resisting a truncated conception of where we can legitimately locate the subject, and to make a forcefully partisan argument for realism without collapsing into narrow dogma. Nevertheless, Spegele pulls no punches in his searching and telling critique of positivist-empiricism and emancipatory theory, and he seems to relish the prospect that his book will generate controversy.

On the whole this erudite and well-crafted study lives up to its advance billing as a coherent, viable, and attractive defense of realism. It also offers a timely middle way between the mutually unappealing extremes of rank rationalism and open-ended relativism that now appear to define the dis-

course. There are, however, problems with the book as well, the most notable of which pertains to how (or if) we are meant to situate it in the broader realist revival presently under way. Though Spegele's prime objective is explicitly revisionist, the seeming novelty of his position as an evaluative political realist threatens at times to obscure the sense of continuity and tradition that remains essential to his argument. As a result, Spegele leaves himself vulnerable to misunderstanding and invites us to wonder if he is trying to put a kinder gentler face on realist theory while shying away from its less palatable associations with *realpolitik*. It is worth noting, at least, that Spegele takes the moral high ground on more than one occasion in his condemnation of barbarities in the name of emancipation. He does admit, however, that—whatever its aspirations to achieve moral ends in particular contexts—evaluative political realism acknowledges the “possibility of moral and political tyranny” (p. 101). In the 1980s an English pop group called The Smiths titled one of its albums “Barbarism Begins at Home.” Is it possible that Spegele has something similar in mind? Despite an otherwise superbly crafted argument, he could do more to help us answer this question, or at least make sure that it does not arise.

Recasting the European Order: Security Architectures and Economic Cooperation. By James Sperling and Emil Kirchner. New York: St. Martin's Press, 1997. 287p. \$69.95 cloth, \$22.95 paper.

Carolyn Rhodes, *Utah State University*

Anyone wanting to understand the character of political-economic and security structures in post-Cold War Europe should read this book. It is a richly detailed, carefully written examination of existing cooperative arrangements in military security, trade, finance, and environmental affairs. Newcomers to the subject will find the treatment somewhat dense since the book goes into considerable detail about past and current experiences and assumes a certain level of previous understanding. Still, I would recommend it to students because of the strong historical foundation that is laid for each issue. Experts will find the book's approach very interesting and well considered, encountering a number of useful insights about the current state and future direction of European security. What the book does not do is attempt to advance any kind of overarching theoretical model, even though the authors embed their analysis in prominent existing literature.

This book is predicated on the assumption that in the post-Cold War period the evolution of the concept of security has outpaced the ability of existing architectures to adapt to its wider definition. That definition, the authors compellingly argue, must take into account economic security, which is shaped by trade, investment, and environmental relations and which requires very different policy approaches compared with narrower definitions of military security. The book's rationale seems to have been driven by the recognition that post-World War II structures—from NATO to the IMF—must be rationalized in both purpose and function to meet the demands of post-Cold War political-economic security concerns. At the heart of those demands is the effort to realize the peaceful transformation of the countries of Central and Eastern Europe (CEE). Therefore, underlying the authors' larger premise that European security architectures must be reconsidered is the view that “the stability of the post-Cold War European security order depends upon the successful societal transition of the former states of the

Warsaw Pact, namely the transition to the market economy and competitive multi-party democracies.” (pp. 202–3)

This emphasis upon the role of the CEE in the future of European security reveals how pivotal the region has become in defining where Western European interests lie and where Western European, U. S., and Russian interests overlap and diverge. Keeping this emphasis in mind, it would be misleading, however, to characterize the book as being driven solely by consideration of CEE futures. In fact, the book consists of a broader view of European security concerns that looks critically at the major institutional arrangements that currently exist in both the military realm of security and in the economic/environmental realm of security. Still, the use of the CEE situation to highlight interdependent concerns and institutional capabilities brings into relief how relevant the book's thesis is regarding broader definitions of security in the post-Cold War era.

The authors observe that post-Cold War circumstances have “diminished the force of anarchy . . . [and] enhanced the ‘interaction capacity’ of the European state system” (p. 16), which has created demands for new approaches to security and new opportunities for cooperation. As they systematically review and assess the major institutions designed to cope with these demands, however, it becomes clear that the myriad arrangements involved, including the major ones such as NATO, OSCE, EU, WEU, IMF, G-7, GATT/WTO, EBRD, and IAEA, all have limitations that have historical, constitutional, and budgetary origins. Furthermore, the authors make it clear that despite some success in international cooperation under these arrangements, individual states have tended to place domestic interests ahead of international cooperation. This is well illustrated in the macroeconomic policy arena, in which Germany and the United States often pursued monetary policies that worked at cross-purposes. It is evident as well in the military sphere; despite considerable lip service about cooperation, the United States wants burden sharing in NATO without having to forfeit decision-making supremacy, and EU member states profoundly disagree about the specific role that the WEU should have both within the EU and as the EU's defense pillar within NATO. While the authors recognize that the potential for future coordination is there, they observe that the desire for cooperation and unity of purpose remains thwarted by concerns over national sovereignty.

This may be especially problematic if the countries of Central and Eastern Europe are not successfully transformed into democratic market economies and integrated into Western cooperative structures. Making the point that the peaceful achievement of these goals is of vital concern to the economic, environmental, and military security of the West, the authors argue that such an outcome is not a foregone conclusion. Differences among the major players in the European Union, differences between the United States and European states, and reactions by Russia could all serve to thwart this goal. While the authors did not have the benefit of knowing about recent decisions regarding NATO enlargement or about the EU's Amsterdam Treaty, their assessment is still valid, and their words of caution remain relevant.

The Retreat of the State: The Diffusion of Power in the World Economy. By Susan Strange. Cambridge: Cambridge University Press, 1996. 218p. \$49.95 cloth, \$16.95 paper.

Stephen J. Kobrin, *University of Pennsylvania*

Susan Strange ends this provocative and thoughtful book with a reference to “Pinocchio's problem.” Not his nose

growing when he lied—a metaphor better left alone—but the lack of strings to guide him once he turned into a real boy. The diffusion of state power, and a more general systemic *entropy* of authority, has left us with “a ramshackle assembly of conflicting sources of authority” (p. 199). We all share Pinocchio’s problem: The strings that bound us unambiguously to state and nation have snapped, and we are left adrift in a world of multiple authorities, allegiances, loyalties, and identities.

Strange’s central argument is that the authority of all states is diminished as a result of changes in technology and finance and of the integration of national economies into a global world economy. In part, authority has shifted to non-state actors, most notably transnational corporations (TNCs). Yet, some authority in the system has been “lost” in the sense that it has shifted from states to impersonal markets; some of the fundamental responsibilities of the state are not being exercised by anyone. “The diffusion of authority away from national governments has left a yawning hole of nonauthority, ungovernance it might be called” (p. 14).

The state is not disappearing; Strange does not argue for the “end” of anything. She does argue forcibly (no surprise here!) that the state is in the midst of significant change—a “metamorphosis”—brought on by structural change in the world economy. It can no longer make exceptional claims; it is now one source of authority among several.

The Retreat of the State follows logically from *Rival States, Rival Firms* (1991), in which Strange and John Stopford argued that competition for global market shares has replaced competition for territory. Here, the shift in authority from states to markets is seen as “probably the biggest change in the international political economy to take place the last half of the twentieth century” (p. 43). At this point, “there is not much left of the territorial basis of authority” (p. 45). Territoriality is neither the sole source of political power and authority nor a critical factor determining the prosperity of national society.

In a sense, Strange is “taking the state back out.” While she only alludes to premodern political structures, she clearly looks both back (“once more and as in the past,” p. 73) to times when multiple authorities (e.g., church, emperor, prince, and lord) coexisted and when multiple political loyalties were the norm. She believes that international relations and other social sciences must transcend state centric theory and analysis: the “colonization” of the study of the study of politics by the state (p. 32).

Thus, power is “the ability of a person or group of persons to so affect outcomes that their preferences take precedence over the preferences of others” (p. 17). Power should be seen in terms of relationships—as a social process affecting outcomes—rather than in terms of resources or capabilities. One can then ask how and by whom values are allocated and decisions taken to affect outcomes. And Strange’s answer is—in large part—economic actors and impersonal markets.

TNCs, for example, are not “powers behind the throne” but “political institutions having political relations with civil society” (p. 44). As Strange sums the three major premises of the book, politics is no longer confined to politicians and officials; power is impersonally exercised by markets; and authority is legitimately exercised by authorities other than states. After developing her argument, Strange looks at five examples of “authority beyond the state”: telecoms, organized crime, insurance, the Big Six accounting firms, cartels, and international organizations. While the case studies are interesting, if somewhat superficial, they leave me with the old Scotch verdict of “not proven.”

The idea that the growth of markets can compromise state

authority is certainly not new; Charles Lindbloom (*Politics and Markets*, 1977) made the point in considerable detail twenty years ago. The question here is whether recent developments have transformed changes in degree into changes in kind: whether the shift of authority from states to markets, from governments to private actors, is marginal or systemic. Strange clearly believes the latter. What is new this time around is that all states are undergoing change in the same relatively short period. She notes that the last time this happened was the medieval to modern transition from feudal agriculture to capitalist industry. While I happen to agree, the question is whether the cases support the argument. Of that, I am not so sure.

There is no question that the global spread of enterprise, changes in technology, and American deregulation have resulted in major changes in the telecommunications industry: in pressure for privatization of PTTs, the opening of markets to competition, and the emergence of international groups of alliances. States have lost power over the sector.

There is no question that two functions critical to a capitalist economy are largely in private hands: insuring against risks and auditing accounts. I am not convinced, however, that the evidence presented here adds up to strong support for Strange’s arguments. These cases are not the best examples of structural change in the power and authority of states versus other actors in the system; of states being rendered as one among many alternative sources of authority.

Two minor quibbles with these cases may be noted. Political risk insurance did evolve from Lloyds coverage of ships at sea against hazards such as piracy. What happened in the 1930s, however, is that after Fascist bombing of Spain, Lloyds realized that land-based war risk could be serious, and it decided that neither the company nor anyone else would take them on. While the Big Six global accounting firms may have considerable power as a group, auditing has become a commodity as a result of digitalization, and there is fierce competition among them; their profits, “which might otherwise go to the shareholders” (p. 143), increasingly come from other sources.

Strange is on much more solid ground when she considers cartels and asks why this phenomenon has been virtually ignored by academics in the last quarter century. (While Paul Samuelson may have ignored cartels, I do suspect that he would be surprised to be placed on the political right.) The strongest potential argument here is not well developed, however. At this point, “cartels” are implicit rather than explicit; they reflect dense oligopolistic concentration resulting from dramatic increases in the cost, risk, and complexity of technology rather than an *ex ante* attempt to collude. The best example is commercial airframe manufacture, the world market for which will only support two huge players: Boeing and Airbus. Semiconductors and telecommunications are other sectors in which the number of viable players is limited by the size of a competitive R&D budget relative to the size of the world market.

The fact that in many of these sectors the scale of technology is mandating cross-national alliances among the largest players (e.g., IBM, Siemens, and Toshiba in semiconductors) exacerbates the problem. If size and concentration result from structural change, and the capabilities reside in transnational alliances, then power may really be shifting to actors beyond the reach of the territorial state.

One glaring omission is the absence of any discussion of the literature on transnational actors which has developed similar arguments—albeit in a very different context. Neither early efforts (i.e., Robert Keohane and Joseph S. Nye, Jr.,

eds., *Transnational Relations and World Politics*, 1971) nor more recent work on the emergence of global civil society are even cited.

I have one last qualm. While it may well reflect my own national bias—globalization only goes so far even for us believers—I think that Susan Strange has more than made the point by now that arguments about hegemonic decline are a mask for the incompetent use of American power and that international organizations tend to serve American interests. How about a truce?

The critical question is how the world economy—and the international political system—will cope with the diffusion of state authority; the spread of power to other actors; and more important, the vacuum that has arisen as the sum of authority gained by other actors is less than that lost by states. “How much disorder can the world market economy tolerate before it starts to unravel, wind down, fall apart” (p. 191)?

As Strange notes, international political economists are split between the “nothing has changed” and the “maybe a lot has changed” views of globalization. Given even a slight possibility that globalization entails a major systemic change in economic and political governance, however, it is irresponsible to ignore both the phenomenon and its consequences for our societies.

In this uneven but important book Strange raises a number of critical questions intelligently and provocatively. Reflecting her earlier life as a journalist, it is very well written and intellectually coherent. *The Retreat of the State* is rich in detailed argument and discussion and covers many more topics and subtopics than I can mention here. This book deserves a very wide readership among those interested in where the modern territorial state and the modern state system are headed as we enter the twenty-first century.

Democracy, Equality, and *Eidê*: A Radical View from Book 8 of Plato's *Republic*

ARLENE W. SAXONHOUSE *University of Michigan*

A Plato opposed to democracy fills the literature, and while some scholars question whether Plato adequately captures Socrates' possibly favorable views of democracy, Plato himself remains a paragon of elitism. I argue that Plato's response to democracy is far more theoretically interesting than simple disdain for the unenlightened masses. Rather, in Book 8 of the *Republic* he explores the fundamental tensions of a regime identified with freedom and equality, which he presents as characterized by formlessness, and the epistemological and theoretical problems posed by the absence of forms (*eidê*). *Eidê* give structure and identity to regimes and to their citizens; they are necessary for intellection and philosophy, but they are also the grounds for compulsion. Plato's analysis of democracy thus becomes a more serious challenge for democratic theorists than previously recognized.

An elitist Plato, opposed to democracy and hostile to the masses, fills the literature. In the midst of an extensive philological and grammatical commentary on Plato's *Republic*, James Adam (1902, 2.24, *ad loc.* 494a) includes the following brief but telling observation: "The theory of Ideas is not a democratic philosophy." He writes this in response to an interchange between Socrates and Adeimantus concerning the access of the many to the idea or form of the Good, during which Socrates claims: "It is impossible for the multitude to be philosophic." Only a few will have access to the forms (*eidê*).¹ A profound inequality of rule and authority seems to follow from that unequal access. I could begin with Adam's assertion that the theory of ideas is not a democratic philosophy, but the basis for my argument derives from a very different perspective, an epistemological one that has nothing to do with the capabilities, or lack thereof, of the many to attain a vision of the Good. Rather, I focus on the theory of the forms as a mechanism for categorization, opposing epistemologically, politically, and psychologically the openness of democracy. While Adam and numerous others see elitism in the Platonic theory of the forms because the many cannot ascend to a philosophic

vision,² I attend to the opposition between democracy and that theory to illustrate how Socrates' discussion in Book 8 of the *Republic* points to democracy's dependence on a "formlessness" that challenges claims of equality and of identity within democratic regimes.

The epistemological critique of democracy that derives from the theory of the forms points to very different challenges than those that motivated the judgment by Adam and others that the theory of the forms is not a democratic philosophy. For them, a hierarchy of intellectual skills justifies a hierarchy of political rule, and since the highest level of intellectual skill is required for an apprehension of the forms, a regime that distributes power equally to those who can ascend and those who cannot must fail. The parable of the boat from the beginning of Book 6, for example, captures this argument vividly. There, the somewhat deaf shipowner of limited vision who knows little about seafaring allows himself to be drugged by the quarrelsome sailors. Though they never learned the skill of navigation, they are eager to control the ship. Meanwhile, the true pilot is scorned as a useless "gazer at the heavens" (488a-489e). The discussion of democracy in Book 8 does not address that issue at all. Rather, it presents democracy as a regime that in its insistence on freedom and equality is a regime of formlessness, one that lacks *eidê*. The theory of forms insofar as it is explicated in Book 6 is in part the basis for our capacity to categorize—to recognize similarities and differences so that we can distinguish one person or object from another and recognize as well what unites them. On this rests the foundation of mathematics, our capacity to count, to add, to subtract, and our capacity to discriminate, to separate the good from the bad, the noble from the base, the citizen from the noncitizen.

Arlene W. Saxonhouse is Professor of Political Science, University of Michigan, Ann Arbor, MI 48109-1045.

The original version of this paper was written while I was a Fellow at the Center for Advanced Study in the Behavioral Science. I acknowledge with gratitude the support of the center's staff and of the Andrew W. Mellon Foundation, which helped fund my tenure there. Peter Euben, Jill Frank, Stephen Salkever, Jacqueline Stevens, and Judith Swanson offered helpful comments along the way. Thanks are due as well to the anonymous reviewers for this journal.

¹ *Eidê* (sing. *eidōs*) in the Homeric epics and later Greek literature often means simply that which is seen, the shape or form of something; it came also to mean "class" or "kind" of object. In the *Republic* and elsewhere in the Platonic corpus, the term refers to an immutable shape or form of a thing or value (e.g., Justice or the Good) that is accessible to the intellect only by abstracting from the senses and sensible particulars. In Book 6 (as discussed below) the form of the Good is the highest object of the philosophic soul's search, but *eidê* are more general than the limited repertory of value terms, such as the Good and the Beautiful. They help typologize (as in Book 8) and organize our sense experiences by rising above particulars subject to observation by the senses.

² Jowett and Campbell (1894, 3.281), for example, commenting on the same passage, reflect at length: "The opposition of the few and the many is almost as great in the reading age of the nineteenth century as in the hearing age of Socrates and Plato. In politics, in society, in the realms of thought and imagination, there are two classes . . . the inferior minds and the superior: those who are under the influence of the hour, and those who have character." They moderate these claims a bit by noting that the opposition "is not so entire and absolute as Plato seems to assume."

Democracy in its openness in Book 8 lacks this capacity for adding and for discriminating and thus lays out the tensions and dangers inherent in regimes founded on formlessness and on principles of equality. Claims of equality necessarily entail claims of inequality, of who is not equal. *Eidê* enable us to typologize, to define equal and unequal, but *eidê* also can tyrannize. The openness of democracy is the escape from that tyranny, but at the same time it may leave us lost without the grounds to make choices or structure the world in which we live. Thus, the epistemological critique of democracy in Book 8 points to the tensions underlying current debates concerning "identity" politics and the "politics of difference." In a contemporary world that cares deeply about equality, the formlessness at the heart of democratic principles creates profound contradictions about how to implement such claims. Likewise, contemporary demands that identity, a self-assertion of form, be acknowledged stand in tension with the openness of democratic "formlessness." The freedom we and Socrates in Book 8 associate with democratic regimes entails the rejection of tyrannizing *eidê*; but we cannot function either politically or intellectually without *eidê*. Socrates' examination of democracy as a regime of formlessness helps us understand the limits and contradictions of claims of equality and identity in democratic regimes—of an equality that effaces the *eidê* and of an identity that entails the assertion of *eidê*.

Book 8 traditionally stands as the book that traces the decline of regimes, but attention to that aspect has led scholars to ignore the equally strong focus that Plato places on typology, on the five forms (*eidê*) of regimes and their human counterparts.³ Socrates traces the movement from aristocracy to tyranny and the parallel personalities, how each one comes into being (the genetic analysis), but he also identifies the different *eidê* of political regime and how we can distinguish one from the other (the eidetic analysis). Among the *eidê* of regimes is Socrates' bizarre description of democracy, one that seems to have little to do with Athenian democracy as practiced in the fifth or fourth century B.C.⁴ or with the mechanisms of self-govern-

ment (the sharing of rule, isonomy, the assembly, the juries) that we may associate with the institutions of democracy past and present. Democracy is instead a regime of freedom and a radical equality arising from the absence of *eidê*, the very concept that controls the structure of Book 8. In Socrates' elaboration, this means that democracy, according to its fundamental principle of freedom, is the regime that is incapable of introducing typologies into the epistemological and political realm. The discussion in Book 8 thus subverts the book's apparent intention to give forms to regimes—as well as perhaps the philosophic explorations and claims of the previous books. A democracy true to its principles of equality and freedom must resist the tyrannizing of *eidê*, the boundaries and limits that define citizenship and the relations of parts. It must resist the typologies and forms that are part of a Platonic philosophical order. The conflict between philosophy and democracy is an epistemological one, not only a moral one.⁵

There often is a tendency among democratic theorists to avoid the theoretical complexity raised by typologies, that which asserts the need to search for differences at the same time as identifying similarities; such endeavors may foreclose addressing the more tractable aspects of democratic theory. Dahl (1986, 191), for example, prefaces a discussion of procedural democracy: "Since their origins in classical Greece, democratic ideas have been plagued by the problem of inclusion: what persons have a rightful claim to be included as citizens with full and equal rights to participate in governing the association. My strategy will be to leave this problem unsolved in order to set out the assumptions and criteria of procedural democracy." Charles Beitz (1989, 5) writes a magisterial volume on political equality, beginning with the exhortation: "For although nothing is to be gained by claiming that equality is not part of the definition of democracy, any philosophical theory of democracy that failed to take up the grounds of and content of political equality would be seriously deficient." Nevertheless, we hear little about the content of equality, and Beitz concludes by emphasizing the indeterminacy of his theory, avoiding the question of "who," though he thoroughly addresses the question of "how." A devotion to equality creates the difficulty of identifying the *eidôs* of the citizen for both.

Dahl and Beitz are just two of a notable and heroic heritage of modern democratic theorists who, while acknowledging the importance of asking what equality means and how it may be institutionalized, avoid addressing directly the complexities it poses for the very construction of a community that must assert inequalities by exclusion. Socrates in Book 8 addresses this problem directly by suggesting how equality is the most subversive of political goals, for it undermines the

³ The word *eidê* appears frequently throughout Book 8; a word for "decline" does not appear in the text. We read of change (*metaballei*, 545d), movement (*kinêthêtai*, 545d) and "mistaken (*hamartêmenas*) regimes" (544a). Yet, volume after volume on Plato records "the decline" but never the frequent appearance of *eidê*: Adam (1902, 2.195) refers to the "order of merit" of the regimes; Benardete (1989) entitles the subsection preceding the discussion of specific regimes "The Fall"; Jowett ([1897] 1962) entitles his chapter on this section "Successive Stages of Decline of Society and of the Soul"; Nettleship ([1901] 1962, 294) entitles his chapter "Successive Stages of Decline of Society and Soul," writes of democracy as a "lower form," and states that "a similar degradation is inevitable" (1901, 294, 299, cf. 300, 308). I am guilty also (Saxonhouse 1996, 90). See Annas (1981, 294).

⁴ Roberts (1995, 263–6) catalogs how Athens differs from the democracy in Book 8. See also Annas (1981, 300, 301). In contrast, according to Adam (1902, 2.234): "The materials for Plato's picture of democracy are of course taken from Athens more than any other single city. It is an extraordinarily vivid sketch . . . in spite of manifest exaggeration, [it] brings Athens nearer to us than almost any monument of ancient literature, Aristophanes alone excepted."

⁵ Concern with the moral failings of democracy appears earlier in the dialogue (e.g., 488a–489c, 492b–c, 493a–c) and in such dialogues as the *Gorgias*, the *Statesman*, and the *Laws*. A full discussion of Plato on democracy would require analyses of many other passages. For recent efforts see Euben 1994, Monoson 1994, and Saxonhouse 1996. Here I attend only to the epistemological issues.

potential definition of the city itself and of its inhabitants. After being established by violence, the democracy of Book 8 appears as a regime of gentleness and tolerance in this openness. Yet, despite its gentleness, inherent in it are the contradictions that lead to tyranny, the harshest of political forms, and to the violence of the tyrant himself. The key concept for understanding this transition from the gentle to the violent regime, I argue, is *eidê*, which in Book 6 were identified as necessary for the philosophic endeavor and which dominate the typologies of Book 8, but which are lost in the description of the democratic regime.

ΕΙΔÊ: BOOKS 6 AND 7 AS PRELUDE

To jump into a Platonic dialogue at midpoint is an interpretive crime; the dialogues are constructed to build upon themselves. Since the discussion of democracy in Book 8 comes after much of the dialogue has been completed, let me set the epistemological stage for my discussion. In Book 6 Socrates introduces the idea or the form of the Good to his interlocutors. Then there is a significant shift in focus in the discussions of democracy, which parallels the shift in focus in the treatments of poetry. In books 2 and 3 Socrates had sanitized the poetry of the Greeks with a view to the moral education of the young. After articulating the theory of the forms in Book 6, Socrates offers in Book 10 an epistemological critique of poetry and art as representation. Similarly, the earlier critique of democracy warns of the appeal of popular demagogues and the dangers of a democracy in which the assembly, loudly praising or blaming its leaders, educates the young. The assembly does not even appear in Book 8.⁶ With regard to both poetry and democracy, the theory of the forms refocuses the nature of the discussion.

Book 6 introduces the form of the Good; Book 7 explores the education necessary to bring philosophers into the sunlight of the Good.⁷ Socrates and Glaucon begin this investigation of the education of the philosophers with numbers and "this foolish thing . . . of knowing the one and the two and the three" (322c). This leads by nature, Socrates suggests, directly to reasoning, or, as he phrases it, calculation and number are "something that draw in every way toward being [*pros ousian*]" (523a). How can calculation move us in the direction of intellection and the perception of being itself, that realm in which the Good lies? It can because it entails the act of distinguishing and assembling. To count we must distinguish; we must see similarities and differences. We must recognize that apparent differ-

ences, what the eyes and other senses recognize, do not preclude construing seen objects as "the same." At the same time as recognizing that differences do not lead to an infinitely variable world, we must also avoid compressing all into one and thus overriding all differences. Once the soul with *noêsis* (mind, intelligence) enters, going beyond sight, we can distinguish (let us say) between the big finger and the little finger and yet also see their similarities; thus, we can add the little finger and the big finger to get two fingers:

We say that sight saw great and small not distinguished but mixed up together.

Yes.

For the sake of clarity, the *noêsis* was forced to see great and small not mixed up together but separated, just the opposite of sight (524c).

It is the capacity to distinguish one form from another and then to recognize what makes some similar to others that allows us to add and subtract, to count (see, e.g., Crombie, chapter 2 and 101–2). It is the *noêsis* and the ability to separate the parts from the whole—whether to add, subtract, divide, or multiply—that sets the mind on its way toward intellection, providing the mechanisms for comprehending the world we experience around us and for ascending to a vision of the Good.

Calculation is not the end of the process. Socrates takes Glaucon through a series of subjects that must be studied next in order to turn the soul toward the idea of the Good and that which is beyond sight, but we begin the process with the capacity to distinguish, to isolate differences and similarities, to recognize the *eidê*, from which we move on to the comprehension of the highest things. Democracy as portrayed in Book 8, however, is the regime in which we do not make that first step, in which access to the highest forms of knowledge is denied to us because of the inability (or unwillingness) to engage in distinctions, to impose the *eidê* on what we observe around us; democracy in its love of freedom precludes imposing *eidê* on what we see. The consequences are serious. The theory of the forms and the philosophic endeavor require categorization and the *eidê*, which democracy in its concern with freedom rejects.

In Book 6 Socrates articulated the image of the divided line to distinguish the philosopher from the sophist. Shortly before, Socrates had introduced the idea of the Good and used the analogy of the sun to help us understand the role of the Good. As the sun gives the light by which we see and the warmth by which we grow, so does the Good enable us to see and to grow. Though this idea of the Good, or the sun as the analogue of the Good, dominated the earlier discussion, in the image of the line, the idea of the Good appears to be above the line, outside—and perhaps even beyond—intellection.⁸ In the image of

⁶ This is especially surprising for contemporary readers, since much recent discussion of Athenian democracy has focused on popular participation. (Just to begin, see Hansen 1991 and Ober 1989, 1996.) This concern is entirely absent from Book 8.

⁷ As in the discussion of democracy, in this article I focus on the epistemological aspects, not the moral qualities, of the forms. For the latter, see especially 500d–501c, where the philosopher as painter turns to the forms of moderation (*sophrosunê*), justice, and popular virtue (*dêmotikês aretês*), using these divine patterns (*toi theiôi paradeigmati*) to fill in the city's blank slate (500d–6).

⁸ See Jowett and Campbell's diagram (1894, 3.313). Benardete's (1989, 176–7) rendering of the line includes both the sun and the Good, but outside the line, not as part of it. Bloom (1968, 464) draws a similar diagram but does not include the sun or the idea of the Good. See further Gadamer 1986 (28–32, and translator note 22).

the line, the object of *noêsis*, the highest level of intellectual endeavor, is not the idea of the Good. Rather, the objects of our *noêsis* are the *eidê*.

What are these *eidê* that give for many the epistemological, moral, and theological thrust to Plato's work? They are in fact little discussed in the *Republic*, and where they are discussed, the Greek is especially difficult. Yet, they remain at the center of the *Republic* and of Plato's epistemology. As Santas (1983, 233) notes: "A considerable body of literature has been built around the relevant passages. Yet, it is not hyperbole to say we have no satisfying or widely accepted answers to our questions."⁹ Here I want only to point to Socrates' insistence that *eidê* are necessary to add and subtract, to see what separates and what unites the indiscriminate world our senses perceive, and that it is our *noêsis*, through which we impose *eidê*, which enables us to comprehend the world around us. Or, as Santas (1983, 256) concludes about what it is that the form of the Good accomplishes: "[It] serves his metaphysics by bringing into relief the very ideality of the Forms, the eternal order and stability of the entities that must exist if this world is not be a 'vast sea of dissimilarity.'" The relevant passage is from Book 6, 507b, which Bloom (1968) translates as follows:

We both assert that there are . . . and distinguish in speech many fair things, many good things, and so on for each kind of thing. . . . And we also assert that there is the fair itself, a good itself, and so on for all the things that we then set down as many. Now, again, we refer them to one *idea*,¹⁰ each as though the *idea* were one, and address it as that which really is.

The thrust behind these confusing sentences seems to be that while there is the idea of the Good and of the Beautiful, there are also the *eidê* that unify the particulars into categories or shapes. Particulars (*pôlla*) are part of a class, and for us to recognize them as such we must be able to see what makes particulars similar and what distinguishes them from others. To compress the many into one, we must abstract from particular differences that can overwhelm the senses, from what makes the many many.

To clarify his argument, Socrates uses the example of geometers:

They make arguments for the sake of the square itself and the diagonal itself, not for the sake of the diagonal they draw, and likewise with the rest. These things that they mold and draw . . . they now use as images, seeking to see those things themselves, that one can see in no other way than with thought . . . this is the form I said was intelligible [*noêton men to eidos*] (510d–511a, Bloom 1968).

Glaucon wants Socrates to lead him beyond the forms, to the idea of the Good itself. Socrates resists. The forms are essential for our understanding and comprehension of the world we experience; beyond the

forms—toward the idea of the Good—we move beyond that which we need for a comprehension of this world to a theological unity and normative standard that may not be grounded directly in the experiences of our own lives. The forms that categorize and distinguish enable us to order what we experience and enable us to live in this world. The idea of the Good may take us beyond the foundations in this world.

REPUBLIC BOOK 8 AND DEMOCRACY

March and Olsen (1995) identify a series of issues that democracies must address. Among their criteria is:

Governance involves *developing identities* of citizens and groups in the political environment. Preferences, expectations, identities, and interests are not exogenous to political history. They are created and changed within that history. . . . It is the responsibility of democratic government to create and support civic institutions and processes that facilitate the construction, maintenance, and development of democratic identities (pp. 45–6).

Can democratic governments "facilitate the construction . . . of democratic identities" without raising questions about the fundamental principles on which they are built? This is the question Book 8 makes us confront.

Context

At the end of Book 7, after recommending the expulsion of all who are age ten or older and thus founding Callipolis "most quickly and easily" (514a),¹¹ Socrates concludes that he and his interlocutors have discovered the city and the man they sought. In the last phrase of Book 7, he states: "It seems to me that it is the end [*dokei moi telos echein*]" (541b). Book 8 begins anew, with Socrates summarizing the qualities of the city that is governed "most highly" by recalling the institutions agreed to in Book 5: the community (*koinas*) of women, the community (*koinous*) of children and their education, the common (*koina*) preparation for war, and rulers who are the best in philosophy and war. *Koinon* (that which is common) and its derivatives dominate this brief introductory paragraph (543a). Absent from this recapitulation is the inclusion of women among the rulers. That may be implicit in the reference to a "common education in war," but Socrates avoids explicit allusion to the comical and radical arguments that filled the first sections of Book 5 and gave that book its outrageous tone.

At the beginning of Book 5 Socrates desexualized the female to incorporate her into the public realm (Saxonhouse 1976). At the beginning of Book 8 he ignores that earlier effort; the sexual female, along with the distinction between the sexes, returns. The change in orientation appears immediately when Socrates curiously refers to what Bloom translates as "houses" (543b). The phrase is *katoikousin eis oikêseis* ("they live

⁹ Santas (1983, 257 n. 2) has a helpful bibliography for tracing the history of the debates surrounding these passages. See also Fine 1990, Irwin 1995 (chapter 16), Sallis 1986 (chapter 5), Teloh 1984 (chapter 3), White 1976 (section 3), and the multiple references in each.

¹⁰ Sallis (1986, 383) notes that Socrates uses the words *eidê* and *idea* synonymously.

¹¹ Callipolis is the community of wives and property, of potential women rulers, and of philosopher rulers that Socrates and his interlocutors founded in Book 5 and called the just city.

in homes”), and the word *oikêseis* (homes, residences, dwellings) is repeated in the next line of the text. The word never appears in Book 5; *oikêseis* are not only the buildings we associate with houses but also entail the notion of what is one’s own. The widely used root, *oikei*, means “of the same household” or “related by kinship.” In Callipolis, there are no kin and thus no *oikêseis*. Socrates, using the word in his redescription of Book 5, prepares us for the tensions that will explode in the transformation of Callipolis to the regime that loves honor (*philotimon*), which he chooses to call “timocracy” (545b): the deep split between male and female, between what is public and what is private, between an unmoving present and a world of motion. Socrates glided over these tensions by eliminating the private along with female in the construction of Callipolis, making ambiguous how the city might address the passage of time and leaving Glaucon to refer vaguely to “erotic necessities” (458d). The reference to *oikêseis* at the beginning of Book 8 suggests that distinctions between mine and thine may even exist in the “highest” city. As much as any errors in identifying the correct season for the begetting of children that result from miscalculating the nuptial number, these distinctions turn Callipolis into a timocracy.

Glaucon recalls the end of Book 4, when they had digressed from the flow of the argument, and comments on the parallels not between the city and the human being (*anthrôpos*), but between the city and the male (*anêr*) (543c–544b).¹² Glaucon, never completely comfortable with the conflation of the sexes, easily reverts to a world in which differences between male and female exist. No longer do we place male and female warriors and philosophers in the same class or *eidos*, looking to similarities rather than differences; now differences dominate, and separate identities mark male and female. Rather than aggregating into an undifferentiated unity by abstraction (Saxonhouse 1994, chapter 6), Socrates imposes differentiation, re-introducing sexuality, time, and misogyny.

Socrates informs us that change in regimes comes from faction among those who hold office. Faction entails differences. Callipolis was a factionless city. Individuals held nothing, not even bodies, in private: “Whenever anyone of us injures a finger, the entire community . . . senses it and all suffer together with the part that was injured” (462cd). Such a compressed, unified city is not fractured easily. Recalling Homer’s invocations, Socrates calls upon the Muses “to speak to us how first faction fell on them” (545d). Homer’s Muse spoke of human and divine passions; Socrates’ Muses focus on the divisions between the sexes and the difficulty of discovering the proper time for procreation. The complexity of the nuptial number continues to perplex scholars, but that complexity first arises because divisions within the city depend on acknowledging *eidê*, on categorizing male and female.

Mathematizing, as the education of philosophers in Book 7 had shown, entails the ability to distinguish.

Even to deal with the nuptial number, as the Muses do, is to acknowledge that we live in a world of similarities and differences—of *eidê*. Callipolis had tried to transcend the categories of male and female by which we compartmentalize humans, impose *eidê* on them, creating realms of public and of private at war with one another. The bodily need to reproduce—a need grounded in a nature that arises from the eidetic differences between male and female—required the “erotic necessities,” which the founders of Callipolis would just as well have done without (458d). As we shall see below, the democracy of Book 8 is most similar to Callipolis in this regard: both abstract from differences between the sexes, the former to create the regime of complete unity and commonality, the latter to create the regime of infinite variety and particularities.

In Book 8, Socrates identifies five regimes: aristocracy (Callipolis), timocracy, oligarchy, democracy, and tyranny. He then asserts there are *only* five, challenging Glaucon: “Or do you have some other idea of regime which appears in a distinct form [*en eidêi diaphanei tine*]” (544c)? Likewise for human types: “Then if there are five [*eidê*] of cities, there would also be five arrangements of the souls of individuals” (544e). Glaucon could easily have challenged Socrates. For sure, he knew Herodotus’ tale of the debate among the Persian conspirators about the virtues of three regimes (3.81–83); in the *Statesman*, Plato has the Eleatic Stranger identify six regimes. The *eidê* that Socrates proposes in Book 8 obviously do not exist by nature; yet, Socrates argues that they derive from nature in a more profound sense. With a quote from the *Odyssey*, Socrates draws us to the scene where Penelope questions Odysseus, disguised as a stranger and stripped of any identity. She asks: “From where are you? For you are not sprung from an oak of ancient story nor from stone” (19.162–63). Socrates, in turn, asks Glaucon: “Or do you think out of oak and stone emerge regimes rather than from the character of the people in the cities” (544d)? Humans are not born from the froth of the sea, and, contrary to Athenian autochthony myths, citizens do not spring forth from the earth. The regime, in this telling, grows naturally from the inhabitants of a place and takes on the form of those living there. Glaucon listens appreciatively, raising no objections, allowing Socrates to map a limited number of human types onto regimes (544e).

Book 8 begins with the assertion of the *eidê* of human character, of political regimes, and thus of the importance of categorization. Were it not so late in the evening, Glaucon or one of the others still awake might have had the energy to question the proposed typology. As it is, they let Socrates proceed with his five *eidê*. Epistemologically, as we learned in the earlier books, we need *eidê* to understand what it means to add, to subtract, to use our intellects, to set our perceived world into some sort of order. Politically, though, what is the legacy of these categories of regimes? To analyze we need to have *eidê* of individuals and of regimes, but do they become Procrustean beds, originating not in nature but merely in Socrates’ fantasies that they are

¹² *Anêr* appears three times in 543d–544a. Socrates continues to discuss the *anthrôpos* (544d).

based on a limited number of human types? Democracy and the democratic man provide the antidote to the argument from the beginning of Book 8; they deny the categorizing and summarizing role of the *eidê* and instead allow variety to flourish. But does the freedom from *eidê* and consequent equality mean that democracy allows monsters to be born? Or does true freedom require the absence of *eidê*?

Book 8 begins by forgetting the effacement of the differences between the male and female that initiated the radical proposals of Book 5. As Socrates addresses the difficulty of deriving the correct nuptial number, he ignores this earlier effacement and worries instead about reproduction and the mingling of the two distinct sexes. Therewith, a latent misogyny surfaces. In Book 5 Socrates dismissed any natural inferiority of female to male; in Book 8 imposing *eidê* on male and female establishes classes and hierarchies that appear prominently when Socrates describes the rise of a timocracy. Miscalculation of the proper nuptial number results in the lawless mixing of iron, silver, and gold (547a), but the emergence of the timocratic man is more dramatic than this obscure lawless mixing suggests. A nagging wife and mother, the *eidos* of the female such as would appear in an Aristophanic comedy, gives rise to the timocrat. He hears his mother express anger that her husband (*ho anêr*) is not a ruler, does not seek wealth or engage in civil suits. He is not ambitious, she complains; he is "unmanly" (*anandros*) (549c–e). Adimantus, never one to speak positively about women, wholeheartedly agrees: Many such things belong to women. With the reintroduction of the *eidê* of male and female, with the reenforcement of the differences between them, there is the identification of particular qualities associated with each, and the term "unmanly" becomes a derogatory epithet. In Callipolis, the conflation of male and female precluded such language.

Timocracy, itself arising from the reintroduction of sexual difference, in turn becomes oligarchy, since once there are private treasure houses, the desire for private accumulation replaces the desire for honor.¹³ The rise of oligarchy exacerbates distinctions between groups within the city; oligarchy is a city torn within itself, divided into two factions, lacking the cohesion of Callipolis, on the one hand, and the openness and freedom from compulsion that we find in democracy, on the other. The concentration of wealth and the creation of a class of those without money leads to beggars, thieves, purse-snatchers, and craftsmen of all sorts of evils. The portrait of the oligarchic city is one of misery and division; the accumulation of wealth for the few means the absence of any cultivation of moderation among the rulers or among the poor. Licentiousness follows for the wealthy, hatreds and plotting for the poor (555d). The move to democracy is no

"decline." It is a blessing, with the extremes of poverty and the evils associated with oligarchy left behind and the divisions between rich and poor surmounted. To achieve this, though, there must be the violent overthrow of the oligarchic regime. The strong poor, desirous of new things (*neôterismou erôntes*, 555de), kill and exile the lazy, fat men of wealth (555d–556a). After the violence of the transition to democracy, we arrive at a regime of softness and gentleness, no longer plagued by factions and without compulsion—though its gentle formlessness begins in the violent expulsion of the wealthy and ends in the violence of the tyrant.

Democracy

Dēmokratia then comes into being whenever the poor, not weakened by the overindulgence and the laziness of the rich, are victorious (557a), killing and exiling the "resourceless" (556d) rich. Socrates takes us briefly to the institutions of democracy: "They [the inhabitants of a democratic regime] partake of the regime and the offices from an equality [*ex isou*], and for the most part the offices in it are by lot (557a)." This is all he says about the institutions of a democracy. He quickly turns to the question that will control the rest of the discussion of democracy: What sort of regime is this (557b)? The way of life, its culture, dominates; we hear no more about offices or the lot, much less assemblies or juries. The defining characteristic of democracy, Socrates tells us, is freedom. "The city is full of freedom [*eleutherias*]," freedom of speech, *parrhêsia*, the opportunity (*exousia*) to do in the city whatever one wishes; in a democracy, Socrates reiterates, each one will arrange his private life (*idian*) as he pleases (557b).

From the central theme of Callipolis, the *koinon*, the sharing of friends, property, and family, we move to a privatized world. The democratic regime exalts the *idion*, that which separates, makes us distinct from others; and the democracy of Book 8 has the openness to incorporate all those distinctions, to allow for what is our own, and not to demand the sharing of qualities, place, friends. Democracy here is the private regime in which we act as individuals, not as parts of a common enterprise. This "idiocy"¹⁴ does not bring faction to democracy; it leads rather to an egalitarian gentleness that imposes neither *eidê* nor hierarchy. Differences do not matter, as "each arranges his [her] private thing [*idian*]" (557b). This regime's emphasis on particularity results in a vast variety of human types (*anthrôpoi*, 557c). This appears in contrast to the earlier claim that there were only five human types. We experience democracy's multiplicity without sorting or categorizing, defying any theoretical model that can distinguish and then unify multiplicity into *eidê*. Democracy as it appears here is pre- (or post-) eidetic, allowing for a wide array of visual and sensual experiences.

In the passages on the freedom of democracy,

¹³ In this discussion of oligarchy, Socrates (and/or Plato) in no way defends the rich against the poor. Reservations about democracy in Book 8 come not from hostility to the poor or worries about the unskilled having political power. Rather, the portrait of the wealthy is devastating. The Woods (1978) claim that Plato associates poverty and engagement in banausic trades with the lack of moral character. The opposite is true here.

¹⁴ I use "idiocy" in the sense that derives from *idion*, that which is private and distinctive, that which separates an individual, a family, a species from another, that which does not attend to the public. See further Saxonhouse 1983.

Socrates repeats forms of the word *poikilos* four times (557c) and claims that this “multihued” quality makes the many judge democracy the most beautiful (*kalliston*). In Callipolis, the beautiful city by name, there is the uniformity, stability, and oneness of the human *eidos*; in the city which is most beautiful to the many, there is no categorization, no effort to move beyond the particular to identify what unifies. The particular is accepted in its uniqueness, not as a tool to extend beyond itself or to become a part of the larger whole. Consequently, democracy provides the setting in which Socrates can imagine a multiplicity of regimes, including, of course, Callipolis.

Democracy, dismissing the unifying *eidê*, means that nothing and no one is imprisoned in a form. Socrates extends this even to the level of language; in a Thucydidean twist, words unconstrained by definitions take on multiple meanings. Describing the transformation of the youth into the democratic man, Socrates speaks as if he were quoting Thucydides on the Corcyrean revolution (Adam 1902, 2.243). Moderation is called cowardice; arrogance, good education; anarchy, freedom; wastefulness, generosity; and shamelessness, courage (560d–e). The malleability of words matches the fluidity of a democracy; unrestrained by *eidê*, words like people are free, unbounded by history, tradition, or past usage. In Thucydides, the openness of language is the basis for civil strife; in Socrates’ democracy it is merely one example of the absence of compulsion. Neither individuals nor words are forced into *eidê*. In Callipolis, the regime of necessity, there was no uncertainty about form; that uncertainty becomes the underlying principle of democracy.

Words are but one example of this formlessness. Socrates offers many other illustrations of this extreme freedom (563b). In democratic regimes, slaves do not differ from citizens. “Men who are bought and women who are bought are no less free than those who bought them” (563d). Slavery, categorizing humans and setting them into hierarchical relationships, is meaningless in a society which sets no common boundaries between individuals, which has no *eidê* by which we classify individuals. This formlessness extends as well to the freedom of women toward men, of men toward women, leading to the complete promiscuity of the sexes. The parallel to the mingling of the sexes practicing gymnastics in the palaestra in Callipolis is striking, but the similarity derives from opposite impulses. In Callipolis, a unifying *eidos* abstracts from the particular differences of the sexes, focusing on what is shared rather than what differentiates; in democracy, the mingling comes from the absence of *eidê* that might give the male or female sex any form or meaning. In each case, no hierarchy exists because each regime considers sex as irrelevant, one by unifying male and female into one *eidos*, the other by allowing for an infinite multiplicity of forms.

As with slaves and their masters, as with male and female, so, too, even with animals in a democracy. Animals are freer in a democracy than in any other regime. Anyone who had not experienced it would not believe how much freedom they have. Thus, “female

dogs according to the proverb become of the same sort as their mistresses and also the horses and asses are accustomed to journeying freely on the roads, hitting whoever stands in their way if they do not stand aside, and thus all the rest is full of freedom” (563cd).¹⁵ Animals, having equal access to the streets of Athens, unself-consciously bump into humans. Meanwhile, men condemned to death or exile do not take on the form of “condemned men”; they dwell in the midst of the city. Like the animals, they wander the city unremarked upon (558a).

Freedom, in the problematic meaning that it acquires during Socrates’ discussion, entails the failure to distinguish one form from another, to give form to the slave as opposed to the master, to the female as distinct from the male, to the dog as distinct from the human, to the condemned man as distinct from the innocent citizen. This fluidity and malleability, this absence of *eidê*, attractive in its abstraction from the compulsion that marked Callipolis, nevertheless creates an underlying unease as Socrates clarifies the dangers inherent in this formlessness.

From Gentleness to Compulsion

Democracy as a forgetfulness of form extends to the inability to distinguish between good and bad pleasures—to the toleration of all. In Socrates’ democracy, freedom is not being forced into a shape. Democracy thus entails a rejection of the very principle that dominated the *Republic* since Book 2, when the first steps were taken toward founding the just city: Each individual is suited for one task, Socrates told us there. Such a principle is meaningless in a multifarious democratic regime, where all do many things, where no one retains a single form that lasts over time.¹⁶ The politics of the first city of the *Republic*, Glaucon’s so-called city of pigs (372d) and its extensions throughout the dialogue, depend on the principle that each person performs one task, everyone having a prescribed *eidos* that sets him or her into a category. Once the individual is properly identified according to his or her nature, there is no fluidity; the house builder remains the house builder and does not become the shoemaker. This then becomes the definition of justice in Book 4: “Each one must practice that one thing about the city, the one for which his nature has made him naturally most suited” (433a).

Earlier in the *Republic* the forms gave political—and

¹⁵ Jowett and Campbell (1894, 3.398) write: “Cicero cites, but can’t carry over the jest. The most extravagant and comical ideas . . . often occur in the works of Plato. But the manner of saying them . . . does away with the feeling of bad taste and impropriety.” We need to read these passages as more than comical. They are integral to Plato’s presentation of the fundamental assumptions about democratic principles.

¹⁶ Here we see recollections of Athenian democracy, in which citizenship entailed taking on many forms, from juror to ecclesiast to hoplite to port inspector. See also footnote 4. Annas (1981, 300) misconstrues Athenian democracy when she responds to the tolerance theme of this section by commenting: “What Plato presents as the tolerant indifference of democracy could not be further from the state of affairs in Athens.”

epistemological—order. Any blurring of *eidê*, by someone not doing his or her own thing, would erode the potential for justice of the city; yet, just as the just city is built on an adherence to form and the exploitation of form for the structure of society, so democracy, as the regime that rejects forms, is in Socrates' words an "anarchy" (562e). Lest that word take on contemporary connotations of violence, anarchy here means simply being without rule, which leads to a profound gentleness. In this soft regime where compulsion is banished, where forms do not tyrannize, all do as they wish. The parable of the cave in Book 7, which tells of dragging one with the potential to be a philosopher out of the cave and then forcing him back down, makes us harshly aware of the compulsion of Callipolis. About democracy in Book 8, Socrates states: "There is no compulsion to rule in this city, even if you are competent to rule, nor to be ruled, if you do not wish to, nor to war when the city is at war" (557e).

The lack of distinction between male and female, animals and humans, condemned men and innocent citizens makes clear that the forgetting of form, and the absence of compulsion attending it, also means the absence of hierarchy. With the blurring of form, criteria for authority dissolve, claims to rule retreat. As Socrates begins to identify the negative aspects of democracy deriving from the absence of *eidê*, he offers as examples how in a democracy the teacher fears and fawns on the students (563a); how the young show no deference to the old; how there is no difference between the ruler and the ruled, whether in public or in private (562d); how the father habituates himself to his son; how the city dweller fears the metic, the foreigner without rights living in this city (562e); how the old and the young converge and compete (563a); and how there is no distinction between strangers and citizens (563a)—calling into question the very structure of a polis that cannot identify its own citizens. Everything (one) blends into the other. We can no more tell moderation from cowardice than we can tell a father from a son, a teacher from a student, or a citizen from a noncitizen.

In contemporary understandings, the absence of hierarchy translates into equality, but that is too simple a translation for what occurs in the *Republic*; equality entails the identification of those who are equal, an apprehension of the forms that unite and separate. The democracy of Book 8 gives us such a radical view of equality that there is no foundation for recognizing those who are equal or unequal, which in turn would lead to a hierarchy—whether of male over female, humans over animals, or Greeks over barbarians. Likewise, an Aristotelian theory of distributive justice, of equals to equals and unequals to unequals, cannot survive Book 8's radical equality or the formlessness of a democratic regime that, according to its principles of freedom, refuses to impose forms.

The same fluidity, absence of compulsion, and abstraction from hierarchy characterize the soul of the democratic man, "of such a sort in private [*ho toioutos idiai*]" (558c). The transformation of the oligarch's son into the democratic man begins with the unacknowl-

edged opposition between freedom and necessity (561a). There is at first the freeing of all desires, necessary and unnecessary, the submission to all, scorning neither the necessary nor the unnecessary and nourishing each equally. The democratic man, like the democratic regime, lacking the compulsive categories of *eidê*, is unable to distinguish, to place any desire in a box with a label telling him whether to use or repress it or to set it in a hierarchical relation. "If someone says there are good and bad pleasures, he throws his head back and says all are alike and must be honored equally" (561c). There is no order in his life, but he calls his life "sweet, free, and blessed" (561d). Without necessity, he can live multiple lives. Like the city filled with many *paradeigmata* of individuals, he is filled with a multiplicity of life styles:

He lives his life having set pleasures into an equality [*eis ison*]. To the chance passion he hands over rule of himself until he is full and then to another, scorning none but nourishing all from an equality [*ex isou*]. . . . He lives each day welcoming the desire that falls on him, at one time getting drunk and playing the flute, at another drinking only water and restraining himself, then doing gymnastics and again being idle and careless of everything, and then spending time as if he were philosophizing. Often he is active in the city's affairs and jumping he says and does what he chances on (561bd).

The list goes on and on.

The democratic man who does not recognize some pleasures as equal in their necessity and others as unequal in that they are unnecessary has in his soul "the most characters [*êthôn*], and is beautiful and many-colored [*poikilon*]" (561e). He possesses within the soul the radical equality of the democratic regime of complete freedom. His soul, like the city he reflects, is anarchic. Anarchy etymologically means not only "without rule" but also "without *archê*," without beginning or foundation. There is no primary resting place. The city and the individual float without origins or direction defined by a moment of creation. A nature controlling, limiting what one does, is absent. Both the democratic man and democracy exhibit the fluidity and flexibility of form that opposes the fundamental principles of the philosophy and politics articulated in the previous books.¹⁷

The portrait of the democratic man suggests a maniacal experimentation with various lives and a loss of the gentleness of the democratic regime. In all the references in this section to the beauty and gentleness of this multiplicity, to the genial—almost comic—democracy, there is nevertheless the threatening undercurrent of the violence of a life without *eidê*, whether public or private, a life without categories. This disturbing undercurrent surfaces when Socrates and Adeimantus, quoting from Aeschylus, recognize that dwellers in a democracy say whatever comes to their lips. Perhaps this is an allusion to Athenian *parrhêsia* (freedom of speech) but also, given the

¹⁷ Wolin (1994, 49–50) captures briefly the point I am making here when he discusses the limitations that constitutionalism imposes when it assigns form and "reconstitutes politics as identity." To underscore his point, he turns to the democracy of Book 8.

reference, to blasphemy. If the inhabitants of a democracy have no worries about blasphemy, are there no gods who care about what they say? Are the citizens irrelevant to the gods? Or the gods to the citizens? For the Greeks, the gods would not control a world in which men say freely whatever comes to their lips. No punishments come from the gods. No image of a bloodied Oedipus or an Antigone hanging in a cave outside the city need disturb their sleep.

Socrates tells us that democratic citizens pay no attention to law (563d), written or unwritten, so that no one can be their despot. Yet, again, behind this delicious freedom remains the ancient readers' recognition of the divine source of the unwritten laws and the tragic consequences of blurring the boundaries between human and divine. Antigone's famous speech about the unwritten laws of Zeus reminds us of those decrees that come from the gods and not from humans. The gentle regime of tolerant men and women who abstract from *eidê* is so gentle that it is profoundly impious and inattentive to the laws of the gods, just as it is inattentive to the judgments of execution or exile by its own citizens. In this softness, however, democracy lays the groundwork for the severest forms of violence.

As boundaries between gods, humans, and animals dissolve, or are never even recognized, freedom becomes slavery, and the epistemological denial of *eidê* finds expression in regimes of severe rather than gentle consequences. The transformation of democracy into a tyranny and the democratic soul into the tyrannical soul, so powerfully depicted in all its depravity in Book 9, is a sad tale. According to Socrates, the cause is a certain greediness for what democracy has defined as a good: freedom and, as we understand now, freedom as the destruction of *eidê*. But the image that captures most profoundly the end of democracy comes at 565d and the mythos of the temple of Lykaian Zeus in Arcadia. Socrates relates the story:

What is the beginning of the change from a leader into a tyrant? Or is it clear that when the leader begins to do the same thing as in the myth which is spoken about the temple of the Lykaian Zeus in Arcadia . . . how the man tasting human organs cut up with organs of other sacrificial animals necessarily becomes a wolf (565de).

The leader who becomes the tyrant "tastes the slaughter of kin with unholy tongue and mouth" (565e), and if he is not killed, he becomes a tyrant, and he changes into "a wolf from a human being [*anthrôpou*]" (566a).

Democracy ends with a story of human sacrifice and cannibalism. The democratic regime, in which one says whatever comes to one's lips, in which a radical equality means no hierarchy, in which animals are treated no differently from humans, and in which humans see themselves as not needing or as no different from gods, ends with the impious and repugnant cannibalism to which such blurring of boundaries leads. Tyranny takes over the principles that marked democracy and shows the darkness to which a regime that ignores *eidê* leads once the violence of the passions takes over. The tyrant does not distinguish between being human and being a

wolf, just as democracy does not distinguish between the human being, the ass, and the horse.¹⁸

Socrates concludes Book 8 by telling how the tyrant gains power. In a reference to themes from the early passages of the dialogue, we learn that the tyrant does not know how to distinguish friends from enemies. Such categories appeared vivid to Polemarchus when he was first challenged to define justice; they were questioned as Socrates explored our capacity to recognize friend and enemy, our need for a sharper and more profound ability to make those distinctions. The tyrant, the final expression of the democratic man, is the full expression of this incapacity to distinguish. He must (*dei*) do away with those who speak honestly to him about what is happening (those who are his friends) if he intends to rule; no one of any worth among his friends and foes remains (567b). Tyranny likewise is purged of both friend and foe, so the Polemarchian problem that set the interlocutors forth to find justice and injustice disappears, just as in a democracy, according to the principles of Book 8, the Polemarchian problem—and with it the impulse to philosophize—disappears, not by a purging but by its irrelevance.¹⁹

CONCLUSION: *EIDÊ* AND DEMOCRATIC FREEDOM

In the traditional story of the gigantomachy between ancients and moderns, theories of equality and inequality have divided the two camps. It is argued that the ancients—Plato, Aristotle, Cicero—offer a hierarchical world view in which political regimes succeed insofar as the order they impose matches the natural hierarchy of talents, whether they be those of the philosopher rulers of the *Republic*, the freemen of Aristotle, or the well-born of *De Officiis*. In contrast, from (let us say) Machiavelli onward, the hierarchy based on some natural criterion of worth breaks down. The chain of being which controlled much of medieval thought shattered under the bold assertions of Machiavelli, who urged men to imitate beasts, women to imitate men, and men, in order to outwit Fortuna, to imitate fickle

¹⁸ The tyrant in Book 9 continues the theme of formlessness, not recognizing the difference between waking and sleeping (571cd), gods and humans (573c); he is himself like a woman (579b). The description of the tyrant illustrates the true tragedies that arise when the failure to distinguish is combined with eros and with political power. On the close connection between the tyrannical man and the democratic man, note the use of *poikilos* in the description of the parts of the soul at the end of Book 9 (588c).

¹⁹ Benardete (1989, 200) analogizes between the democracy of Book 8 and philosophy, arguing: "Democracy's failure to enforce its decisions and protect itself parodies philosophy, for which everything is open to revision." (Cf. Barber 1996, Euben 1996, Monoson 1994.) This is too strong. Philosophy as the exercise of the intellect pursues *eidê*. Democratic freedom and equality entail the dismissal of *eidê* and thus create tensions with the philosophic endeavor. This does not mean that philosophy necessarily accepts the *eidê* any political regime imposes. In Book 2 Polemarchus thought he knew who was friend and who was foe. Socrates shows that the *eidê* Polemarchus established were not adequate. Philosophy is willing to question the constructed *eidê*; the democracy of Book 8 dismisses them. Insofar as philosophy seeks *eidê*, it remains an activity of compulsion—dividing and uniting—rather than one of freedom.

women. The heroes of Machiavelli's story transform themselves from subjects to rulers, from advisers to princes, and break through what appeared to be natural distinctions. The flux of nature denies any determination of who or what men and women will be. Machiavelli gives us a world of fluidity, in which forms are not given by nature, to be discovered by the intellect and put into place in the political structure. Forms are the result of human assertion and efforts applied in opposition to a formless nature (Pocock 1975, chapter 6 and 169).

The above discussion suggests that, at least insofar as Plato is concerned, the story of the gigantomachy, with the ancients at swords with the moderns over issues of equality and the fluidity of nature, is far too simple a tale. Plato does not merely favor hierarchy and reject equality as a political principle; he does not merely assert the pre-existence of *eidê* waiting to be forcefully stamped on individuals to set them into an ordered world.²⁰ Instead, inquiring into the principles of a democracy, he explores the premises of a fluid nature, of a world without *eidê*. Machiavelli, offering a new world view of a fluid nature, challenges medieval thought and prepares the foundation for the modern world's claims of equality, whereby no individual so differs from another that s/he can claim authority over others. Plato's Socrates in Book 8, like Machiavelli, offers a view of a natural world of flux without any fixed point, lacking beginning and form. Precisely because the early modern theorists did not follow through on the theoretical principles behind the rejection of *eidê* in the embrace of equality, as did Socrates in Book 8, they did not address the difficulty of justifying the imposition of *eidê* in a world of flux; they did not confront the problem of identifying the *eidê* of those who were supposedly equal. History has shown and continues to show the indeterminacy of equality in a Machiavellian world of flux.²¹ It has been a truism almost since the birth of liberal theory that freedom and equality are at odds. The democracy of Book 8 suggests not that they are incompatible, but that the mistake is the failure to recognize that true equality can only come from the freedom from tyrannizing *eidê*. Plato forces us to see the deepest consequences of our casually held principles.

While the democracy of Book 8 gives us a threatening portrait of the city without *eidê*, at first there is something very appealing about the multihued regime that transcends categories to include all—women, slaves, horses. Socrates uses the word *kalos*, beautiful (three times in 557c), to describe this regime. Though it is easy to dismiss this as ironic, perhaps our prejudices about the *Republic* as extolling the city of Book 5

and our insistence on describing Book 8 as the story of regimes "in decline" make us assume irony here. We lose the richness of Plato's work and let ourselves be drawn into worn-out models of "the ancients versus the moderns" if we see the democratic regime in Book 8 as simply a decline on the way to tyranny. Socrates has other criticisms of democracy. By Book 8, he turns away from familiar critiques about democratic assemblies and identifies the epistemological problem democracy introduces, namely, that a radical equality may entail the incapacity to assess who rules, to decide who—metic, slave, woman, Cyclops, horse—is inside and who is outside the city. And Book 8 may ultimately reveal how that incapacity to impose forms, whether they be by nature or not, leads to the cannibalism of the temple of the Lykaian Zeus, setting the stage for the violence of the tyrant. Taking more seriously this section of the *Republic* than has been done previously points to the political role of the epistemology of the *Republic*'s central books. Plato's concerns about democracy do not come only from an animus toward the regime that executed Socrates; they arise because of the problematic forgetting of *eidê* that is central to the freedom of the democratic regime. The investigation of *eidê* in the democracy of Book 8 forces us to face an inherent tension in all democratic regimes.

March and Olsen (1995, 46), as noted above, ask that democratic governments "create and support . . . [the] development of democratic identities." They reflect the current sensitivity to the value placed on individual and communal identities. What else is "identity" but the imposing of an *eidos* on the self or others? Socrates' portrayal of democracy in Book 8 questions whether democratic governments committed to freedom and the radical equality that is the true companion of that freedom can help create those identities without working against their own fundamental principles and without becoming tyrannical. To develop identities is to impose *eidê*. The freedom of democracy is the rejection of restrictive *eidê* which lead to exclusion and hierarchy. Yet, to live without political and epistemological *eidê* is to create the conditions in which gentleness may be readily transformed into violence, in which thought becomes a disordered melange, in which words have no history, and in which the soul begins an inevitable journey to tyranny.

Book 8 presents the epistemological and psychological challenges to claims that democratic governments should enable the construction of identities. The issue Socrates poses is not whether regimes should or should not do so, but rather that the underlying openness at the heart of democratic principles defies *eidê*, makes such demands contradictory, and points to the potentially tragic incompatibility of such choices. Without addressing directly the need for, as well as the dangers of, *eidê*, we ignore the inherent theoretical contradiction in the democratic regimes we inhabit. To address them effectively, we must understand the challenge Plato posed almost 2,500 years ago to the readers of his dialogues. Most basically, there is the question of whether the very identification of citizens and noncitizens violates the principles on which democracies have

²⁰ The myth (*pseudos*) of the metals from Book 3 may seem to undermine my claims here, but that passage remains ambiguous. It need not be read as a defense of *natural* human inequality. It is a view of human inequality required by the politics of Callipolis, for which Socrates invents it.

²¹ See Thomas (1983) for a discussion of this problem in early modern England, as it struggled with how to differentiate humans from animals and then how to justify distinctions among humans, male and female, black and white.

been founded. One longs for a Platonic theory of statecraft that would lead us out of these contradictions, but Socrates does not offer such a solution. As always, he leaves us in a state of *aporia*, pointing to the depth of the issues and the complexities of any solution to the problem that even the best contemporary thinkers glibly set aside. We cannot expect democratic political regimes to help develop identities until we resolve the incompatibilities Socrates, by confronting radical equality head on, has shown between identity and democratic freedom, between the tyranny of the *eidê* and our need for them.

The Illusion of Power and the Disruption of Moral Norms: Thucydides' Critique of Periclean Policy

S. SARA MONOSON and MICHAEL LORIAUX *Northwestern University*

Scholars in both international relations and political theory have been turning their attention to Thucydides with increasing frequency but with dissimilar questions. We draw on both traditions of inquiry to reexamine Thucydides' view of Pericles. We argue that antithetical reasoning is present in the treatment of Pericles and is manifested in the opposition between the statesman's brilliance and the infelicitous consequences of his statecraft, as become evident in the work as a whole. This antithesis undermines the claim advanced by certain figures in the History, as well as by contemporary realists, that states (statesmen) should not be held to the same moral standards as individuals because to do so subverts their capacity to conduct prudent policy. We propose that Thucydides' work suggests, instead, that it is precisely when the norms of moral conduct are disrupted that states and individuals find it next to impossible to chart a prudent course of action.

Stanley Kubrick's *2001: A Space Odyssey* is punctuated by the incongruous appearance of a tall, polished metal shaft in the midst of an otherwise natural setting, portending doom or perhaps hiding secrets, the knowledge of which confers understanding and mastery of life. In the film, humanity is driven by the puzzle the shaft embodies to attain to ever greater technological mastery over nature, yet it remains as uncomprehending as an infant in the presence of this featureless Sphinx. Thucydides' *History of the Peloponnesian War* exercises a similar effect on us. We are excited by the keen analysis, the apparent accessibility of the actors to rational interpretation, the ring of familiarity in the events the historian recounts. Above all, we are excited by Thucydides' claim to have written a work that will become "a possession for all time," a work that we will "judge useful" (I.22.4).¹ But what profit does it contain? Good counsel, a theory, an example to avoid (if so, how)? Having treated Thucydides as a forerunner of modern realism (Dougherty and Pfaltzgraff 1990, 90), international relations scholars today appreciate the complexity of his text and frequently challenge the traditional realist reading (Bagby 1994; Doyle 1991; Forde 1995; Garst 1989; Lebow 1991). Political theorists also increasingly appreciate the *History's* complexity of thought. Recently, for example, theorists have focused on its pessimism (Pouncey 1980), its pervasive humanity (Orwin 1994), its subtle critique of democracy (Farrar 1988; Ober 1993; Saxonhouse 1996), its account of the fragility of political unity (Euben 1990), or its analysis of the tension between love of glory and commitment to the common good (Palmer 1992). The growing attention to the *History* in both fields bears witness to the observation by a leading classicist that Thucydides forever proves resistant "to paraphrase and summation" (Connor 1984, 231).

In this article, we attribute Thucydides' power to

resist summation to his pervasive use of antithesis as a tool of narrative and analytical style. Antithesis in the form of paired speeches or the dramatic juxtaposition of, for example, the Periclean funeral oration and the plague narrative is well known. But Thucydides' use of antithesis in his treatment of Pericles, a part of the text usually thought to exhibit a more straightforward teaching, has commanded less attention. We investigate that treatment here, anticipating a more subtle and elaborate judgment on the Periclean virtues and a window onto Thucydides' political thought. We conclude that the historian's treatment of Pericles conveys two antithetical yet complementary attitudes regarding the possibility of conducting ourselves wisely. The first is a relentless skepticism about humanity's capacity to assure its welfare by relying on a kind of strategic brilliance that is exercised in either ignorance or defiance of moral norms. The second is a conviction that moral norms must be buttressed by the effective application of coercive power. Thucydides' driving attention to both these views goes to the heart of much contemporary theorizing in international relations regarding the appropriateness of moral or strategic action.

THUCYDIDES' USE OF ANTITHESIS

The view of the *History* as an "objective" account of the war and its author as a "scientific" historian or a detached reporter of bald fact has been dead in the specialist literature for some time. Scholars today focus more on the artistry of the work and the intensity of the experiences it elicits (see, e.g., Aron 1978; Connor 1977a; Hunter 1973; Orwin 1994). Wanting to understand how the text works as a whole, they have little confidence in the notion that the author's "teaching" can be found in some specific episode, such as the Melian conference, or in some isolated first-person comments, such as those pertaining to Pericles. Instead, they examine how the interrelations of different aspects of the text (speeches, narrative, various episodes, language patterns, and literary devices) work to arouse the emotions and intellect of the reader. In this article, we bring this strategy of reading the text to the examination of Periclean leadership.

S. Sara Monoson is Assistant Professor and Michael Loriaux is Associate Professor of Political Science, Northwestern University, Evanston, IL 60208.

¹ Unless otherwise noted, all translations are from the revised Crawley edition (Strassler 1996).

Much of the power of Thucydides' prose style derives from his use of antithesis, that is, the contraposition of claim and counterclaim in close and rhetorically effective order. Although antithesis is most evident in the paired speeches, we encounter antithetical claims pervasively. This "most instinctive, necessary clothing of [Thucydides'] thought" (Finley 1942, 46; see also Connor 1991, 67) extends to the very structure of the work, to the juxtaposition from phrase to phrase, chapter to chapter, book to book of starkly contrasting images, such that expectations nurtured at one point are dashed at another. Thucydides dresses the images up rhetorically as unchanging, inevitable realities and as matters of fact (see Connor 1984). But in the ensuing narrative he reveals them to be mere social and intellectual constructs, which the protagonists of the drama, through ambition, fear, and conceit, proceed to erode.

Awareness of Thucydides' use of antithesis helps us not only appreciate his style but also understand his political philosophy and use the text to engage debate in international relations theory. The antithesis, when wielded with the skill and relentlessness of a Thucydides, leads to skepticism, that is, to doubt regarding anything and everything that one may have previously accepted as knowledge, wisdom, or truth.² In Thucydides' era, the corrosive power of such skepticism, quite ascendant in Athenian intellectual circles, moved some Athenians to doubt the possibility of defining moral conduct in a way that would resist such inquiry. Thus, they fell victim to the idea that the prevailing notion of the Good must simply embody the interests of powerful people. This is the argument of Plato's Thrasymachus and Callicles. It is also the argument that Thucydides lends to the Athenian generals at Melos.

ANTITHESIS IN THUCYDIDES' TREATMENT OF PERICLES

We reopen the file on Pericles because he comes across as the only actor of the *History* who is "on top of things." Thucydides' attitude toward Pericles seems to be one of "reverent admiration" (Cornford 1907, 50). He is, after all, the only speaker of the *History* whose words are never disputed by those of an adversary. The text thus invites us to believe that good politics must be Periclean politics. And yet, alert to Thucydides' use of antithetical argument, we suspect that on closer reading the text invites us to search for good politics in the close, critical examination of Pericles' politics.

Thucydides' catalog of Pericles' virtues is well known, and we need not rehearse it here. Suffice it to recall that, according to Thucydides, "for as long as [Pericles] was at the head of the state during the peace, he pursued a moderate and conservative policy; and in his time its greatness was at its height" (II.65.5).

Among the virtues displayed by Pericles are his skills as a military leader (I.111.5, 114.5, 116.3, 117.2; II.31.1–2), his appreciation of and excellence in reasoned deliberation regarding political and strategic issues (II.40.2–3, 62.5), his integrity (II.13.1, 65.8), his grasp of human psychology (II.59.3ff), and his generally accurate estimate of Athenian military strengths and weaknesses (II.65.5). Moreover, he is a master of the art of persuasion. He draws on his oratorical skills to win approval of his ideas even as his popularity flags (II.59.2ff), and he uses rhetoric to stoke Athenian patriotism and self-confidence (II.40.1–41.5). In sum, his grasp of human psychology, his power to persuade, and his military skill all contribute to his ascendance among the Athenians and his ability "to lead them instead of being led by them" (II.65.8).

Nevertheless, we detect in the *History* as a whole a subtle interrogation of this explicit, glowing appraisal. While showing leadership, Pericles panders to the population; while extolling Athenian virtues, he undermines the norms of social cohesion; while advocating a prudent course of action, he engages Athens in an adventure that produces momentous turns of fortune.

Thucydides unquestionably attributes to Pericles a unique ability to persuade citizens to adopt a strategy that involves hardship and self-discipline, as well as an ability to speak frankly to the Assembly to the point of contradicting the wishes (or whims) of the multitude. During the period of Pericles' prominence, "what was nominally a democracy [became] in his hands government by the first citizen" (II.65.9). Each of Pericles' three speeches, as fashioned by Thucydides, shows the Athenian leader turning public opinion in a particular direction. Yet, on one significant point, Pericles comes across as a consummate follower, a caterer to the desires of the many. Pericles is uncritically devoted to the possession of empire for the sake of Athenian glory and for the material luxuries it provides.³ During his leadership, the Athenians boldly transfer the treasury of the Delian League from Delos to Athens and use it to finance the adornment of the city. The alliance becomes an *archē*, an empire. As crisis unfolds, Pericles positions himself as the leader most capable of protecting the empire. He calls for only momentary restraint in adding to it: "[Do not] combine schemes of fresh conquest with the conduct of the war" (I.144.1). He does not rule out enlarging it once the crisis has passed.

Although Pericles is, in many ways, quite unlike the crop of leaders that gains prominence after his death, he does not differ from them as regards this attachment to empire. Thucydides seems to acknowledge this resemblance explicitly by attributing the same startling phrase—you hold a "tyranny" (II.63.2 and III.37.2)—to both Pericles and Cleon.⁴ The term "tyranny" would

² Thucydides may have acquired his antithetical style through ties to the Sophists. On this possible link see de Romilly (1988, 86–7, 97–9), Finley (1942, 44), Hornblower (1987, 45–52, 60–2), and Connor (1984, 27–8).

³ Plato explicitly criticizes Pericles for pandering to the Athenians in this way (see *Gorgias*, 515e ff.).

⁴ Pericles says: "What you already hold is like a tyranny" (*hōs tyrannida gar ēdē echete autēn* [2.63.2]). Cleon says: "You don't appreciate that what you hold, the empire, is a tyranny" (*ou skopountes hoti tyrannida echete tēn archēn* [3.37.2]). To preserve the important parallel with Pericles' language, we depart from Strassler's (1996) rendering of Cleon's use of "tyrannida" as "despotism." For

have resonated among Athenian readers. It connotes much more than the extralegal seizure of power. It conveys the violent abuse of power and the disregard or outright rejection of customary Greek norms of decent, legitimate conduct. Contemporaries would have been struck by this term. Athenian readers would have remembered how, toward the end of the war, the oligarchs behaved so brutally before being deposed that they came to be known as the "thirty tyrants." Pericles uses the phrase during the crisis that accompanies the plague. Plague, he argues, must not weaken Athenian resolve to persevere in the war. "To take it [the tyranny]," he says, "perhaps was wrong, but to let it go is unsafe" (II.63.3). Cleon uses the term "tyranny" in another context to convince the Athenians to show severity in punishing the rebellious Mytileneans. He does not concede, as does Pericles, that taking the empire "perhaps was wrong." He defends its justice and warns the Athenians that showing mercy "will not oblige them so much as pass sentence upon yourselves. For if they were right in rebelling, you must be wrong in ruling" (III.40.4).

The difference in argument corresponds to a difference in rhetorical styles—Cleon is renowned for his verbal brutality—and to profound differences in character. Thucydides praises Pericles, the "first citizen" (II.65.9), and disparages Cleon, the "most violent man in Athens" (III.36.6). Yet, despite the contrasts, Thucydides suggests that there is some measure of continuity between them. Both sustain the public's attachment to empire. Both claim realistically to assess what that attachment requires in terms of policy and action. Both counsel steadfast resolve in carrying out policies once they are adopted. Both urge assemblies not to reopen debate on policies simply because their execution proves difficult.⁵ For Euben (1990, 178), "given Thucydides' singularly explicit castigation of Cleon and his equally explicit praise of Pericles, it is disconcerting to find so many similarities between them" (see Hornblower 1987, 122ff; Hussey 1985).

In the turmoil following the debacle at Syracuse, Athens itself falls victim to the violence of tyranny. A part of the polis turns tyrannical toward the other, just as the Athenians had turned tyrannical in their treatment of their "allies" (Connor 1984, 179–80). But when this happens, the city is victimized not only by the actions of tyrannical leaders but also by the harsh moral character that the people of Athens themselves acquire through their dealings with their empire and begin to display in their dealings with one another. The parallel that Thucydides draws between Pericles and Cleon leads us to suspect that Pericles, too, bears some responsibility for the dissolution of Athenian political life in suspicion, mistrust, and violence.

This observation invites us to examine more closely the influence of Periclean politics on Athenian virtues.

Periclean politics may not have promoted social cohesion among the Athenians as effectively as we are first led to think. Indeed, the narrative as a whole implies that Pericles' policies may (perhaps unwittingly) have accelerated the disintegration of Athenian solidarity and thus contributed to defeat. The one issue on which the narrative is thoroughly consistent, after all, is the attribution of that defeat to "intestine disorders" (II.65.12), factionalism, and growing atomization. For the Athenians, affective attachment to their status as members of the polis—their sense of democratic citizenship—pivoted on a norm of reciprocity between individuals and the polis. They imagined democratic citizenship to be characterized by mutual benefactions performed by both parties, citizens and city. In their civic self-image, a thriving democracy was not characterized by the prevalence of self-sacrificing individuals devoted to the common good. Rather, it required the successful cultivation of practices that provided multiple opportunities both for citizens (regardless of social and economic standing) to perform benefactions for the polis and for the collective—the city—to perform benefactions for the citizens. The Athenians extolled devotion to the common good in their civic self-image, but they also represented private interests and public interests as mutually obtainable. This is not to suggest that real citizens never encountered conflicts between private and public interests. Thucydides' *History*, as well as tragedy and many other literary sources, indicate that such conflict was frequent. Nevertheless, the ideal of citizenship as reciprocal exchange both defined a powerful political norm and acted as a force for social cohesion. This image of citizenship was expressed and celebrated on numerous civic ritual occasions during which individual affective ties to the polis were nourished.⁶

Thucydides makes Pericles acknowledge that Athenian democratic ideology pivots on such a view of private/public relations: "I am of the opinion that national greatness is more for the advantage of private citizens than any individual well-being coupled with public humiliation" (II.60.2). In the funeral oration, that recognition informs praise for the Athenian way of life (Monoson 1994). Yet, Pericles' war policies, however brilliant, require that the Athenians behave in ways that depart from this ideal of reciprocity. As he relates the effects of those policies, Thucydides invites us to observe how they involve the Athenians in behavior that manifests a growing tension between their civic self-image and their actual conduct and, therefore, how those policies threaten a normative understanding that had functioned powerfully to nurture Athenian solidarity.

Pericles' call to the citizens to collect behind the city walls is strategically brilliant but socially corrosive. The policy does not reward the Athenians for the suffering

sustained analysis of these passages, see Connor (1977b). For other parallels between the speeches of Pericles and Cleon, see Connor (1984, 79, n. 1).

⁵ This is the position of Cleon in the Mytilenean debate and of Pericles regarding the Megarian Decree and the strategy of collecting behind the walls.

⁶ The centrality of reciprocity in Athenian democratic ideology is increasingly noted in recent scholarship. See Farrar (1993), Kurke (1991), Millet (1991), Monoson (1994), Ober (1989), and Seaford (1994). See also Monoson (n.d.) for sustained discussion of reciprocity in the Athenian democratic imaginary.

they must endure in these unusual circumstances in the same way that the city traditionally rewards them for the more common sacrifice of the body in combat. In Athenian practice, dying honorably in battle—contributing one's body to the polis (II.43.1)—is met by particular action on the part of the polis. The soldier knows beforehand that, if he perishes, the polis will reward his "contribution" to the collectivity by attaching honor to his memory, by burying him with pomp at public expense, and by assuming certain responsibilities for his family, such as educating his orphaned children and supporting his elderly parents.⁷ Pericles' policy proposal, in contrast, does not require the city to express any explicit gratitude toward the individuals who sacrifice their property rather than their bodies to the polis. Instead, Pericles exhorts citizens to subordinate their private interests to a future public good. "Cease . . . to grieve for your private afflictions and address yourselves instead to the safety of the commonwealth," he urges (II.61.4). Pericles not only enjoins the citizens to make extraordinary sacrifices but also minimizes their importance: "You may think it a great privation to lose the use of your land and houses . . . [but] you should really regard them in the light of the gardens and other accessories that embellish a great fortune and as, in comparison, of little moment" (II.62.3).

In defense of his policy recommendations, Pericles makes no attempt at all to fit the citizens' acceptance of property loss into a model of reciprocal exchange. He may implicitly promise participation in the enduring glory and pleasures that attend citizenship in a dominant polis, but he does not stress any "exchange." Rather, he uses his rhetorical skills to shore up the citizens' resolution and their tolerance of "private afflictions" (II.61.4), offering himself as an example. He is resolute, though he, too, has lost property. He admonishes the Athenians to be strong like him: "I am the same man and do not alter; it is you who change . . . the apparent error of my policy lies in the infirmity of your resolution" (II.61.2). But he fails to appreciate that the Athenians have only himself, an extraordinary charismatic leader, to help them achieve such resolve.⁸ Their daily activity—camping out, often in deplorable conditions, behind the walls—does not provide them with the customary symbolic reinforcements and expiations that would make self-sacrifice on

this scale tolerable. Though Pericles succeeds in assuaging the anger and frustration of the Athenians, Thucydides reports that "still, as private individuals they could not help smarting under their sufferings, the common people having been deprived of the little that they ever possessed, while the higher orders had lost fine properties with costly establishments and buildings in the country and, worst of all, [had] war instead of peace" (II.65.2). Only when Pericles helps them vent their anger by accepting a fine do they finally "become less sensitive to their private and domestic afflictions" (II.65.4).

After Pericles' death the Athenians lose the ability to subordinate their private concerns to the pursuit of victory. Their new leaders, Thucydides suggests, do not supply the model and the rhetorical reinforcements they need in this regard. The Athenians lost the war because they "allowed their private ambitions and private interests . . . to lead them into [unwise] projects" (II.65.7). They fail utterly to remain fixed on the public interest and fall prey to civil discord. Pericles' policy contributes to that failure by involving the Athenians in a departure from dominant normative understandings.

PERICLES AND THE POWER OF CHANCE: THE PLAGUE

Pericles is an extraordinary leader acting in circumstances as unusual as himself. But aspects of Thucydides' narrative invite us to ask if the exceptional circumstances are not to some extent of Pericles' own making. This is not to diminish the effect of events more or less beyond Athenian control, particularly the eruption of conflict between Corinth and Corcyra. But we must recognize that Pericles' response to the events leading up to the war—abandonment of the countryside and engagement in a potentially protracted war of attrition—is an uncommon one.⁹ Thus, when the high mortality suffered by the Athenians crowded behind the city walls during the plague—an unforeseen consequence of Pericles' uncommon policy—takes away the sole leader who might have held the polis together under exceptional circumstances, we are forced by Thucydides' narrative to question the wisdom of Pericles' strategically brilliant and apparently prudent course of action. Aspects of Thucydides' narrative style, moreover, lend rhetorical emphasis to those interrogations.

Recall that Pericles recommends in his first speech that the Athenians fight a war of attrition, confident that they, because of their strategic skill, exceptional wealth, and naval supremacy, will prove able to withstand the strains of war far longer than the Peloponnesians. Pericles' recommendation that the Athenians forsake the countryside is a startling one. But he makes it sound reasonable to the Athenians, and they support it despite its unattractive features. They are confident

⁷ The Athenian polis celebrated and displayed the generous way in which the city met these responsibilities toward orphans in the "preperformance rituals" that opened the dramatic competitions on the occasion of the grandest civic festival of the year, the City Dionysia. See Goldhill (1987) and Winkler (1985).

⁸ Perhaps the success of Pericles' policies was thereby predicated on the subversion of normal institutions of Athenian democracy. This is one way to read Thucydides' famous comment regarding Pericles' relation to democratic institutions: "What was nominally a democracy became in his hands government by the first citizen" (II.65.9). Pericles' ability "at once [to] restore them [the multitude] to confidence" (II.65.9) regarding a previously chosen policy was also a capacity to oppose the democratic impulse to rethink, reconsider, reflect, and possibly decide anew. As Saxonhouse (1996) argues, steadfast devotion to a policy is a stance uncharacteristic of democratic assemblies—their distinguishing mark is the tentative, reversible status of all decisions.

⁹ During the Persian Wars, the Athenians were compelled to abandon the city by the press of combat. No such compulsion obtains at the time of Pericles' proposal.

of victory and, the reader is tempted to think, with good reason. The modern reader may see in Pericles' policies an instance of prudent realism: He diminishes the city's vulnerability to attack by land and invests in its advantage at sea. But in order to find Pericles' strategy irresistible it is necessary to discount the power of chance (*tychē*). Thucydides does not suggest that Pericles ignores *tychē*. Pericles refers to it explicitly in his first speech (I.140.1). But Thucydides does suggest that he may not appreciate its full import. Pericles sees chance as the source of possible sufferings that could threaten public resolve, but he is apparently unaware that it can be the source of deeper and more enduring effects.¹⁰

The plague provides the most devastating example of the power of *tychē* in the entire *History*. Thucydides emphasizes the plague's importance by placing its narration, with almost no transition, after Pericles' funeral oration. The brutal juxtaposition swiftly and effectively contrasts the idealized image of Athenian patterns of life articulated in the funeral oration with the actual behavior of the Athenians during the plague. In the oration, Pericles portrays the Athenians as enjoying, among other things, "ease in our private relations" (II.37.3); "[lawfulness], particularly such as regards the protection of the injured, whether actually on the statute book or belong[ing] to that code which, although unwritten, cannot be broken without acknowledged disgrace" (II.37.3); mutual trust among citizens; and confidence in their good judgment, public spiritedness, and courage. Several times he praises the Athenians for being able to endure ordeals with dignity: "We are still willing to encounter danger; we have the double advantage of escaping the experience of hardships in anticipation and of facing them in the hour of need as fearlessly as those who are never free from them" (II.39.4). He boasts: "I doubt if the world can produce a man, who where he has only himself to depend upon, is equal to so many emergencies and graced by so happy a versatility as the Athenian" (II.41.1).

When the plague hits, Thucydides reports that people initially struggle to nurse the sick and dying but often end up succumbing to the illness themselves (II.51.2). The Athenians try to bury bodies as best they can, but the majority collapse under the strain of the disease (II.52.2–4). The plague soon causes social customs (*nomoi*) to break down and give way to multiple forms of "lawless extravagance" (*epi pleon anomias*) (II.53.1). In dramatic contrast to the orderly and elaborate public funeral at which Pericles delivered his famous speech, the Athenians now neglect to perform proper burial rites for their dead: "The bodies

of dying men lay one upon another. The sacred places in which they had quartered themselves were full of corpses of persons that had died there, just as they were" (II.52.3). The Athenians panic in the face of the disease, giving the lie to Pericles' boast about their steadfastness in an emergency. They lose confidence in their judgment and act not as self-reliant and responsible citizens but, Pericles chides them, as slaves (*douloi*) (II.61.3). The rebuke is ironic, for Pericles earlier used the threat of enslavement (*doulōsin*) to justify resistance to Sparta and the adoption of his extraordinary plan (I.141.1). Athens took up that resistance but then failed to elude the servile condition that resistance was supposed to prevent. Fear and the absence of manly virtue drive the Athenians slave-like to pursue immediate personal pleasures for as long as their health permits in utter disregard for the law and social norms. "Perseverance in what men called honor was popular with none. . . . Fear of gods or law of man there was none to restrain them" (II.53.3). Far removed from the idealized Athens of the funeral oration, we now see the despair of a people besieged, casting aside its recollection of virtue and obligation. "The plague offers the most violent challenge to the Periclean attempt to exert some kind of rational control over the historical process" (Parry 1969, 116).

Thucydides sheds more doubt on Pericles' prudence by linking his strategy of abandoning the countryside to an intensification of the trials of the plague. "An aggravation of the existing calamity," Thucydides notes, "was the influx from the country into the city, and this was especially felt by the new arrivals. As there were no houses to receive them, they had to be lodged at the hot season of the year in stifling cabins, where the mortality raged without restraint" (II.52.1–2). Thucydides reports, moreover, that the plague first appeared among the Athenians only days after the Spartan invasion of Attica had begun. Athenian readers would have observed (and many would have remembered) that the plague came at what was already a most stressful time, as they gathered behind the walls and struggled to accept that their fields, livestock, orchards, and homes were, at that very moment, being ravaged by an enemy no less invisible than the plague. To underscore the severity of the Athenians' situation, Thucydides matter of factly reports that the plague never entered the Peloponnesos (II.54.5). Even though "it was actually asserted that the departure of the Peloponnesians [who enjoy the luxury of mobility] was hastened by the fear of the [plague]," Thucydides writes, "in this invasion they remained longer than in any other, and ravaged the whole country, for they were about forty days in Attica" (II.57.1–2). The reader cannot resist wondering if Pericles' understanding of prudential conduct is not somehow flawed. Pericles' embarrassment is made manifest in the more accusatory tone and rhetoric of the third speech. As spokesman for civic values in the funeral oration, he speaks of "we" and "us," but in his third and final speech he belabors the contrast between "me" and "you." References to "us" disappear (Connor 1984, 65).

Pericles' own fate highlights the limits of his power

¹⁰ See Edmunds (1975) and Orwin (1994, 25, n. 28). Orwin's position is closer to the one we defend here. Cornford (1907, 82–109) discusses the contrast between chance (*tychē*) and foresight (*gnōmē*) in the narration of the events at Pylos. We focus here on the plague because it receives such extensive treatment in the text and because it assumes such importance in Thucydides' narrative of the rapid decay of social norms. Connor (1984, 51) provides other instances of Pericles' possible lack of foresight. Cawkwell (1997, 44–5) suggests that insofar as Pericles' policy succeeds, it does so only accidentally.

to control the course of events. In Thucydides' report of the reception of Pericles' third speech, we learn that Pericles' eloquence, reputation, and forceful personality help the Athenians regain their composure and commitment to the war in the face of the devastation wrought by the plague: "He succeeded in convincing them; they not only gave up all idea of sending to Sparta but also applied themselves with increased energy to the war" (II.65.2). Thucydides never suggests that Pericles himself is not equal to the emergency, but in the midst of describing the positive effects of his third speech on the Athenians, Thucydides almost casually informs us that Pericles, too, has perished. "He outlived [the war's] commencement two years and six months" (II.65.6). Pericles might have helped the Athenians negotiate this unforeseen event, but the power of the unforeseen makes a dramatic reappearance. Pericles is dead. Thucydides could have included some description of events in Athens during the year or more that separates Pericles' third speech from his death. He could have included some narration of the circumstances of that death, but in doing so he would have eased the reader into the knowledge of Pericles' loss. Instead, the narrative leaves the reader asking: "Wait a minute, did Pericles just die?" Thucydides empowers us to experience vicariously the shock and confusion that the Athenians of the period must have felt. The text enables us not only to know but also to feel the power of chance. Thucydides' treatment of Pericles, the most gifted of Athenians, has, through the antithetical encounter of praise and disappointment, the effect of nourishing a corrosive skepticism regarding humanity's very capacity to master its destiny through the use of its intellectual powers.

HUMANITY'S DEPENDENCE ON NORMS OF MORAL CONDUCT

It would be hasty to conclude that the skepticism in Thucydides' treatment of Pericles resolves itself in "mere tragedy," in unalleviated pessimism regarding the capacity of humankind to master its destiny.¹¹ By our reading, Thucydides does not so much doubt the capacity of human intelligence to master the course of history as he doubts humanity's capacity to chart a prudent course of action while disregarding norms of moral conduct. Thucydides leads the reader to appreciate how Pericles' overweening confidence, both in his own abilities and in the advantages of his city, breeds in him and his compatriots the illusion that power has endowed them with immunity from the sanctions of norms of moral conduct, which, in Pericles own words, "although unwritten, cannot be broken without acknowledged disgrace" (II.37.3). Suspicious of Pericles' self-confidence, Thucydides invites us to observe how prudent action relies on the guidance and restraint provided by moral norms.

The most telling discussion in all of Thucydides of

the conditions under which deliberate and prudent conduct is possible is found in the famous passage on the Corcyraean civil war, or *stasis* (III.70–83). There Thucydides describes how factional conflict besets Corcyra as a result of war. The opposing factions, each emboldened by the prospect of reinforcement by an invading power, become increasingly harsh toward one another until normal political interaction is no longer possible. Violence ensues, and "the Corcyraeans engaged in butchering those of their fellow-citizens whom they regarded as enemies" (III.81.4). Under such conditions, Thucydides explains, it became increasingly difficult, and finally impossible, for both "states and individuals" (*poleis* and *idiōtai*; III.82.2) to conduct themselves prudently, moderately, and deliberately. Instead, the circumstances of *stasis* drove them to extremes, to behave with "reckless abandon" (*tolma gar alogistos*; III.82.4) and "frantically" (*emphēktos*; III.82.4). Thucydides characterizes the situation as one in which actors are unable to practice any measure of "hesitation" (*mellēsis promēthēs*; III.82.4), "moderation" (*to sōphron*; III.82.4), and "practical intelligence" (*to pros hapan xuneton*; III.82.4).¹²

Thucydides does more than assert that war makes these things happen. He shows us the mechanics of the link. War encourages actors to expect help from foreign sympathizers, freeing them from the need to treat their adversaries with consideration (III.82.2). As it disrupts normal human commerce, war makes actors desperate because it "takes away the easy supply of daily wants"; "plunges" cities and individuals into dire necessity;¹³ and ushers in a situation in which words have no stable meaning (III.82.4). Sincere good naturedness (*to euēthes*) is laughed out of court (III.83.1), and there is no trust (III.83.2).¹⁴ War disrupts the norms on which we rely for some measure of predictability and civility in daily life, the conditions of rational, deliberate, prudent action.

Thucydides' precise words at III.82.1 help us appreciate the subtlety of his insight. He pauses in his narration to note that revolution at Corcyra, being one of the first revolutions to occur, made a strong impression. "Later on, one may say, the whole Hellenic world (*pan to Hellēnikon*) was convulsed (*ekinēthē*)." What

¹² We depart from Strassler's (1996) translation of *to xuneton*, "ability to see all sides of a question," by proposing "practical intelligence," which conveys the notion of commonly understood virtue. See I.79.2, where the term is used to describe the Spartan leader Archidamus, who uses the term himself (I.84.3) to designate a characteristic virtue of the Spartans and a reason for their stability and success in war. It appears again (II.15.1) in reference to Theseus, the mythic founder of Athens as a unified polis. Thucydides applies the term, always positively, to a handful of revered historical Greek figures, including Themistocles (I.74.1 and I.138.2–3) and the Peisistratids (VI.54.5). He also applies it to actors of his history who cut a good and often brilliant figure, such as Brasidas (IV.81.2) and Hermocrates (VI.72.2), as well as in discussing the oligarchs of 411 (VIII.58.4) and by implication Pericles (II.34.6, 8). See Gomme (1945–81) II.49.377.

¹³ Thomas Hobbes offers "plunges" in translation of *piptein* (Greene 1989).

¹⁴ *To euēthes* combines "*eu*" (good) and "*ethos*" (custom or habit), and it thus designates etymologically the moral virtue of being good as a matter not of calculation but of habit.

¹¹ See Euben (1990, 194, n. 52) for an accounting of the camps (pessimist versus modernist) into which fall many interpreters of Thucydides' treatment of Pericles.

kind of convulsion did the whole Hellenic world suffer and with what consequences? The verb *ekinēthē* (a form of *kineō*, the root of “kinetic”) suggests movement and instability. The context lends the word a negative connotation, captured nicely by “convulsed.” The image is one of chaos, terrible flux, a destructive kind of motion. Yet, the verb *kineō* as such does not connote that negative image. In the first paragraph of the *History*, for example, Thucydides uses the noun *kinēsis* in an apparently neutral way. He explains that the war was “worthy of relation” because it was “the greatest movement” (*kinēsis megistē* I.1.2) in history.¹⁵ This movement engulfed all the Hellenes, the barbarians, and the better part of humankind (*pleiston anthrōpōn*). It is the physical dimensions of the “movement” (*kinēsis*) of people and materials that initially caught Thucydides’ attention and made him think the war worth writing about. What, then, endows the term *ekinēthē* with negative connotations later on (III.82.1)?

It is true that the marshaling of physical force for civil war may lend the verb a certain negative force in the Book III passage. But the intestine nature of the war is not the primary source of the negative connotation, for now Thucydides directs our attention to a more intangible yet more powerfully destructive “movement.” People and cities are losing their reserve, the power to check their motion. They are acting on impulse and fear. The things that war is now setting in motion, or stirring up, are not only men, money, resources, and ships but also the very customary understandings of what constitute “normal” human values and relationships. War is causing “the distortion of morality and values” (Hornblower 1987, 156; see also Connor 1984, 102, n. 57). The breakdown of the norms that undergird social relations, captured in Thucydides’ observation that even words lose their ordinary meanings, is leading to chaos, violence, and the pursuit of immediate wants without regard to their moral value (*pleonexia*). When those norms are “convulsed,” as they are at Corcyra, one cannot expect reason to provide a useful guide to action. Reason requires that words convey meaning, that the norms to which we commonly refer in judging the actions, intentions, moral character, and trustworthiness of others are still generally employed.

The Corcyraean *stasis* has the same effect as the Athenian plague on humankind’s capacity to act reasonably. At Athens, when physicians found themselves unable to stem the tide of plague, reason (*logos*) “was overpowered” (Connor 1984, 100). The same condition obtains in Corcyra. For Thucydides, war is a “violent teacher” (*biaios didaskalos*; III.82.2, translation modified) because it instructs by setting in motion, poltergeist-like, that which in times of peace is usually at rest. Thucydides opposes this *kinēsis* of social norms antithetically against *hēsychia*, his term for designating

peace. (*Hēsychia* literally means quiet or tranquility; the more common term for peace is *eirēnē*.¹⁶) Thucydides employs the *kinēsis/hēsychia* antithesis to highlight the parallel between *stasis* at Corcyra and plague at Athens. In both instances he opposes an image of *kinēsis* with an antithetical image of *hēsychia*. In the case of the plague, the image of *hēsychia* is developed in the funeral oration. In the case of the Corcyraean *stasis*, it is developed in the description of the Athenian purification of the island of Delos, with its long excerpt from Homer’s *Hymn to Apollo* (III.104.1–6). In both instances, Thucydides compels the reader to ponder the contrast.

PERICLES AND THE KINĒSIS OF CUSTOMARY NORMS

War and *stasis* destabilize norms and meanings and render reasonable, prudent conduct difficult if not impossible to achieve. But it would belie the complexity of Thucydides’ text to call war and *stasis* the cause of that destabilization. Indeed, war and *stasis* themselves can, to a considerable extent, be seen as the consequence of a prior subversion of moral norms. Thucydides, at V.25.1, inverts the variables. The Peace of Nicias obtains, but Corinth and other Peloponnesian cities are trying mightily to “disturb” the arrangement. The verb employed here is *diekinoun* (which appends the prefix *dia* [thoroughly] to *kineō*, discussed above). The episode invites us to take a longer view, to ask if the peace that obtained before the outbreak of war was not similarly being disturbed. We hark back to the broad indictment of Athens by the Corinthians (I.70.1–9). There we find the “daring, dynamism, innovation, audacity, immoderation, presentism, and frenetic motion” (Euben 1990, 190¹⁷) characteristic of *stasis* being applied to the conduct of Athens in peacetime: “They were born into the world to take no rest (*hēsychian*) themselves and to give none to others” (I.70.9).

The corrosive effect of “frenetic motion” saps the capacity of the Athenians as well as other Greeks to act with prudence and deliberation as the story progresses. Early in the *History*, moral norms inform the debate between Corinth and Corcyra. Moral argument provokes some hesitation on the part of the Athenians before entering into the fateful alliance with Corcyra (I.31–44; see Euben 1990, 167, 175–7). Moral scruples again cause the Athenians to rethink their policy toward the rebellious Mytilenians. They still possess the power to pause, to listen to argument, to reconsider, to check their motion and moderate their conduct. Yet, the hold of norms is clearly weakening. As

¹⁵ Connor (1984, 21, n. 4) observes that *kinēsis* “is an unusual word at this point in the development of Greek, clear enough in general meaning but obscure and surprising in this [I.1.2] context.” The inference is, therefore, that it was not lightly or casually employed by the author.

¹⁶ Thucydides generally uses the term *eirēnē* to designate formal peace treaties between cities (as well as the absence of war that results) and *hēsychia* to designate the absence of turmoil, both within the city and in relations among cities. At VI.38.3 he explicitly contrasts *hēsychia* with *stasis* and the condition in which fellow countrymen behave toward one another as toward an enemy (*polemios*). Note that the application of *hēsychia* is not limited to domestic peace (V.55.1–2). For *eirēnē*, see I.29.4 and V.13.2, 14.1, and 26.2; for *hēsychia* see I.70.9, II.22.1, and V.22.2 and 53.

¹⁷ Euben never associates those characteristics specifically with Pericles.

Euben points out, Diodotus, the advocate of restraint and decency, is compelled by the press of argument and the hubris of imperialism to "defend the more moderate human policy in relentlessly realistic terms that anticipate the Athenian arguments at Melos" (Euben 1990, 180; see Bagby 1994; Orwin 1984; Saxonhouse 1996). This argument is self-defeating in the long run. Diodotus' feigned realism saves the Mytilenians but legitimates the idea that empire, *archē*, is of necessity as oppressive as it is ineluctable and thus subverts confidence in the legitimacy and value of moral discourse. Diodotus thus unwittingly invites those Athenians who may still be willing to subject action to rational examination to shed their regard for norms of decency in favor of a facile, normatively disembodied strategic calculus. By the time of the Melian dialogue, "a travesty of dialectic" (Hornblower 1987, 62; see also Connor 1984, 87–8; Euben 1990, 198),¹⁸ the process of decay is complete. Language is not used for purposes of deliberation but as an instrument of siege. "Athens is left with self-interest alone, the desire for power without a culture to give it bounds and meaning. Not only is ambition of this sort unlimited, it is incoherent and irrational; for without a comprehensible world there can be no way of reasoning about it or acting within it" (White 1984, 79).

Thus, the norms and understandings that provide guidance to everyday social intercourse are subverted not only by violence but also by "peacetime" politics and political discourse—peacetime, that is, in the sense of *eirēnē* rather than *hēsychia*. Pericles, we can now see, plays no mean role in this history of subversion. He is "not only at home in wartime, and tolerate[s] its climate of aggression, but even foster[s] it" (Pouncey 1980, 36). At I.127.3, Pericles "urges" (*hōrma*) the Athenians to war. The verb *hōrmaō*, which Crawley translates as "urge" (cf. English "hormone"), literally means to set in motion or to rush at something or someone, as in battle. The use of this term further supports our view that Thucydides regards Pericles as a source of *kinēsis*. He takes pride in making "every land and every sea . . . the highway of our daring" (II.41.4). Thucydides portrays Pericles as a source of *kinēsis* and, indeed, embellishes on the historical record to do so (see Lebow 1991, esp. 158, n. 4; Kagan 1989).

In a passage particularly revealing of Thucydides' complex attitude toward Pericles (VIII.97.2), the short-lived Athenian experiment with a mixed constitution is described thus: "For the *first time in my experience* the Athenians appear to have governed themselves well."¹⁹ The judgment clearly embraces the government of Pericles and "implies censure of Pericles' management

of affairs" (Hornblower 1987, 160). It revives our initial suspicions regarding Pericles' statecraft. By pandering to the population, by challenging the customary understandings of the bond between citizen and polis, by implementing an extraordinarily innovative and bold war strategy that uprooted established patterns of life, by offending the allies' reverence for *autonomia* (political autonomy), Pericles is a source of *kinēsis* and contributes significantly, though perhaps unwittingly, to the deterioration of norms of social conduct. This strategy not only panders to Athenian *pleonexia*, or desire for more power and wealth, but also, by making Athens invulnerable to external assault, tries to free it from the need to cultivate "normal" relations with other Greek cities. It also tries to free the conduct of the war from the need to secure the customary way of life of the majority of Athenian citizens, who are compelled to abandon that way of life to seek refuge sine die behind the city walls.²⁰

But as Pericles and the Athenians undermine the legitimacy and influence of moral norms through rhetorical flair, brazen strategy, and unadorned violence, they not only create a revolutionary world that loses its moral compass but also prove ironically quite incapable of flourishing in the world they create. In the end, the Athenians suffer as much as anyone from the collapse of political order throughout Greece and the concomitant decay of "those general laws to which all alike can look for salvation in adversity" (III.84.3; cf. Pericles at II.37.3).²¹ The tragic lament of Nicias following the defeat at Syracuse (VII.77.1–7), with its ironic use of language previously employed at the Melian conference, makes this point with pathos.

The *History* offers a sustained exposition of humanity's dependence on moral norms—not for philosophically transcendent reasons but because they are the necessary support of prudent conduct. When those norms are in shambles, the protagonists of the *History* find it virtually impossible to chart a prudent course of action. "Thucydides' history is unquestionably aimed at an audience that values cleverness, sophistication, intellect, and self-interest, but it does not simply affirm and reinforce those values" (Connor 1984, 15). *Gnōmē* (foresight or rational calculation) trips on *tychē* (chance) or is coopted by *orgē* (passion) (Connor 1984, 55–9, esp. 58, n. 18). In some instances, "sound calculation leads to a poor outcome" (Kauppi 1991, 18; cf. Connor 1984, 118); in others, carelessly concocted schemes, such as Cleon's assault on Pylos (IV.27–41), succeed beyond hope. We see the actors of the *History* treat morality and prudence as if they were rival terms. But Thucydides invites us to consider at what cost they do so.

¹⁸ See Connor's treatment of the Melian dialogue (1984, 147–55): "Whatever our reactions to what happens to the Melians, it is hard to escape a feeling of horror at what is happening to the Athenians." (p. 154).

¹⁹ Translation from Connor (1984, 228 and n. 34), emphasis added (in conformity with the text, which stresses "my experience" with the enclitic particle *ge*). See the discussion of translation problems in Hornblower (1987, 160), who also (pp. 166–8) gives a critical examination of Pericles' stewardship, as do Lebow (1991, 254–9) and Palmer (1992, 113).

²⁰ See Ober (1991, 254–9) on the development of a defensive ideology in Athens.

²¹ Though the authenticity of III.84 is disputed, we are convinced by Connor's defense of the passage (1984, 102, n. 60).

THE ALTERNATIVE TO PERICLEAN POLICY

What are the norms, and how free was Pericles to respect them? The first question challenges us to identify specifically "international" norms, since we have already discussed the importance of norms such as reciprocity in domestic political life. This is an important issue for international relations scholarship, because "international norms" are at the core of one of the most abiding claims of realist theory: Morality is unachievable without first securing "political order" through the exercise of power (Carr 1964, chapter 9; Morgenthau 1946; Wight 1960). It follows from this claim that we can discuss morality meaningfully only as it obtains "inside" states. It is not meaningful "outside" states, in the anarchical realm of international politics and war.

G. E. M. de Ste. Croix (1972) offers a reading of Thucydides that lends some support to the realist argument. But in general the stark dichotomization between "inside" and "outside" does not hold up well in Thucydides' text, which provides grist for the mill of scholars in international relations who take the distinction to task (Kratochwil 1989; Walker 1993). It is beyond the bounds of this article to explore in any depth the norms that regulated relations among Greek *poleis*, but it is important to verify the existence of such norms in the text. Indeed, Thucydides' claim, advanced in his analysis of the Corcyraean *stasis*, that both private persons (*idiōtai*) and states (*poleis*) found prudent action increasingly difficult to achieve constitutes a rather explicit rejection of the "inside/outside" dichotomy. The text reveals here and there that a number of norms of war and diplomacy regulated the exchange of the dead (III.113.1–5; IV.97.2–98.8), the treatment of prisoners and refugees, Olympic truces, diplomacy through proxenies, the obligations of allies, and so on (see Hornblower 1987, 180).²² Perlman (1991) shows how the term *archē* evolved to become synonymous with *dynamis*, *despoteia*, and even *tyrannis*, precisely because Athens showed such disregard for the norms of *eleutheria* (freedom) and *autonomia*, which, like sovereignty and *cuius regio* in the Westphalian system, were constitutive of the Greek polis-based "international system." Indeed, Thucydides seems to experience the war as a kind of civil war within a normatively unified space. Hermocrates' efforts to forge cohesion among Sicilians, a people who "go by the same name" (*onoma hen keklēmenous*; IV.64.3), serve as a foil to the civil war that is raging on the mainland among people who are also designated by a single name, "Hellenes" (Connor 1984, 126, n. 42). Within this unified normative space, the actors in the drama, as well as the reader, are clearly able to form judgments of the moral character of leaders of opposing cities, that is, across political frontiers, on the basis of shared understandings of such goods as justice, honor, mercy, and other common virtues—at least

until those norms lose sway under the combined blows of an overweening self-confidence and self-sufficiency, war, and *stasis*. It is only when those norms become inoperative that the reader finds it difficult to develop a firm grasp of the moral character of such figures as Alcibiades and Phrynichus, who dominate the final books of the *History*.

Do we really mean to argue, then, that Pericles ignored opportunities to legitimate, reaffirm, and defend such norms of moral conduct by adopting the policy course he did? The claim gives pause because scholarship in international relations, goaded by Thucydides' claim that the war was "inevitable" (I.23.6),²³ has become accustomed to trying to understand the text in terms of "necessary outcomes." It therefore seems odd to think of Pericles as something other than an extraordinary leader confronting the great forces of history. But, in addition to Lebow's (1991) well-argued complaint that the popular "power transition" reading of "necessity" is not much supported by the text, it is simply impossible to identify any recurring set of factors in the *History* that render some pattern of outcomes "necessary." It is true that "the Archeology" (Thucydides' digression on the pettiness of previous history in comparison with this great war [I.2–23]) seems to suggest such a theme by alerting the reader to the role of "historical forces" in the genesis of the *History*. But Thucydides' interest in "historical forces" evident in the Archeology all but vanishes in the narrative of the war. "There is, in Thucydides, no systematic treatment of Spartan and Athenian weaknesses other than those of character" (Hornblower 1987, 33). As the narrative unfolds, the attention paid to individual moral character grows rather than diminishes. In the final books, the historian's attention seems to fixate on the moral character of two figures: Nicias and Alcibiades. By paying so much attention to character, Thucydides seems to embrace the belief that "individual human action can change the course of history" (Hornblower 1987, 146; see also Kauppi 1991, 112).

What, then, could Pericles have done otherwise? The question should probably be resisted because it distracts from the text and entangles us in potentially unresolvable debates about counterfactuals. For purposes of illustration only, we will mention one thing, among others, that Pericles might have done otherwise: He could have devised an honorable way to revoke the Megara Decree. Thucydides reports (I.139.1) that lifting the embargo against Megara may well have satisfied Sparta and forestalled (and perhaps avoided) war. In his speech, Pericles acknowledges that some (or many) Athenians look on the Megara Decree as "a trifle" (*to brachy ti*), and he suggests that by refusing this trifle Athens takes a bold and significant step that demonstrates its resolve (I.140.4, 5). But Pericles, perhaps because he authored the "trifle," does not entertain the possibility that to concede it might prove as constructive as refusing it proves provocative. Lifting

²² At IV.97–8 is an interesting debate regarding what should be regarded as custom (*nomos*) and what should not. See also Connor (1984) on Mytilene (p. 91) and on Nicias (p. 163); and Ducrey (1986, chapter 9) on treatment of prisoners of war.

²³ The use of "inevitable" for *anankasai* is controversial. See Connor (1984, 32, n. 31).

the decree would do more than satisfy the Spartans. It would convey Athenian commitment both to the norm of *autonomia* that attaches to the *polis* and to the sanctity of its treaty with Sparta, and thus enhance the authority of normative restraint. It would, moreover, challenge Sparta to reciprocate. Nor would it foreclose the ability of Athens to prosecute its complaint against Megara. The Athenians might be obliged to accept Sparta as a party to that prosecution, but given Megara's poor relations with Corinth and its record of diplomatic fickleness, Sparta might well lend Athens a sympathetic ear. In the event of a rebuff, the decree (which apparently did not contravene the treaty) could be reimposed. Pericles' refusal to give this course of action serious thought seems to flow as the unexamined consequence of his principled rejection of any and all meaningful negotiation with the Spartans (I.127.3, 144.3; II.12.2). It also may have its source in the hubris of a "first man" who simply cannot contemplate reversing himself.

HERMOCRATES AT GELA: REALISM, PRUDENCE, AND MORAL NORMS

Thucydides' demonstration of our dependence on moral norms dilutes his realist credentials. In a provocative article, Forde (1995, 154) has suggested that Thucydides even counsels us to "resist" realism. But our alertness to Thucydides' unrelenting recourse to antithetical reasoning makes us pause before advancing categorical statements regarding his teaching. Nicias, after all, resists realism, and the outcome is less than impressive. Recall, moreover, the Archeology's account of the mastery and accumulation of political and military power by the Greeks, the devolution of that power on Athens as set out in the Pentekontaetia (Thucydides' discussion of the growth of Athenian power during the fifty years between the Persian and Peloponnesian wars at I.88–118.2), and Thucydides' amazement at the dimensions of the *kinēsis* with which he introduces the *History*. How could we expect normative restraints to operate effectively when history confers such an overwhelming advantage on a people? The claim that power politics is ineluctable pervades the *History*. In the words of Diodotus, "it is impossible to prevent, and only great simplicity [*euētheias*] can hope to prevent, human nature [*tēs anthrōpeias physeōs*] doing what it has once set its mind upon [*hormōmenēs*], by force of law [*nomōn ischyi*] or by any other deterrent force whatsoever" (III.45.7). The difficulty with Thucydides is finding a coherent rule or prescription in the relentless succession of antithetical claims. How does one reconcile the claim that prudent politics requires guidance by moral norms with the claim that power politics is inevitable? Looking to the text, we find a clue in the remarkable speech delivered by the Syracusan Hermocrates in Book IV.

Hermocrates wants to promote reconciliation between two feuding Sicilian cities, Gela and Camarina, in order to avoid Athenian intervention. He begins by making clear Athenian interest in the feud. Athens, he

claims, seeks to ally itself with certain Sicilian cities only as a first step toward subjugating the entire island. Moreover, those ambitions are, he states in a realist-sounding utterance, "very excusable," since "it is just as much in men's nature to rule those who submit to them as it is to resist those who molest them" (IV.61.5). Hermocrates urges the two cities to settle their differences so that Sicily can unite to dispel the Athenian threat. But why should the cities of Sicily join in the collective defense of their island rather than bandwagon or balance by individually joining either the Athenian or the Spartan alliance? Realism counsels only the course of action that is most likely to succeed at the lowest cost. Hermocrates, however, evokes the sentiment of Sicilian identity: "We are neighbors, live in the same country, are girt by the same sea, and go by the same name of Sicilians" (IV.64.3). But what is so important about being "Sicilian"? It is not a source of nationalist sympathy or solidarity. Indeed, national sentiment is held in check by the more ancient rivalry between Dorians and Ionians. The idea of Sicily, for Hermocrates, refers rather to a geographic space where, through the repeated interactions of its cities, a set of shared norms has evolved to facilitate interaction, deliberation, and the settlement of grievances. "Do you not think that the good which you have," he asks, "and the ills that you complain of, would be better preserved and cured by quiet [*hēsychia*] than by war" (IV.62.2)?

Hermocrates greets with skepticism the self-assurance that is bred of power and strategic cleverness. He asks his listeners not to fall prey to the illusion that strength is sure because it is confident (*euelpi*) (IV.62.4). Given that skepticism, he equates prudent action with the defense of Sicily as a normatively coherent and functioning space. He likens war among Sicilian cities to civil war. He evokes civil war using the forceful term *oikeios polemos* (IV.64.5) rather than the more technical *stasis*. The expression produces a powerful image of war in the household (*oikos*). He invites his listeners to feel terror (*ekplagētes*), not only in the presence of the Athenians but also before "the undefined fear of this unknown future" (IV.63.1). *Ekplagētes* means frightened out of one's wits and is laden with rhetorical force. The image of civil war, that is, the destruction of a space and of the facilities for prudent action that space provides, should inspire terror. Terror, in turn, should inspire concessions on the part of the feuding cities in order to preserve that normative space. Hermocrates' argument evokes with irony the words of Pericles, who sought not only to stir confidence in Athenian power and strategic skill but also to inspire disdain for the adversary: "Disdain [*hyperphron*]," Pericles states, "is the privilege of those who, like us, have been assured by reflection of their superiority to their adversary" (II.62.4). In this same vein, Hermocrates' invitation to make concessions contrasts sharply with Pericles' principled rejection of meaningful negotiation.

But Hermocrates realizes that power can cause people to "confuse their strength with their hopes" (IV.65.4). He realizes that the temptation to test one's

power is strong. The defense of Sicily as a normative space will therefore probably require the countervailing application of military power. Hermocrates is not a peace activist. He is trying to forge an alliance. He admits, as does the realist, that violence is inevitable or "natural" in human affairs. He admits that Sicily's cities will probably wage war on one another again (IV.64.3). But he conceptualizes prudent action as participation in that violent struggle with the goal of preserving the social norms that make prudent action possible. He does not invite us to resist realism but to apply the realist's alertness to the permanence of power and violence in human affairs in defense of norms of moral conduct. Pericles, in contrast, knows how to acquire and apply power, and Thucydides values that mastery. But what is missing in Pericles is a full appreciation of what one might do with power such that the normative conditions for its intelligent and prudent application can be sustained.

Hermocrates' speech and policy seem antithetical to Pericles' earlier speeches and policies. They do not engage one another immediately, but they do engage one another at the level of theory. We submit that the antithesis between Pericles and Hermocrates contains a prescriptive lesson. At the same time, however, we acknowledge how difficult it is to pin Thucydides down. Sicily does not unite for long. Hermocrates, moreover, may merely be seeking to assert Syracusan hegemony over the island (though the exercise of the hegemonic power is not per se incompatible with the defense of norms). At another time he employs a remarkably different language that emphasizes ethnic solidarities: "We protest that we are menaced by our external enemies the Ionians, and are betrayed by you our fellow Dorians" (VI.80.3). And when the Athenians finally invade, the Sicilians meet them in disarray. Inversely, Thucydides employs all his rhetorical skills to concentrate our minds on Hermocrates' words at IV.59–64 and lend those words centrality. The scene provides us with our first introduction to Sicily and Syracuse, the principal instruments of Athens's defeat, and to Hermocrates, a central figure in that defeat. At Gela, moreover, Hermocrates gives the only speech, a privilege that compels the comparison with Pericles. Finally, his speech follows immediately and antithetically on the Athenian triumph at Pylos, an unexpected victory and the highwater mark of the city's fortunes.

It is for all these reasons, and because our suspicions are supported by so many other elements of the text as a whole, that we believe the antithetical opposition between the two statesmen, Pericles and Hermocrates, contains a prescriptive lesson. We might formulate that lesson in three parts: Power can be entrusted only to people (1) who enjoy a healthy skepticism regarding their own (and humanity's) capacity for clever strategy, (2) who are inclined by that skepticism to be respectful of social norms, which they value for the prudent guidance they provide, and (3) who will use power to defend (or help craft) those norms, ever alert to humanity's tendency to fall

victim to the illusion that power confers freedom from moral restraint.

THUCYDIDES AND CONTEMPORARY THEORY

Both the prescription and the skeptical premises in which it is lodged directly engage modern theorizing in international relations. Thucydides' skepticism, as conveyed by his antithetical style of analysis, invites us to revisit realism, whose ties to skepticism have been noted but not systematically explored (see Beitz 1979, chapter 1; Cohen 1985; Loriaux 1992). For example, while doubting the claim that there is such a thing as a "realist tradition," Walker (1993, 17) nevertheless emphasizes the skepticism that is common to the great thinkers who are usually assigned to that tradition. He writes of a "Rousseauian skepticism," a Machiavellian challenge to "universalist pretensions," a Weberian acquiescence "in a complex and widespread skepticism about modernity" (Walker 1993, 4, 47, 56, 110). Realists rely on skepticism regarding humanity's aptitude for moral improvement to justify their attention to power politics and self-help. Pericles himself, by this definition, is a realist. Indeed, the label fits not only his attitude toward policymaking but also the philosophical premises underlying that attitude. Pericles, like Thucydides, had ties to the Sophists. He was closely linked with Protagoras, and his consort Aspasia animated a lively intellectual "salon" in which Sophistic thought flourished. Pericles may have drawn more or less self-consciously on Sophistic skepticism in order to "clear the decks" of received wisdom and thus make room for his strategic innovations.

But Thucydides' subtle critique of Pericles questions the realists' ability to ground their political philosophy in skeptical premises. Skepticism in Thucydides spreads from doubt regarding humanity's capacity for moral improvement to doubt regarding humanity's capacity to flourish while ignoring or defying moral norms. Thucydides excites such skepticism even when statecraft is, as in Pericles' case, apparently prudent, and even when the conceptualization of the policy is, as in Pericles' case, brilliant. It is difficult to think of a realist argument that might stave off this metastasis of skepticism from doubt regarding human morality to doubt regarding the human intellect's self-sufficiency. Thucydides, in any event, "makes it clear where he stood: it is not with the sophists who denied the validity of any principle of morality but a short-sighted self-interest" (Hornblower 1987, 185, citing Gomme 1945–81).

Thucydides' invitation to appreciate how norms function as a condition for prudent action also intersects with the new constructivist literature on norms and law (Finnemore 1996; Katzenstein 1996; Klotz 1995; Kratochwil 1989; Lynch n.d.; Wendt 1992). The *History* shows how norms can function in a nondeterminist manner to provide guidance to deliberate and prudent action. Thucydides' reliance on a skeptical outlook suggests a way that proponents of constructivism might philosophize about the foundations of that

perspective.²⁴ Inversely, his acknowledgment of the inevitability of power relations should inspire caution in constructivists as they mount their assault on realist theory. His account of politics in extraordinary times suggests that we can, and should, assess the possibility of supporting or unsettling norms through material struggle.

We cannot develop these ideas here, but we raise them to recall Thucydides' capacity to confront each generation's particular theoretical enthusiasm with challenging and even deadly objections. In our view, his capacity to resist encapsulation—not his putative status as the founder of one or another school of thought—remains the reason his work stands as a "possession for all time."

²⁴ Kratochwil (1981) sets out from David Hume. There is a parallel between the argument developed here and Hume's own rediscovery of the norms of the "common life" through the exploration of skeptical premises. Compare Michael Oakshott's influence on Terry Nardin (1983).

The Public's Conditional Response to Supreme Court Decisions

TIMOTHY R. JOHNSON *Southern Illinois University-Carbondale*

ANDREW D. MARTIN *State University of New York at Stony Brook*

To investigate the effect of the Supreme Court on public opinion, we offer the conditional response hypothesis based on a theory of Supreme Court legitimacy and a microlevel social-psychological theory of attitude formation. Together these theories predict that the Court may affect public opinion when it initially rules on a salient issue, but that subsequent decisions on the same issue will have little influence on opinion. To test our predictions, we analyze public opinion data before and after the Supreme Court ruled in a highly visible abortion case (Webster v. Reproductive Health Services [1989]) and before and after three key capital punishment rulings (Furman v. Georgia [1972], Gregg v. Georgia [1976], and McCleskey v. Kemp [1987]). The results suggest that our theory is not issue bound but is generally applicable to how the Supreme Court affects public opinion when it rules in highly salient cases.

In the years leading up to the Supreme Court's decision in *Roe v. Wade* (1973), debates over abortion became quite heated, but judicial scholars would have predicted a diminution in the high level of public controversy after the Court ruled. Indeed, the prevalent theory of the day was that when the Supreme Court made decisions, the public simply accepted them as legitimate. This theory—established by Dahl (1957) and labeled the positive response hypothesis by Franklin and Kosaki (1989)—suggests that there was nothing more to discuss after *Roe* because the Court had established a clear constitutional right to abortion on demand during the first trimester of pregnancy. Whether or not an individual agreed with this position before *Roe*, she would at least accept it as law after the decision because the Supreme Court was seen as the ultimate arbiter of the law. If this were the rule and not the exception, however, then the public debate concerning abortion should have dissipated in the wake of the *Roe* decision. Clearly, history does not support this conclusion.

While *Roe* provides only one example of how the positive response hypothesis fails to capture the Court's ability to affect public opinion, it suggests to many scholars (e.g., Franklin and Kosaki 1989; Hoekstra and Segal 1996) that Court decisions do not necessarily decrease public controversy. Sometimes public debate increases in the wake of Supreme Court decisions. This leads us to believe that the traditional theory of the relationship between Supreme Court decisions and public opinion is suspect.

We offer a theoretical framework that approaches the puzzle of how the Supreme Court affects public

opinion in a novel manner. Specifically, we seek to answer when, if ever, the Court affects public attitudes when it makes decisions. We derive our framework from theories of Supreme Court credibility as well as from a variation on a social-psychological model that suggests that (1) individuals form opinions about an issue when they are provided with information about it, and (2) once individuals form opinions, they do not readily change their mind. With this foundation, we generate predictions about how and when the Court will influence public attitudes about two specific issues: abortion and the death penalty.

EXISTING THEORIES

Judicial specialists offer two competing theories to explain the Supreme Court's effect on public opinion. The first, initially advanced by Dahl (1957), focuses almost exclusively on how the Court legitimizes its own policies or those of the other two branches of government. Building on Dahl's theory, a number of scholars hypothesize that when the Court takes a position on an issue, overall public support for that position inherently increases (for a complete review of this literature, see Hoekstra and Segal 1996). In other words, because the Court is perceived as the ultimate arbiter of the law, its decisions are viewed as legitimate, credible, and therefore correct. This theory, labeled the positive response hypothesis by Franklin and Kosaki (1989), predicts that the public listens to the Court and always supports its decisions.

Franklin and Kosaki (1989) empirically test the predictions of the positive response hypothesis and demonstrate that it cannot account for how the structure of public opinion toward abortion changed in the wake of *Roe v. Wade* (1973). In its stead they offer the structural response hypothesis, which predicts that in highly salient cases the Court's policy choices do not necessarily translate into an aggregate increase in positive attitudes toward its position on that issue. Rather, while citizens often accept the Court's choices, their reactions are affected more strongly by the political context within which they live (see, e.g., Huckfeldt and Sprague 1995). In addition, the structural response hypothesis predicts that the Court has a microlevel

A previous version of this manuscript was presented at the 1996 annual meetings of the Southern Political Science Association, Atlanta, Georgia, and won honorable mention in the 1996 Congressional Quarterly competition for the best graduate-level paper in the field of law and courts. The authors thank Lee Epstein, Valerie Hoekstra, Christina Wolbrecht, and the anonymous reviewers for their comments and helpful insights throughout the writing of this manuscript. However, all remaining mistakes are our own.

effect on public opinion because it increases the intensity of within-group opinions about particular issues. The general point is that the Court does not necessarily legitimate particular policies (although it may, if aggregate public opinion favors a particular policy choice before a decision) but affects attitudes by bringing issues into the public discourse.

The empirical evidence presented by Franklin and Kosaki (1989) is quite compelling. They find that levels of support for abortion on demand diverged between groups (e.g., Catholics versus non-Catholics; whites versus nonwhites) in the wake of *Roe*. More specifically, the difference between these groups changed by approximately 50% as a result of the Court's decision (p. 762). This leads Franklin and Kosaki to posit that the effect of *Roe* was further crystallization of issue preferences and greater homogeneity of within-group beliefs (p. 762). From this they conclude, in line with the structural response hypothesis and contextual theory, that the Court's decision polarized group attitudes toward abortion.

Despite these strong findings concerning public opinion toward *Roe*, two key questions arise about the applicability and generality of Franklin and Kosaki's model. Does the Supreme Court continue to affect public attitudes when it rules on a salient issue more than once? If so, do between-group attitudes become more polarized each and every time the Court rules on that issue? In order to understand the extent to which the Court affects public opinion, we must come to terms with how and when the public reacts to decisions in more than one case and in more than one issue area. To find the answers we turn to theories about Court credibility (e.g., Caldeira 1986; Caldeira and Gibson 1992) and to social psychological theories of attitude formation and change (e.g., Chaiken 1980; Fiske and Taylor 1991; Petty and Cacioppo 1981; Petty and Krosnick 1995).

INFORMATION, CREDIBILITY, AND ATTITUDE CHANGE

We provide an alternative to the positive response hypothesis and an extension of the structural response hypothesis. More specifically, we offer a variation of the social-psychological elaboration likelihood model to explain how the Supreme Court affects public opinion. Our model is based on two different theories. First, because the public generally views the Court as a highly credible institution (Caldeira 1986; Caldeira and Gibson 1992; Hoekstra and Segal 1996), individuals more clearly elaborate their attitudes toward an issue after a ruling (although they do not necessarily agree with the decision). Unlike the positive response hypothesis, however, our account suggests only that the public pays attention to and discusses major decisions because of the Court's high degree of legitimacy. In other words, as a credible source of information, when the Court makes its first major decision on a particular issue, the structure of public opinion changes in a manner consistent with the structural response hypothesis. That is, even if individuals disagree with a particular decision,

their opinions on that issue will crystallize (become stronger) for or against the Court's policy choice.¹

To support this part of our model, we draw on research demonstrating that even people who know very little about the Supreme Court often hold it in high regard. For instance, Caldeira and Gibson (1992, 635) argue that "the Supreme Court has traditionally fared well in the estimations of the public." Other works suggest that individuals perceive the Court as highly legitimate simply because it is the ultimate arbiter of the law (Adamany 1973; Adamany and Grossman 1983). While we take issue with the conclusions of these latter works, the authors do make a point with which we agree: The public would never even pay attention to the Supreme Court if it were not viewed as a legitimate institution. Thus, as Hoekstra and Segal (1996, 1097) point out, individuals may hold well-defined attitudes toward an issue, but the Court will still have an effect on those opinions because of its high degree of legitimacy.

The first part of our model also draws on two key studies from social-psychological theory. Chaiken (1980) studies the persistence of attitude change based on different source and message characteristics. Specifically, she is interested in the likelihood of attitude change when an individual is presented with the same information more than once. To test this process Chaiken uses an experimental setting to explore how attitudes change when individuals are presented with similar information on two separate occasions. She finds that, after subjects heard the same information a second time, "there was a trend for all subjects to show less persuasion" (quoted in Petty and Cacioppo 1981, 259). Furthermore, those presented with information about an issue of high consequence (highly salient for them) were even less likely to change attitudes.

Chaiken's work is consistent with the elaboration likelihood model, a commonly used model of persuasion, which demonstrates that once an issue is elaborated to the extent that individuals form opinions, further elaboration, even if it is in conflict with their opinion, will tend not to change that opinion (Petty and Cacioppo 1981). Petty and Cacioppo (p. 263) find that the intensity of cognitive processes influences the propensity for attitude change: "In studies where issue relevant cognitive activity was likely to be intense . . . the attitude changes produced have been found to be relatively enduring." Together with the theories about Court credibility, this work establishes the first part of our model.

The second part of our model relies exclusively on the elaboration likelihood model. We argue that once the Supreme Court helps individuals elaborate their opinions, subsequent decisions within the same issue area—even if they overrule an initial landmark decision—will have little effect on public opinion. In short,

¹ Of course, there are other reasons a first major decision may affect public opinion. One alternative explanation is that the media are much more inclined to cover a new landmark decision (see, e.g., Slotnick, Segal, and Compoli 1994), and the public response may be related to the great amount of coverage.

even though the Court is still viewed as a credible institution, people will not change opinions formed on the basis of the Court's prior decision.

In sum (1) the Supreme Court is viewed as a credible and legitimate institution; (2) individual's opinions on certain issues crystallize when the Court decides its first major case in a highly salient issue area because those opinions are affected by the Court's policy choices; and (3) opinions about the Court's policy choices are unlikely to change once they are set, even when the Court rules again on the same issue. We call this the *conditional response hypothesis* and posit the following two hypotheses:

HYPOTHESIS 1. *When the Supreme Court makes its first major (landmark) decision in a salient issue area, increased cleavages will occur in between-group attitudes about an issue, and there will be an overall change in public opinion toward that issue.*

HYPOTHESIS 2. *When the Supreme Court decides subsequent cases within the same issue area, little if any change will occur in the structure of group attitudes toward that issue regardless of the direction, intensity, or breadth of the decision, and there will be no overall change in public opinion toward that issue.²*

Each hypothesis is tested separately. Hypothesis 1 involves cases in which the Court makes its first landmark decision in a given issue area. Hypothesis 2 involves subsequent cases concerning the same issue. The findings of Franklin and Kosaki (1989) serve as an initial test of Hypothesis 1, since *Roe* was the Supreme Court's first major and highly visible abortion decision. Another highly visible abortion case (*Webster v. Reproductive Health Services* [1989]) is used to evaluate Hypothesis 2. This analysis is meant to discern whether the Court had a similar effect on public attitudes toward abortion in both cases. We argue that *Webster* is an ideal case with which to test our second hypothesis since it was the first (and arguably the best) chance to strike *Roe*, thus making it highly controversial.³

² Implicit in both of these hypotheses is the following null hypothesis: When the Supreme Court makes a decision, there will be no changes in the structure of public opinion. The null hypothesis affects how we can interpret our results. In our tests of Hypothesis 1, statistically significant results can lead us to reject the implicit null hypothesis, thus yielding credence to Hypothesis 1. For our tests of Hypothesis 2, statistically insignificant results allow us to maintain the null (fail to reject the null), thus yielding credence to Hypothesis 2. We have worded our hypotheses positively to enhance the readability of the paper.

³ There were other cases before *Webster* (e.g., *Akron v. Akron Center for Reproductive Health* [1983]), but *Webster* was still the best chance because the Court finally had a conservative majority. As Justice Blackmun said prior to *Webster*: "Will *Roe v. Wade* go down the drain? I think there's a very distinct possibility that it will, this term. You can count the votes" (Epstein and Walker 1995, 462). Aside from being the best opportunity to overturn *Roe*, *Webster* was important for showing how the Court would view specific state regulations on abortion. More specifically, in *Webster* the Court had to decide the constitutionality of a Missouri law which stated that (1) life begins at conception; (2) public employees could not perform abortions not necessary to save the mother; (3) public employees could not counsel women to choose abortion; and (4) physicians must test women to be sure the gestational age of the fetus is less

DATA AND MODELING STRATEGIES

Data for our test are drawn from two CBS News/*New York Times* polls (1989a, 1989b) concerning public attitudes toward abortion during summer and autumn 1989.⁴ The first poll was conducted two months prior to the *Webster* decision, and the second three months after. With data of this nature (about the same issue and of approximately the same importance as *Roe*), we can test Hypothesis 2.⁵

Our dependent measure is the number of circumstances, from a list of possible choices, in which a respondent would permit a legal abortion. Because the first survey listed five possible scenarios for abortion, and the second listed seven, we construct a scale from 0 to 2 and match only the common reasons from each survey, ranging from 0 (no instances of legal abortions) to 2 (two or more instances of legal abortions). While this is not a perfect solution, it still captures the circumstances under which an individual believes abortion should be legal. With these data, we construct two separate abortion scales: One reports responses to *Health-related* reasons for abortion, and the other reports responses to *Discretionary* abortions (see the Appendix for definitions of these two scales).⁶

To explain how group attitudes may have changed after *Webster*, we specify a model with several independent measures (*Education, Gender, Race, Catholic Adherents, and Frequency of Church Attendance*) to capture the extent to which attitudes toward abortion are affected by the Court. Not only are these variables theoretically pleasing, but also, because Franklin and Kosaki (1989) invoke them, we can make direct comparisons to their findings. Furthermore, these variables allow us to draw out the relationships among group membership, individual characteristics, and attitudes toward abortion.

We also include a dummy variable, d_1 (which we interact with all the independent variables), to discern whether attitudes prior to the decision change afterward. This *Postdecision Dummy* equals 0 before the decision and 1 afterward, so that it may interact with

than 20 weeks (adapted from Epstein and Walker 1995, 463). Finally, *Webster* was so controversial that 78 amicus curiae briefs were filed, representing more than 5,000 interested parties. All this suggests that *Webster* was highly salient and controversial.

⁴ These data were provided by the Inter-university Consortium for Political and Social Research. The two studies used are the CBS News/*New York Times Monthly Poll* (1989a); and the CBS News/*New York Times Abortion Polls* (1989b). The recoded data may be obtained from the authors to replicate this study.

⁵ Because the interest is in the short-term effect of the decision, it is important and intuitive to use data as close to the decision date as possible. We argue that our data are quite good because they were obtained within months of the Court decision.

⁶ Because we do not have exact matches for the pre- and postdecision samples, and because there are fewer health questions in the predecision sample, we had to modify Franklin and Kosaki's (1989) technique. Thus, our index combines the responses, so that we had a scale ranging from 0 (abortion should not be permitted under any circumstances), to 1 (in only one instance should abortion be legal), to 2 (in two or more instances abortion should be legal). Although this is not a perfect solution, our marginal distributions on both abortion scales are quite similar to those of Franklin and Kosaki (1989). Thus, this technique does not seem to bias our results.

the $\beta_{2,k}$ coefficients (the postdecision individual characteristics). As Franklin and Kosaki note (1989, 755–6): “The coefficients in this model are specified so that they may vary between the predecision and postdecision samples.” The equation we estimate, then, is the following:

$$y = \alpha_0 + \alpha_1 d_1 + (\beta_{1,1} + \beta_{2,1} d_1) x_1 + \dots + (\beta_{1,k} + \beta_{2,k} d_1) x_k + \varepsilon. \quad (1)$$

The second equation we estimate constrains d_1 to 0, thereby suppressing the interaction effect with the $\beta_{2,k}$ coefficients.

$$y = \alpha_0 + \beta_{1,1} x_1 + \dots + \beta_{1,k} x_k + \varepsilon. \quad (2)$$

We only invoke this constrained model (and report the results) for use in a likelihood ratio test, which helps us explain whether an overall change occurs in aggregate group feelings toward abortion after the Court's decision.

Because our dependent variable consists of discrete ordinal numbers (0, 1, or 2), traditional linear regression is an inappropriate method for testing our hypotheses. Indeed, Greene (1993, 672) notes that OLS errs by taking the discrete rankings and treating the differences as the same, and he argues that a standard logit or probit model also cannot account for the ordinal nature of the dependent variable. He contends that (under certain conditions) an ordered probit model is the best way to estimate models with discrete dependent variables (p. 673). We therefore turn to this model, first offered by McKelvey and Zavonia (1975), because it takes into consideration the ordinal nature of the data by treating each observation only as a rank ordering. We estimate these models using maximum likelihood estimation (see McKelvey and Zavonia 1975 or Greene 1993 for the derivation of this model and its likelihood function). In each model, a positive coefficient indicates an increased likelihood that a respondent believes more instances for abortion should be legal, while a negative sign indicates that she thinks there should be fewer instances of legal abortion.

A comparison of the constrained and unconstrained models allows us to test whether the postdecision characteristics are jointly constrained to 0 (meaning the overall structure of opinion did not change because of *Webster*). Therefore, the difference in the $\beta_{1,k}$ and $\beta_{2,k}$ coefficients before and after the decision tests the extent to which the structure of between-group attitudes changes as a result of a particular Court decision. As Kmenta (1986, 491) suggests, “if we wish to test the validity of nonlinear restrictions rather than assuming it *a priori*, we can use . . . the likelihood test.” We can observe the difference in the likelihood function between the constrained and unconstrained models, which is -2 times the change of the log of the likelihood function, distributed as chi-squared, with degrees of freedom equal to the number of constraints. The results of this test allow us to make different claims about each hypothesis. When testing Hypothesis 1 we expect at least some of the postdecision $\beta_{2,k}$ coeffi-

cients to be statistically significant, α_1 to remain small, and the likelihood ratio test between the constrained and unconstrained models to reach statistical significance.⁷ If this happens, then we can reject the implicit null hypothesis that the structure of opinion did not change. For Hypothesis 2, however, we expect few if any of the postdecision $\beta_{2,k}$ coefficients to be statistically significant, α_1 still to remain small, and the likelihood ratio test not to reach statistical significance. These results would maintain Hypothesis 2—shifts in public attitudes did not occur when the Court ruled in subsequent cases in the same issue area.

RESULTS

As stated above, we accept the findings of Franklin and Kosaki (1989) concerning the public's reaction to *Roe* as support for Hypothesis 1. That is, the public in general reacted to the Court's decision, and the views of several social groupings (such as Catholics and non-Catholics) became strongly polarized. Our first test, then, focuses on Hypothesis 2. We estimate a model for those respondents who had heard of the Court's decision in *Webster* (see the Appendix for the distributions of all variables used for the model).⁸ Table 1 presents the constrained and unconstrained models for both the discretionary and health-related abortion scales. The sample includes all the respondents in the predecision sample but only those in the postdecision sample who said that they had heard of *Webster*. Note that while some of the predecision signs may seem counterintuitive (Catholics have a positive sign in the discretionary model), only education and church attendance are significant predictors of polarized attitudes toward abortion prior to *Webster*. Those with higher education are more supportive of abortion than those with lower education, and those who attend church more frequently are less supportive than those who attend less frequently.⁹

To demonstrate whether attitudes toward abortion changed as a result of the Court's action, we turn to the postdecision coefficients in the unconstrained model. As our second hypothesis predicts, there is little or no change in the estimated coefficients from the predecision to the postdecision attitudes. The most striking change is that the sign on Catholics who had heard of *Webster* becomes negative after the ruling in the discretionary model. This change is marginal evidence, at

⁷ The null hypothesis is that none of the coefficients will be different from zero, so if more than one is statistically significant, then there is support for our hypothesis.

⁸ We follow Franklin and Kosaki (1989) in this respect because, if we did not distinguish between those who heard of the *Webster* decision and those who did not, then we would be left to answer the same questions, namely, “How do we sort out the impact of the decision from the spurious influence of other factors? To what do we attribute the change?” (Franklin and Kosaki 1989, 754–5). By truncating the sample and only using those who heard of the decision, we should be able to parcel out the effect of the Court's decision. Thus, we only run this model for those who had heard of the decision.

⁹ As do Franklin and Kosaki (1989), we fix the church attendance coefficient because preliminary analysis showed no tendency whatsoever for this effect to change in the wake of *Webster*.

TABLE 1. Estimated Abortion Responses for Respondents Who Have Heard of Webster (Ordered Probit Estimates)

Parameters	Models for Discretionary Abortions		Models for Health-Related Abortions	
	Unconstrained	Constrained	Unconstrained	Constrained
Constant	.36* (.15)	.27* (.13)	2.02*** (.18)	1.92*** (.16)

best, of polarization between Catholics and non-Catholics ($t = 1.79$), which accords with Hypothesis 2. In general, these models perform quite well, reaching highly significant chi-squared values of 258.2 and 172.1 for the discretionary and health scales, respectively (d.f. = 10). No reliable evidence exists that the Court affected intergroup attitudes toward abortion with its *Webster* decision, however, because no postdecision coefficient is significantly different from zero.

To test whether the overall structure of opinion changed, we next compare the constrained and unconstrained models (refer to Table 1). The first test compares the discretionary abortion scale models, and it is evident that the overall structure of opinion did not change—the chi-squared value of the difference between the constrained and unconstrained models only reaches 6.66 with four degrees of freedom (equal to the number of constraints). This indicates little, if any, overall shift in attitudes toward abortion. The same holds for the health scale, for which the chi-squared value only reaches 2.26. Thus, in neither instance did the Court significantly alter the structure of public opinion toward abortion. While there is some evidence of the positive response effect in the health-scale model (all the signs become positive in the wake of *Webster*), the fact that no coefficient is significantly different from

zero suggests little aggregate increase in support for health-related abortions.

The most interesting finding here is that Catholics (who might be expected most likely to oppose abortion, see Gilbert 1993) did not seem to crystallize their beliefs in the wake of *Webster*. Even on the health-related abortion scale—where one may predict a general increase in the level of support for abortion—the Court elicited scant reaction. Furthermore, those groups most likely to support abortion rights (Protestants, those with high education, and females) barely reacted as well. Attitudes seem to have neither changed in the aggregate nor polarized between groups as a result of *Webster*.

In general, these findings clearly demonstrate that people who had heard of *Webster* responded significantly less to the Court's action than did people who had heard of *Roe*. While Catholics who had heard of *Webster* became slightly more opposed to discretionary abortions after the ruling, the evidence in Table 1 still indicates little support for the notion that the Court significantly altered group attitudes in general. Rather, the public hardly responded, which suggests that when the Court rules following a major decision (*Roe*), the public is not likely to react to its policy choice.

A FURTHER TEST: THE DEATH PENALTY

The results of the previous test suggest that the structural response hypothesis (explicated here as Hypothesis 1) cannot account for the insignificant shifts in public opinion toward abortion after *Webster*. This tells us that the Court's ability to affect public opinion toward abortion may be conditional. In other words, the Court may only affect public opinion under specific circumstances. At this point, however, we cannot claim that our approach has explanatory power beyond this specific issue. It may be that the Court's effect is unique to abortion because it is such a salient issue for so many people. To explore the general applicability of our hypotheses, we must test them in another issue area. If the results of additional tests mirror those from the abortion cases, then we have compelling evidence that the Court's ability to affect public opinion is conditioned on the temporal ordering of its decisions. To discern whether this effect holds, we turn to another salient issue area, the death penalty.

We begin with an analysis of how the Supreme Court affected public opinion toward the death penalty with its first landmark (and highly publicized) ruling on the constitutionality of this punishment—*Furman v. Georgia* (1972). Then we analyze whether the Court affected public opinion in two of its many subsequent capital punishment cases: *Gregg v. Georgia* (1976) and *McCleskey v. Kemp* (1987). We expect that *Furman* will elicit significant change in group attitudes and also will alter overall public opinion toward the death penalty (Hypothesis 1), but that after *Gregg* and *McCleskey* there will be little change on either level (Hypothesis 2).

Data for the death penalty analyses are drawn from the General Social Survey cumulative file, 1972–94 (Davis and Smith 1994). The GSS conducted interviews from February to April in 1972, 1973, 1976, 1977, 1987, and 1988.¹⁰ This allows for a comparison of public attitudes toward the death penalty several months before each of the decisions and then within a year afterward. The GSS also provides a number of useful measures for the purpose of testing our theory. Thus, we specify models that are very similar to the models used to test attitude change in the wake of *Webster*. The independent measures in these models are *Education*, *Gender*, *Race*, *Party Identification*, *Jewish Adherents*,¹¹ and *Frequency of Church Attendance*. These variables allow us to draw out the relationships among group membership, individual characteristics, and attitudes toward the death penalty. Again, we include a dummy variable to distinguish between pre- and postdecision attitudes.

The dependent measure is whether a respondent *Favors the Death Penalty* for convicted murderers.¹²

The dependent variable is coded 1 (favors the death penalty) or 0 (opposes this punishment). Given the dichotomous nature of this variable, an alternate to regression analysis is again warranted. We use binary probit models, which attempt to account fully for the relevant causal factors (see Greene 1993, 635–51 for the derivation and discussion of the probit model), and we estimate these models using maximum likelihood estimation. As discussed in the abortion section, the comparison of the constrained and unconstrained models allows us to discern whether the Court affected overall public opinion toward the death penalty.¹³

OPINION CHANGE AND DEATH PENALTY CASES

In *Furman v. Georgia*, the Court issued a short per curiam decision holding that Georgia laws governing the death penalty violated the Eighth Amendment protection against cruel and unusual punishment (see Epstein and Walker 1995). Table 2 presents the constrained and unconstrained models for public attitudes before and after *Furman*. Note that prior to this decision, females and nonwhites were significantly more opposed to capital punishment than were males or whites, and Republicans favored the death penalty more than did Democrats. These findings are intuitive and conform to existing theories concerning different group attitudes toward the death penalty (see, e.g., Epstein and Kobyłka 1992).

The postdecision coefficients in the unconstrained model help determine whether the structure of public opinion changed as a result of *Furman*. As Hypothesis 1 predicts, the decision did elicit specific social cleavages in two areas: Those with higher education clearly became more opposed to the death penalty than did those with less education, while partisan attitudes

the time of *Furman*, the question was: "Are you in favor of the death penalty for persons convicted of murder?" At the time of *Gregg* and *McCleskey*, the question was "Do you favor or oppose the death penalty for persons convicted of murder?" Since we are not comparing individual responses over time, the difference does not matter for our purposes.

¹³ Since the GSS does not provide a question for the death penalty that asks whether a respondent had heard of the Court's decision, it may be difficult to sort out the influence of the decision from the spurious influence of other factors (see Franklin and Kosaki 1989, 754–5). By not excluding individuals who had not heard about the particular death penalty cases, our models incur some degree of bias, specifically against Hypothesis 1 and toward Hypothesis 2. This means that our findings in support of Hypothesis 1 (an effect from *Furman*) could be stronger than they appear if these individuals were excluded from our sample. In other words, if we could include only those who had heard of the decision, then we would expect much stronger changes in group attitudes in the wake of the decision, because we would capture only the attitudes of those who probably cared about the decision. Our results are still strong, which means we overcome this bias against Hypothesis 1. Unfortunately, the bias toward Hypothesis 2 (no effect from *Gregg* and *McCleskey*) cannot be easily overcome because when all those who had not heard of the decision are included in the sample, it is much easier to find no effect. In short, if someone had not heard of the decision, there is little reason to assume an attitude change as a result of the decision (see Franklin and Kosaki 1989, 760). Nonetheless, since these cases were quite salient and were part of the public discourse, we are confident that this bias is not severe.

¹⁰ These data were provided by the Inter-university Consortium for Political and Social Research (Davis and Smith 1994). Recoded data may be obtained from the authors.

¹¹ We include Jewish adherents for reasons similar to including Catholic adherents in the abortion model. Just as Catholics tend to have very conservative views on abortion, Jews tend to have very liberal views opposing capital punishment (see, e.g., Melton 1989).

¹² The wording of this question in the GSS changed after 1973. At

toward capital punishment became more polarized. These findings support Hypothesis 1, as α_1 remains small, while some of the $\beta_{2,k}$ coefficients are large. Both models are significant, with chi-square values of 205.21 and 216.57, respectively.

To discern any overall shift in group attitudes toward capital punishment after *Furman*, we also compare the constrained and unconstrained models using the likelihood ratio test. The chi-square value for this test reaches 11.36 with five degrees of freedom (refer to Table 2). This suggests (with $p < .05$) that overall public opinion toward the death penalty changed as a result of *Furman*, the first major case in which the Court ruled on the constitutionality of the death penalty, which conforms to Franklin and Kosaki's (1989) finding based on *Roe*.

Since 1972 the Court has issued many additional opinions covering the death penalty, two of which are particularly important and salient: *Gregg v. Georgia* (1976) and *McCleskey v. Kemp* (1987).¹⁴ In *Gregg* the

¹⁴ We use *Gregg* because it seemed to settle the debate over the
